ANNUAL MESSAGE OF THE PRESIDENT.

TO THE SENATE AND HOUSE OF REPRESENTATIVES:

I sincerely regret that I cannot be present at the opening of this session of the Congress. I am thus prevented from presenting in as direct a way as I could wish the many questions that are pressing for solution at this time. Happily, I have had the advantage of the advice of the heads of the several executive departments who have kept in close touch with affairs in their detail and whose thoughtful recommendations I earnestly second.

In the matter of the railroads and the readjustment of their affairs growing out of federal control, I shall take the liberty at a later date of addressing you.

I hope that Congress will bring to a conclusion at this session legislation looking to the establishment of a budget system. That there should be one single authority responsible for the making of all appropriations and that appropriations should be made not independently of each other, but with reference to one single comprehensive plan of expenditure properly related to the nation's income, there can be no doubt. I believe the burden of preparing the budget must, in the nature of the case, if the work is to be properly done and responsibility concentrated instead of divided, rest upon the executive. The budget so prepared should be submitted to and approved or amended by a single committee of each House of Congress and no single appropriation should be made by the Congress, except such as may have been included in the budget prepared by the executive or added by the particular committee of Congress charged with the budget legislation.

Another and not less important aspect of the problem is the ascertainment of the economy and efficiency with which the moneys appropriated are expended. Under existing law the only audit is for the purpose of ascertaining whether expenditures have been lawfully made within the appropriations. No one is authorized or equipped

to ascertain whether the money has been spent wisely, economically and effectively. The auditors should be highly trained officials with permanent tenure in the Treasury Department, free of obligations to or motives of consideration for this or any subsequent administration, and authorized and empowered to examine into and make report upon the methods employed and the results obtained by the executive departments of the Government. Their reports should be made to the Congress and to the Secretary of the Treasury.

I trust that the Congress will give its immediate consideration to the problem of future taxation. Simplification of the income and profits taxes has become an immediate necessity. These taxes performed indispensable service during the war. They must, however, be simplified, not only to save the taxpayer inconvenience and expense, but in order that his liability may be made certain and definite.

With reference to the details of the Revenue Law, the Secretary of the Treasury and the Commissioner of Internal Revenue will lay before you for your consideration certain amendments necessary or desirable in connection with the administration of the law—recommendations which have my approval and support. It is of the utmost importance that in dealing with this matter the present law should not be disturbed so far as regards taxes for the calendar year 1920, payable in the calendar year 1921. The Congress might well consider whether the higher rates of income and profits taxes can in peace times be effectively productive of revenue, and whether they may not, on the contrary, be destructive of business activity and productive of waste and inefficiency. There is a point at which in peace times high rates of income and profits taxes discourage energy, remove the incentive to new enterprise, encourage extravagant expenditures and produce industrial stagnation with consequent unemployment and other attendant evils.

The problem is not an easy one. A fundamental change has taken place with reference to the position of America in the world's affairs. The prejudice and passions engendered by decades of controversy between two schools of political and economic thought,—the one believers in protection of American industries, the other believers in tariff for revenue only,—must be subordinated to the single consideration of the public interest in the light of utterly changed conditions. Before the war America was heavily the debtor of the rest of the world and the interest payments she had to make to foreign countries on American securities held abroad, the expenditures of American travelers abroad and the ocean freight charges she had to pay to others, about balanced the value of her pre-war favorable balance of trade. During the war America's exports have been greatly stimulated, and increased prices have increased their value. On the other

hand, she has purchased a large proportion of the American securities previously held abroad, has loaned some \$9,000,000,000 to foreign governments, and has built her own ships. Our favorable balance of trade has thus been greatly increased and Europe has been deprived of the means of meeting it heretofore existing. Europe can have only three ways of meeting the favorable balance of trade in peace times: by imports into this country of gold or of goods, or by establishing new credits. Europe is in no position at the present time to ship gold to us nor could we contemplate large further imports of gold into this country without concern. The time has nearly passed for international governmental loans and it will take time to develop in this country a market for foreign securities. Anything, therefore, which would tend to prevent foreign countries from settling for our exports by shipments of goods into this country could only have the effect of preventing them from paying for our exports and therefore of preventing the exports from being made. The productivity of the country greatly stimulated by the war must find an outlet by exports to foreign countries and any measures taken to prevent imports will inevitably curtail exports, force curtailment of production, load the banking machinery of the country with credits to carry unsold products and produce industrial stagnation and unemployment. If we want to sell, we must be prepared to buy. Whatever, therefore, may have been our views during the period of growth of American business concerning tariff legislation, we must now adjust our own economic life to a changed condition growing out of the fact that American business is full grown and that America is the greatest capitalist in the world.

No policy of isolation will satisfy the growing needs and opportunities of America. The provincial standards and policies of the past, which have held American business as if in a strait-jacket, must yield and give way to the needs and exigencies of the new day in which we live, a day full of hope and promise for American business, if we will but take advantage of the opportunities that are ours for the asking. The recent war has ended our isolation and thrown upon us a great duty and responsibility. The United States must share the expanding world market. The United States desires for itself only equal opportunity with the other nations of the world, and that through the process of friendly cooperation and fair competition the legitimate interests of the nations concerned may be successfully and equitably adjusted.

There are other matters of importance upon which I urged action at the last session of Congress which are still pressing for solution. I am sure it is not necessary for me again to remind you that there is one immediate and very practicable question resulting from the

war which we should meet in the most liberal spirit. It is a matter of recognition and relief to our soldiers. I can do no better than to quote from my last message urging this very action:

"We must see to it that our returning soldiers are assisted in every practicable way to find the places for which they are fitted in the daily work of the country. This can be done by developing and maintaining upon an adequate scale the admirable organization created by the Department of Labor for placing men seeking work; and it can also be done, in at least one very great field, by creating new opportunities for individual enterprise. The Secretary of the Interior has pointed out the way by which returning soldiers may be helped to find and take up land in the hitherto undeveloped regions of the country which the Federal Government has already prepared or can readily prepare for cultivation and also on many of the cutover or neglected areas which lie within the limits of the older states: and I once more take the liberty of recommending very urgently that his plans shall receive the immediate and substantial support of the Congress."

In the matter of tariff legislation, I beg to call your attention to the statements contained in my last message urging legislation with reference to the establishment of the chemical and dyestuffs industry in America:

"Among the industries to which special consideration should be given is that of the manufacture of dyestuffs and related chemicals. Our complete dependence upon German supplies before the war made the interruption of trade a cause of exceptional economic disturbance. The close relation between the manufacture of dyestuffs, on the one hand, and of explosives and poisonous gases, on the other, moreover, has given the industry an exceptional significance and value. Although the United States will gladly and unhesitatingly join in the programme of international disarmament, it will, nevertheless, be a policy of obvious prudence to make certain of the successful maintenance of many strong and well-equipped chemical plants. The German chemical industry, with which we will be brought into competition, was and may well be again, a thoroughly knit monopoly capable of exercising a competition of a peculiarly insidious and dangerous kind."

During the war the farmer performed a vital and willing service to the nation. By materially increasing the production of his land, he supplied America and the Allies with the increased amounts of food necessary to keep their immense armies in the field. He indispensably helped to win the war. But there is now scarcely less need of increasing the production in food and the necessities of life. I ask the Congress to consider means of encouraging effort along these

lines. The importance of doing everything possible to promote production along economical lines, to improve marketing, and to make rural life more attractive and healthful, is obvious. I would urge approval of the plans already proposed to the Congress by the Secretary of Agriculture, to secure the essential facts required for the proper study of this question, through the proposed enlarged programmes for farm management studies and crop estimates. I would urge, also, the continuance of federal participation in the building of good roads, under the terms of existing law and under the direction of present agencies; the need of further action on the part of the States and the Federal Government to preserve and develop our forest resources, especially through the practice of better forestry methods on private holdings and the extension of the publicly owned forests; better support for country schools and the more definite direction of their courses of study along lines related to rural problems; and fuller provision for sanitation in rural districts and the building up of needed hospital and medical facilities in these localities. Perhaps the way might be cleared for many of these desirable reforms by a fresh, comprehensive survey made of rural conditions by a conference composed of representatives of the farmers and of the agricultural agencies responsible for leadership.

I would call your attention to the widespread condition of political restlessness in our body politic. The causes of this unrest, while various and complicated, are superficial rather than deep seated. Broadly, they arise from or are connected with the failure on the part of our Government to arrive speedily at a just and permanent peace permitting return to normal conditions, from the transfusion of radical theories from seething European centers pending such delay, from heartless profiteering resulting in the increase of the cost of living, and lastly from the machinations of passionate and malevolent agitators. With the return to normal conditions, this unrest will rapidly disappear. In the meantime, it does much evil. It seems to me that in dealing with this situation Congress should not be impatient or drastic but should seek rather to remove the causes. It should endeavor to bring our country back speedily to a peace basis, with ameliorated living conditions under the minimum of restrictions upon personal liberty that is consistent with our reconstruction problems. And it should arm the Federal Government with power to deal in its criminal courts with those persons who by violent methods would abrogate our time-tested institutions. With the free expression of opinion and with the advocacy of orderly political change, however fundamental, there must be no interference, but towards passion and malevolence tending to incite crime and insurrection under guise of political evolution there should be no

leniency. Legislation to this end has been recommended by the Attorney General and should be enacted. In this direct connection, I would call your attention to my recommendations on August 8th, pointing out legislative measures which would be effective in controlling and bringing down the present cost of living, which contributes so largely to this unrest. On only one of these recommendations has the Congress acted. If the Government's campaign is to be effective, it is necessary that the other steps suggested should be acted on at once.

I renew and strongly urge the necessity of the extension of the present Food Control Act as to the period of time in which it shall remain in operation. The Attorney General has submitted a bill providing for an extension of this Act for a period of six months. As it now stands it is limited in operation to the period of the war and becomes inoperative upon the formal proclamation of peace. It is imperative that it should be extended at once. The Department of Justice has built up extensive machinery for the purpose of enforcing its provisions; all of which must be abandoned upon the conclusion of peace unless the provisions of this Act are extended.

During this period the Congress will have an opportunity to make similar, permanent provisions and regulations with regard to all goods destined for interstate commerce and to exclude them from interstate shipment, if the requirements of the law are not complied with. Some such regulation is imperatively necessary. The abuses that have grown up in the manipulation of prices by the withholding of foodstuffs and other necessities of life cannot otherwise be effectively prevented. There can be no doubt of either the necessity or the legitimacy of such measures.

As I pointed out in my last message, publicity can accomplish a great deal in this campaign. The aims of the Government must be clearly brought to the attention of the consuming public, civic organizations and state officials, who are in a position to lend their assistance to our efforts. You have made available funds with which to carry on this campaign, but there is no provision in the law authorizing their expenditure for the purpose of making the public fully informed about the efforts of the Government. Specific recommendation has been made by the Attorney General in this regard. I would strongly urge upon you its immediate adoption, as it constitutes one of the preliminary steps to this campaign.

I also renew my recommendation that the Congress pass a law regulating cold storage as it is regulated, for example, by the laws of the State of New Jersey, which limit the time during which goods may be kept in storage, prescribe the method of disposing of them if kept beyond the permitted period, and require that goods released from storage shall in all cases bear the date of their receipt. It would

materially add to the serviceability of the law, for the purpose we now have in view, if it were also prescribed that all goods released from storage for interstate shipment should have plainly marked upon each package the selling or market price at which they went into storage. By this means the purchaser would always be able to learn what profits stood between him and the producer or the wholesale dealer.

I would also renew my recommendation that all goods destined for interstate commerce should in every case, where their form or package makes it possible, be plainly marked with the price at which they left the hands of the producer.

We should formulate a law requiring a federal license of all corporations engaged in interstate commerce and embodying in the license, or in the conditions under which it is to be issued, specific regulations designed to secure competitive selling and prevent unconscionable profits in the method of marketing. Such a law would afford a welcome opportunity to effect other much needed reforms in the business of interstate shipment and in the methods of corporations which are engaged in it; but for the moment I confine my recommendations to the object immediately in hand, which is to lower the cost of living.

No one who has observed the march of events in the last year can fail to note the absolute need of a definite programme to bring about an improvement in the conditions of labor. There can be no settled conditions leading to increased production and a reduction in the cost of living if labor and capital are to be antagonists instead of partners. Sound thinking and an honest desire to serve the interests of the whole nation, as distinguished from the interests of a class, must be applied to the solution of this great and pressing problem. The failure of other nations to consider this matter in a vigorous way has produced bitterness and jealousies and antagonisms, the food of radicalism. The only way to keep men from agitating against grievances is to remove the grievances. An unwillingness even to discuss these matters produces only dissatisfaction and gives comfort to the extreme elements in our country which endeavor to stir up disturbances in order to provoke governments to embark upon a course of retaliation and repression. The seed of revolution is repression. The remedy for these things must not be negative in character. It must be constructive. It must comprehend the general interest. The real antidote for the unrest which manifests itself is not suppression, but a deep consideration of the wrongs that beset our national life and the application of a remedy.

Congress has already shown its willingness to deal with these industrial wrongs by establishing the eight-hour day as the standard in every field of labor. It has sought to find a way to prevent child

labor. It has served the whole country by leading the way in developing the means of preserving and safeguarding lives and health in dangerous industries. It must now help in the difficult task of finding a method that will bring about a genuine democratization of industry, based upon the full recognition of the right of those who work, in whatever rank, to participate in some organic way in every decision which directly affects their welfare. It is with this purpose in mind that I called a conference to meet in Washington on December 1st, to consider these problems in all their broad aspects, with the idea of bringing about a better understanding between these two interests.

The great unrest throughout the world, out of which has emerged a demand for an immediate consideration of the difficulties between capital and labor, bids us put our own house in order. Frankly, there can be no permanent and lasting settlements between capital and labor which do not recognize the fundamental concepts for which labor has been struggling through the years. The whole world gave its recognition and endorsement to these fundamental purposes in the League of Nations. The statesmen gathered at Versailles recognized the fact that world stability could not be had by reverting to industrial standards and conditions against which the average workman of the world had revolted. It is, therefore, the task of the statesmen of this new day of change and readjustment to recognize world conditions and to seek to bring about, through legislation, conditions that will mean the ending of age-long antagonisms between capital and labor and that will hopefully lead to the building up of a comradeship which will result not only in greater contentment among the mass of workmen but also bring about a greater production and a greater prosperity to business itself.

To analyze the particulars in the demands of labor is to admit the justice of their complaint in many matters that lie at their basis. The workman demands an adequate wage, sufficient to permit him to live in comfort, unhampered by the fear of poverty and want in his old age. He demands the right to live and the right to work amidst sanitary surroundings, both in home and in workshop, surroundings that develop and do not retard his own health and well-being; and the right to provide for his children's wants in the matter of health and education. In other words, it is his desire to make the conditions of his life and the lives of those dear to him tolerable and easy to bear.

The establishment of the principles regarding labor laid down in the covenant of the League of Nations offers us the way to industrial peace and conciliation. No other road lies open to us. Not to pursue this one is longer to invite enmities, bitterness, and antagonisms which in the end only lead to industrial and social disaster.

The unwilling workman is not a profitable servant. An employee whose industrial life is hedged about by hard and unjust conditions, which he did not create and over which he has no control, lacks that fine spirit of enthusiasm and volunteer effort which are the necessary ingredients of a great producing entity. Let us be frank about this solemn matter. The evidences of world-wide unrest which manifest themselves in violence throughout the world bid us pause and consider the means to be found to stop the spread of this contagious thing before it saps the very vitality of the nation itself. Do we gain strength by withholding the remedy? Or is it not the business of statesmen to treat these manifestations of unrest which meet us on every hand as evidences of an economic disorder and to apply constructive remedies wherever necessary, being sure that in the application of the remedy we touch not the vital tissues of our industrial and economic life? There can be no recession of the tide of unrest until constructive instrumentalities are set up to stem that tide.

Governments must recognize the right of men collectively to bargain for humane objects that have at their base the mutual protection and welfare of those engaged in all industries. Labor must not be longer treated as a commodity. It must be regarded as the activity of human beings, possessed of deep yearnings and desires. The business man gives his best thought to the repair and replenishment of his machinery, so that its usefulness will not be impaired and its power to produce may always be at its height and kept in full vigor and motion. No less regard ought to be paid to the human machine, which after all propels the machinery of the world and is the great dynamic force that lies back of all industry and progress. Return to the old standards of wage and industry in employment are unthinkable. The terrible tragedy of war which has just ended and which has brought the world to the verge of chaos and disaster would be in vain if there should ensue a return to the conditions of the past. Europe itself, whence has come the unrest which now holds the world at bay, is an example of standpatism in these vital human matters which America might well accept as an example, not to be followed but studiously to be avoided. Europe made labor the differential, and the price of it all is enmity and antagonism and prostrated industry. The right of labor to live in peace and comfort must be recognized by governments and America should be the first to lay the foundation stones upon which industrial peace shall be built.

Labor not only is entitled to an adequate wage, but capital should receive a reasonable return upon its investment and is entitled to protection at the hands of the government in every emergency. No government worthy of the name can "play" these elements against

each other, for there is a mutuality of interest between them which the government must seek to express and to safeguard at all cost.

The right of individuals to strike is inviolate and ought not to be interfered with by any process of government, but there is a predominant right and that is the right of the government to protect all of its people and to assert its power and majesty against the challenge of any class. The government, when it asserts that right, seeks not to antagonize a class but simply to defend the right of the whole people as against the irreparable harm and injury that might be done by the attempt by any class to usurp a power that only government itself has a right to exercise as a protection to all.

In the matter of international disputes which have led to war, statesmen have sought to set up as a remedy arbitration for war. Does this not point the way for the settlement of industrial disputes, by the establishment of a tribunal, fair and just alike to all, which will settle industrial disputes which in the past have led to war and disaster? America, witnessing the evil consequences which have followed out of such disputes between these contending forces, must not admit itself impotent to deal with these matters by means of peaceful processes. Surely, there must be some method of bringing together in a council of peace and amity these two great interests, out of which will come a happier day of peace and cooperation, a day that will make men more hopeful and enthusiastic in their various tasks, that will make for more comfort and happiness in living and a more tolerable condition among all classes of men. Certainly human intelligence can devise some acceptable tribunal for adjusting the differences between capital and labor.

This is the hour of test and trial for America. By her prowess and strength, and the indomitable courage of her soldiers, she demonstrated her power to vindicate on foreign battlefields her conceptions of liberty and justice. Let not her influence as a mediator between capital and labor be weakened and her own failure to settle matters of purely domestic concern be proclaimed to the world. There are those in this country who threaten direct action to force their will upon a majority. Russia today, with its blood and terror, is a painful object lesson of the power of minorities. It makes little difference what minority it is; whether capital or labor, or any other class; no sort of privilege will ever be permitted to dominate this country. We are a partnership or nothing that is worth while. We are a democracy, where the majority are the masters, or all the hopes and purposes of the men who founded this government have been defeated and forgotten. In America there is but one way by which great reforms can be accomplished and the relief sought by classes obtained, and that is through the orderly processes of representative government. Those who would propose any other method of reform

are enemies of this country. America will not be daunted by threats nor lose her composure or calmness in these distressing times. We can afford, in the midst of this day of passion and unrest, to be self-contained and sure. The instrument of all reform in America is the ballot. The road to economic and social reform in America is the straight road of justice to all classes and conditions of men. Men have but to follow this road to realize the full fruition of their objects and purposes. Let those beware who would take the shorter road of disorder and revolution. The right road is the road of justice and orderly process.

WOODROW WILSON.

THE WHITE HOUSE,
2 December, 1919.

REPORT OF THE SECRETARY OF THE TREASURY.

ANNUAL REPORT ON THE FINANCES.

TREASURY DEPARTMENT,

Washington, November 20, 1919.

SIR: I have the honor to make the following report:

FINANCIAL CONDITIONS AND THE TREASURY'S PROGRAM.

In this period of readjustment from war to peace, of reconstruction of regions swept bare by the havoc of the greatest war of all time, of political and economic change, and of world-wide unrest and anxiety, America stands strong economically, financially, and politically among the nations of the earth. She has emerged from the colossal struggle with strength tested and unimpaired. The impious hand of the enemy has not touched any part of her fair land, and there are no waste places here to restore. A large share of the cost of the war already has been paid for by taxes and the public debt is but a fraction of our national wealth, our credit and financial structure is sound and secure, our gold reserves are the greatest in the world, prosperity flourishes in every branch of industry and in every part of the Nation, and the people of the country are fully employed.

On the other hand, there are serious and grave problems that challenge our statesmanship and our patriotism. In the train of the great physical and spiritual effort the Nation put forth in the supreme task of winning the war, it is not surprising, in the light of the experience of mankind following wars of every age, that there should appear a certain spirit of reaction that finds its concomitant in discontent and dissatisfaction. The continuation of prosperity and the financing of our domestic and foreign trade, the full and peaceful employment of labor and capital, credit expansion, speculation and the cost of living are great social and economic problems, but they are susceptible of American solution. To entertain the thought of failure in finding an effective remedy for every phase of discord and dissatisfaction in America is to shatter the hopes of mankind. The answer to these great questions, which are far less grave in the United States than elsewhere in the world, is to be found in the courage and ability and spirit of Americans and their love of the United States. These are attributes which have stood the test of time from the birth of thirteen struggling colonies to the maturity of a great nation. The men who went to Europe to fight for the freedom of the world, and their compatriots who mobilized to support them to the utmost at home, will not be

found wanting in these critical times and can be relied upon to grapple with these questions in the same indomitable and loyal spirit that won the war and with the traditional appreciation and respect of Americans for the rights of their fellowmen, in full confidence of the vindication of right and justice in every element of our life as a nation.

This spirit of optimism and hopefulness is born of the Nation's performances of the past and has its immediate revival in the great achievements of the people during the war and in the index afforded by the Treasury's favorable outlook for the future, if our course is directed along intelligent lines of efficiency and rigorous economy in public and private finance. During the 19 months of active warfare, the people of the country cheerfully contributed taxes for the support of the Government in greater measure than ever before in our history, and generously subscribed to four great popular Liberty loans. The success of these stupendous operations was made possible only by the devoted patriotism of the American people. In the highest and truest sense, the people of the country financed the war, and they deserve the credit for the great achievement. The loyal and efficient work of the organization in the Treasury, the Federal reserve banks and the Liberty loan committees, great and effective as it was, would have amounted to naught had it not sounded the note of patriotic appeal.

Since the signing of the armistice, taxes have been paid with equal willingness in even larger amounts than during the period of hostilities, although not so great as would have been necessary if the war had continued. During the year that has elapsed since the previous report of the Secretary of the Treasury, it has been necessary to issue only one popular loan—short-term Victory Liberty notes—as compared with four issues of long-term bonds in the previous 19 months. In the face of many gloomy forecasts that the Victory issue must be sold on a strictly commercial basis and that it would be impossible again to appeal to the patriotism of the American people, the loan, launched without the impulse of the enthusiasm of war, was another overwhelming success that again reflected the financial and economic strength of America and the solidarity and patriotism of the people of the country.

Tax receipts, payments of Victory loan subscriptions and the diminishing expenditures of the Government have permitted the issue of Treasury certificates of indebtedness on a decreasing scale for the purposes of temporary financing. This has been particularly true since the close of the fiscal year 1919. On October 31, 1919, the total amount of outstanding Treasury certificates, which on April 30 aggregated \$6,250,000,000, had been reduced to \$3,736,352,300, of which only \$1,634,671,000 were loan certificates. There are no maturities

of certificates to provide for prior to 1920, as the certificates maturing December 15, 1919, are more than covered by the income and profits tax installment due on that date.

In these circumstances, it is believed that the time will soon be in sight when the expenditures of the Government, including interest and sinking fund charges on the public debt, may be met by current receipts, without incurring new floating debt except Treasury certificates of indebtedness issued in anticipation of income and profits taxes. I confidently expect that by the time the cumulative sinking fund begins to operate on July 1, 1920, temporary financing will be substantially over and the certificates will have disappeared from the market except to the extent that financing may be done and certificates issued in anticipation of income and profits taxes. That is the goal toward which the Treasury is aiming, but its realization is dependent upon the continuation of taxes at the present aggregate level and the vigorous enforcement of economy.

The Treasury's financial program can best be expounded in detail through various public letters setting forth the facts as they developed in gradual stages during the early months of the current fiscal year. The condition of the Treasury and the state of the public debt on June 30, 1919, was analyzed in a letter sent to the Chairmen of the Senate Committee on Finance and the House Committee on Ways and Means early in July. That statement revealed that the Treasury was on the threshold of a more favorable period and enabled the department to confirm the announcement which had been made on April 14, 1919, to the effect that the issue of Victory notes would be the last Liberty loan and further to point out that while the ultimate amount of expenditures for the fiscal year 1920 was uncertain, it was confidently expected that the Government would be able, not only to meet its further temporary requirements for the decreasing scale of expenditure by the sale of Treasury certificates of indebtedness bearing interest at the rate of $4\frac{1}{2}$ per cent or less, but also to fund as many of these as may be desirable by the issue of short-term notes, in moderate amounts, at convenient intervals, when market conditions were favorable and upon terms advantageous to the Government.

The above announcement was the most encouraging news from the viewpoint of Government finance that the country had received since the cessation of hostilities. It was closely followed on July 25, 1919, with a statement that, allowing for all the elements of uncertainty, the Treasury had no reason to believe that the expenditures of the Government during the fiscal year 1920 would exceed the amount of revenue to be received under existing law and from the remaining installments of the Victory Liberty loan. This would mean a deficit for the year of only \$1,032,000,000 and a net increase

in the gross public debt at the end of the year by that figure, which was the amount of the deferred installments of the Victory Liberty loan. This estimate was contained in an open letter to the banking institutions of the country apprising them of the financial program for the ensuing five months, including the period of heaviest expenditure during the fiscal year 1920. The plan contemplated the resumption of the issue of loan certificates after an interval of three months, during which it had been possible to suspend the issue of such certificates by reason of the rapid decrease in the current expenditures of the Government, the very large early payments on the Victory loan, and the ready sale of tax certificates.

The progress of the certificate program and the success of the first two issues of certificates in pursuance of the plan were such as to permit the following announcement on August 25, 1919, in which the banking institutions of the country were informed that the third semimonthly issue, dated September 2, would be offered without asking them to subscribe for any specified quota:

The second semimonthly issue of Treasury certificates of indebtedness (Series B, 1920) in pursuance of the program for financing the current necessities of the Government set forth in Secretary Glass's letter of July 25, 1919, to all banks and trust companies, was oversubscribed.

The splendid response of the banking institutions of the country to the Treasury's plan for financing the current needs of the Government as set out in the Secretary's circular letter of July 25, gives assurance that the Treasury may count upon unqualified and ample support whenever needed. The success of the first two issues, which realized a total of \$1,065,953,500, has placed the Treasury in a very satisfactory cash position. This makes it possible to make the following announcements as to the program for the next few weeks:

1. There will be no fixed minimum amount for the issue of loan certificates dated September 2 and maturing February 2 (Series C, 1920). The issue will not remain open for any stated period, but will be closed without notice. Federal reserve banks will not assign quota in respect to this issue to the banking institutions of their districts.

2. There will be no issue of loan certificates upon September 15. An issue or issues of tax certificates of longer maturity may be substituted.

3. The Secretary of the Treasury has authorized the Federal reserve banks on and after Tuesday, September 2, to redeem in cash before maturity at the holder's option, at par and accrued interest to the date of such optional redemption, Treasury certificates of indebtedness of Series V J, dated April 10, 1919, and maturing September 9, 1919.

This offering of certificates without suggesting to the banks the amount that should be subscribed was a very great success and further reflected the splendid condition of the Government's credit, the investment value of these securities and the increased marketability of the certificates through redistribution by the banks to investors.

The large subscription of the three issues of certificates dated August 1, August 15, and September 2, the fortunate cash position of the Treasury, and the increasing investment demand enabled the de-

partment to advance another important step forward in the gradually developing program that was taking the Treasury out of the securities market to the greatest extent possible and revealing the continuing improvement in the situation. On September 8, the plan, as had been customary from the beginning, was varied by suspending the sale of loan certificates for the time being and offering two series of tax certificates, both dated September 15, 1919, one series maturing in six months and bearing interest at the rate of $4\frac{1}{4}$ per cent, and the other maturing in one year and bearing interest at the rate of $4\frac{1}{2}$ per cent. This was the first time in over a year that certificates had been offered at less than $4\frac{1}{2}$ per cent. In addition, it was announced that all certificate maturities prior to 1920 were provided for from tax receipts or cash in bank, which was further evidence of progress in the policy of financing the balance of the war debt so as to avoid great refunding operations by spreading maturities and meeting them, so far as may be, from tax receipts.

The response to these two offerings of tax certificates was so great that it was found desirable to close the issue in three days after September 15. The total subscriptions aggregated \$758,600,500, of which \$101,131,500 represented the $4\frac{1}{4}$ per cent six-month series and \$657,469,000 the $4\frac{1}{2}$ per cent one-year series. In view of the success of the issues it was possible to suspend for another period the offering of further loan certificates.

The international financial situation.

The international financial situation is one of great importance and in which we are seriously interested. The present position relative to foreign financing and the general policy of the Treasury concerning this vital problem should be fully stated.

Since the armistice the United States has advanced to the Governments of the Allies, as of the close of business October 31, 1919, the sum of \$2,329,257,138.55, and there remained on that date an unexpended balance of \$593,628,111.45, from the total loans of \$10,000,000,000 authorized under the Liberty loan acts.

The Treasury asked and obtained power for the War Finance Corporation to make advances up to the amount of \$1,000,000,000 for nonwar purposes and the War Finance Corporation is prepared to make such advances.

By the act approved September 17, 1919, the Federal Reserve Board is authorized to permit, until January 1, 1921, national banks to invest to a limited extent in the stock of American corporations principally engaged in such phases of international or foreign financial operations as may be necessary to facilitate exports.

The Secretary of War is authorized to sell surplus Army stores on credit.

The United States wheat director is authorized to sell wheat to Europe on credit.

The power which at present exists in the Government or governmental agencies to assist in meeting Europe's financial needs is, therefore, considerable. This power must, of course, be exercised with extreme caution and with the most careful regard for the urgent needs of our own people for an ample supply of foodstuffs and other necessities of life at reasonable prices.

The Treasury is considering with representatives of the Governments of the Allies the funding of the demand obligations which the United States holds into long-time obligations, and at the same time the funding during the reconstruction period, or say for a period of two or three years, of the interest on the obligations of foreign Governments acquired by the United States under the Liberty loan acts.

The Treasury believes that the need of Europe for financial assistance, very great and very real though it is, has been much exaggerated both here and abroad. Our hearts have been so touched by the suffering which the war left in its train, and our experience is so recent of the financial conditions which existed during the war (when men were devoting themselves to the business of destruction) that we are prone to overlook the vast recuperative power inherent in any country which, though devastated, has not been depopulated, and the people of which are not starved afterwards. We must all feel deep sympathy for the suffering in Europe to-day, but we must not allow our sympathy to warp our judgment and, by exaggerating Europe's financial needs, make it more difficult to fill them.

Men must go back to work in Europe, must contribute to increase production. The industries of Europe, of course, can not be set to work without raw materials, machinery, etc., and, to the extent that these are to be secured from the United States, the problem of financing the restoration of Europe belongs primarily to our exporters. Governmental financial assistance in the past and talk of plans for future Government or banking aid to finance exports have apparently led our industrial concerns to the erroneous expectation that their war profits, based so largely on exports, will continue indefinitely without effort or risk on their part. To them will fall the profits of the exports and upon them will fall the consequences of failure to make the exports. So soon as domestic stocks, which were very low at the time of the armistice, have been replenished, those industries which have been developed to meet a demand for great exports, paid for out of Government war loans, will be forced to close plants and forego dividends unless they maintain and develop an outlet abroad. The industries of the country must be brought to a realization of the gravity of this problem, must go out and seek markets abroad, must reduce prices at home and abroad to a reasonable level, and create

or cooperate in creating the means of financing export business. There is no reason for high commodity prices in the specter of European demand nor for high interest rates in the specter of European credits. Our fear must be that the cessation of war exports will result in closed plants, passed dividends, and general depression. The way to avoid those evils is to stimulate production and encourage industrial and commercial activity and not to burden them with high interest rates which are a deterrent to these things, but unfortunately are not a deterrent, except temporarily, in such times as these to speculation.

Since armistice day, the consistent policy of the Treasury has been, so far as possible, to restore private initiative and remove governmental controls and interferences. It has been the view of the Treasury that only thus can the prompt restoration of healthy economic life be gained. The embargoes on gold and silver and control of foreign exchange have been removed, as well as the voluntary and informal control of call money and the stock exchange loan account. The control exercised by the Capital Issues Committee over capital issues has been discontinued. Thus the financial markets of the United States have been opened to the whole world and all restrictions removed that might have hindered America's capital and credit resources, as well as its great gold reserve, from being available in aid of the world's commerce and Europe's need.

There are those who believe that the dollar should be kept at par—no more, no less—in the market of foreign exchange. If effective action were taken to carry out such a policy, it could only be done by drawing gold out of the United States when the dollar would otherwise be at a discount and by inflating credit when the dollar would otherwise be at a premium.

The dollar is now at a premium almost everywhere in the world. Its artificial reduction and maintenance at the gold par of exchange in all currencies is quite unthinkable unless we propose to level all differences in the relative credit of nations and for our gold reserve substitute a reserve consisting of the promises to pay of any nation that chooses to become our debtor. Inequalities of exchange reflect not only the trade and financial balance between two countries, but, particularly after a great war such as that we have been through, the inequalities of domestic finance. The United States has met a greater proportion of the cost of the war from taxes and bond issues than any other country. Largely as a consequence of this policy, the buying power of the dollar at home has been better sustained than has the buying power at home of the currency of any European belligerent. For the United States to determine by governmental action to depress the dollar as measured in terms of foreign exchange and to improve the position of other currencies as measured

in terms of dollars would be to shift to the American people the tax and loan burdens of foreign countries. This shifted burden would be measured by the taxes to be imposed and the further loans to be absorbed by our people as a consequence, and by increased domestic prices.

United States Government action at this time to prevent in respect to foreign exchange the ordinary operation of the law of supply and demand, which automatically sets in action corrective causes, and to prevent the dollar from going to a premium when its natural tendency is to do so, would artificially stimulate our exports, and, through the competition of export demand with domestic demand, maintain or increase domestic prices.

The view of the Governments of the Allies, I take it, is that had they (after the war control of their imports had been relaxed) attempted to continue to "peg" their exchanges here at an artificial level by Government borrowing, the effect would have been to stimulate their imports and discourage their exports, thus aggravating their already unfavorable international balances.

It is not, of course, to be expected that the breach left by the withdrawal of governmental support of exchange can be filled by private initiative until the ratification of the treaty of peace has given reasonable assurance against the political risk which, rather than any commercial or credit risk, now deters private lenders. Some progress has already been made in placing here through private channels the loans of allied and neutral European countries and municipalities. The Treasury favors the making, in our markets, of such loans, which contribute to relieve the exchanges. I am sure that when peace is consummated, and the political risk measurably removed, American exporters and European importers will lay the basis of credit in sound business transactions, and I know that American bankers will not fail then to devise means of financing the needs of the situation nor American investors to respond to Europe's demand for capital on a sound investment basis.

Meanwhile it is well to remember the invisible factors, which are always at work toward a solution of the problem. Immigrants' remittances to Europe are, and will continue to be, a very large item in rectifying the exchanges. As soon as peace is concluded foreign travel will be a further item. Another very important factor is the purchase of European securities and properties and repurchase of foreign-held American securities by American investors. But the principal factor in Europe's favor is the inevitable curtailment of her imports and expansion of her exports. These processes, of course, are stimulated by the very position of the exchanges which they tend to correct.

The exchange situation as it exists to-day and the steps which were taken for the removal of all war restrictions as rapidly as conditions would warrant may be summarized as follows:

On May 6, 1919, the Federal Reserve Board announced that thereafter licenses for the export of silver bullion or silver coin of foreign mintage would be granted freely and without condition. This was followed on June 9, 1919, by the announcement that after consultation with the Secretary of the Treasury, and with his approval, the Federal Reserve Board had recommended to the President, and the President had approved the recommendation, that the control theretofore exercised over transactions in foreign exchange and over the exportation of coin, bullion, and currency be terminated except as to the importation or exportation of ruble notes or exchange transactions with that part of Russia under the control of the so-called Bolshevik government, and except as to exchange transactions with territories in respect of which such transactions were at that time permitted only through the American Relief Administration. At the same time it was announced that until formal action was taken by the President applications for the export of gold would, like applications for the export of silver, be freely granted irrespective of amount or destination except as above stated, and that during that interim licenses required to consummate specific transactions in foreign exchange would be freely granted, except as set forth above.

On June 26, 1919, the President issued a proclamation, giving effect to the above recommendations. This was followed by the removal by the Federal Reserve Board, on June 30, of the restrictions on remittances to countries to which remittances had theretofore been permitted only through the American Relief Administration, leaving in force and effect only the prohibition against the shipment of "coin, bullion, and currency to that part of Russia now under the control of the so-called Bolshevik government, and any and all dealings or exchange transactions in Russian rubles or transfer of credit or exchange transactions with that part of Russia now under the control of the so-called Bolshevik government." On August 12, the Federal Reserve Board announced the issuance of a general license permitting the exportation from the United States of Russian rubles, provided that notice of such exportations be given to the Customs Division of the Treasury and to the Division of Foreign Exchange of the Federal Reserve Board. With the exceptions above noted, therefore, there is now no control over foreign exchange or the export of coin, bullion, or currency.

The improvement of our exchanges with neutral countries and the decline to normal, and in many cases to a very considerable discount, of the currencies of those countries which had been ruling at

considerable premium in the United States, is illustrated by the following table showing (1) the highest premiums reached by certain foreign currencies between April, 1917, and July 31, 1918; (2) the highest premiums during the month of July, 1918; (3) the premiums on November 15, 1918; and (4) the premiums or discounts of each currency as of November 1, 1919:

Table showing highest premiums reached by certain foreign currencies in New York between April, 1917, and July 31, 1918; premiums on Nov. 15, 1918, and premiums or discounts as of Nov. 1, 1919.

¹ Premium.

NOTE.—Quotations for Chile are for inconvertible paper currency and premiums are calculated upon the average value of 18.8 cents per paper peso during the first 6 months of 1914 as a base. There is, therefore, no premium or discount properly so-called.

It will be observed that of these currencies the only ones now ruling at a premium are those of Japan, Bolivia, and India. In the case of Japan and Bolivia the premium roughly measures the cost, including loss of interest, of the export of gold from the United States to those countries, and may, therefore, be regarded as a normal quotation. With a free gold market in the United States, as we now have it, the currency of no gold-standard country should rise above such moderate premium as measures the cost of transportation of gold from this country to the country in question. That is the normal maximum. The normal minimum with any gold-standard country enjoying a free gold market would be a discount equal to the transportation cost from that country to the United States.

As the above table indicates, exchange on India is selling at a very considerable premium. The situation is anomalous. The currency of India at the present time, while nominally on a gold basis, is practically on a silver basis. This is due to the fact that the circulating medium of India is the silver rupee, designed to be and formerly actually a token coin, the present market value of whose silver content, however, is far above its rated gold value as Indian currency.

That rated value is 32.44 cents per rupee, and when silver is selling at 94.37 cents per ounce of fine silver the rated value of the rupee at par, viz, 32.44 cents per rupee, is equal to the market value of its silver content. The present quotation of the Indian rupee roughly measures the present market value of the silver content of the rupee. Owing to the propensity of the natives to hoard the precious metals, the Indian Government is unwilling to permit the importation into India of unlimited amounts of gold, which would thus to all intents and purposes be lost to the world, but very considerable amounts of gold have been sent to India and placed by the Government in the reserve against rupee currency notes. The exchange rate on India, therefore, in the present circumstances, is disconnected from the value of gold and responds roughly to the value of silver in the same manner as rates of exchange on China and Hongkong. A British commission was appointed early in 1919 to investigate the entire subject of the Indian currency.

CURRENCY AND CREDIT EXPANSION.

The progressive rise in commodity prices and wages has led to considerable public discussion as to whether there existed an inflation of the currency, and whether such inflation, if it existed, was a cause contributing to high prices. The discussion led to the introduction in the Congress of a resolution requesting an inquiry into the advisability of legislation providing for the gradual reduction of the currency in circulation. The chairman of the Senate Committee on Banking and Currency requested the views of the Federal Reserve Board on the subject, and I fully concur in the answer of the board, as embodied in Gov. Harding's letter to Senator McLean, under date of August 8, 1919.

There is no escape from the conclusion that under our system currency can be issued only in response to a demand therefor as circulating medium and that such currency is automatically retired when it is no longer required as circulating medium. Currency expansion, therefore, is an effect and not a cause of advancing prices. The remedy for high prices, as stated in Gov. Harding's letter, is "to work and to save; to work regularly and efficiently in order to produce and distribute the largest possible volume of commodities; and to exercise reasonable economies in order that money, goods, and services may be devoted primarily to the liquidation of debt and to the satisfaction of the demand for necessities, rather than to indulgence in extravagances or the gratification of a desire for luxuries."

Credit expansion must be carefully distinguished from currency expansion. The primary cause of high prices was the demand for commodities by the European belligerents before our entry into the war and by the United States and the European belligerents com-

bined after our entry into the war. So far as the United States Government was concerned, payment by the Government for war commodities rendered inevitable a certain measure of credit expansion, as it was impossible to bring about at once a restriction of private consumption by our people commensurate with the growing needs of the Government. This credit expansion, therefore, was the effect of the war demand for commodities by the United States Government and a necessary concomitant of that demand. The primary cause of high prices was war demand for commodities; credit expansion was a necessary concomitant thereof, and currency expansion an effect of the rise of prices.

ECONOMY.

Accepting a warning from the innumerable requests that are constantly being pressed upon the Congress for grants from the general fund, it becomes the clear duty of this department to point out that there appears to be grave danger that the extraordinary success of the Treasury in financing the stupendous war expenditures may lead to a riot of public expenditure after the war, the consequences of which could only be disastrous. It can not be too often repeated or too strongly urged that the optimistic outlook of the future of the Government's finances, as presented in the beginning of this report, is based upon the practice of the most rigid economy and the continuance of ample revenues from taxation. Any other policy means a calamitous upsetting of the entire program.

Government expenditure is, I need scarcely say, the most vital, fundamental factor in increasing the cost of living. Its evil effect in that respect is mitigated, but can not be wholly eliminated, by the wisdom and practical success of the financial measures adopted by the Government to meet its expenditures. Roughly speaking, the worst of these methods (which has been adopted in greater or less degree in the countries of Europe and not at all in the United States) is currency inflation. Far less harmful as a means of financing Government expenditures is the issue of bonds, notes, and other obligations of the Government, which, to the extent that they find lodgment in the hands of investors who pay for them from savings, are a means of meeting expenditures without expansion. The least harmful of all means of meeting Government expenditures is taxation, because this enforces a considerable measure of saving on the part of the taxpayer, who is not, as in the case of loans, furnished with a new basis of credit in exchange for the buying power he transfers to the Government. Of taxes the least harmful is the personal-income tax, graduated in accordance with the means of the taxpayer, since this is a direct tax and is only with great difficulty and to a limited extent shifted to the consumer. Indirect taxes, such as protective tariffs,

consumption taxes, and the excess-profits tax, though less harmful than currency inflation or loans, and having a less direct effect in increasing the cost of living, nevertheless have an appreciable influence in that direction.

Inevitably, then, Government expenditure increases the cost of living. The function of the Treasury, once the expenditure has been determined upon, is to devise means of meeting it with the least injurious results. What increases the general cost of living imposes an indirect tax on the whole people of the United States which, in the nature of things, bears more heavily upon the poor than upon the rich, and upon the needy than upon the poor, because expenditures for the necessities of life absorb practically the whole income of the poor and needy and a negligible portion of the income of the rich.

Measures for governmental expenditures for the benefit of a portion of the community at the expense of the whole by adding to the cost of living, and to the burden it imposes upon the community as a whole, will only aggravate evils which the sentimental supporters of those measures think to mitigate, and the burdens thus imposed invariably fall most heavily upon those least able to bear them.

I have ventured thus to recall to mind the general principles of economics and finance which underlie the present situation and which so frequently are ignored by the advocates of specific policies and measures that are subversive of sound principles. I discussed the matter somewhat in detail before the House Select Committee on the Budget on October 4, and my statement to that committee is quoted elsewhere in this report under the heading "A Budget System."

It is earnestly urged that the Congress deny every proposal for expenditures in new fields or the continuance or expansion of old unless they represent imperative and unquestioned need. This policy is particularly important in this period, when the solution of the problem of the cost of living is to be found in such large measure in the most rigid economy in public expenditure and in the firm determination to meet that expenditure from current taxes.

TAXATION.

Though any appreciable reduction in the amount of the revenues from taxation is not to be thought of during a fiscal year when the Government's current disbursements will exceed its current receipts, when its unfunded debt amounts to upward of \$3,736,000,000 (October 31, 1919, on the basis of daily Treasury statements), and when the Congress is considering various measures carrying vast additional appropriations, it is, I believe, the duty of the Congress to give its closest attention to the study of the incidence of taxation with a view to the revision of the revenue act on lines which will produce the necessary revenue with the minimum of inconvenience and injustice. The Treasury's objections to the excess-profits tax

even as a war expedient (in contradistinction to a war-profits tax) have been repeatedly voiced before the committees of the Congress. Still more objectionable is the operation of the excess-profits tax in peace times. It encourages wasteful expenditure, puts a premium on overcapitalization and a penalty on brains, energy, and enterprise, discourages new ventures, and confirms old ventures in their monopolies. In many instances it acts as a consumption tax, is added to the cost of production upon which profits are figured in determining prices, and has been, and will, so long as it is maintained upon the statute books, continue to be, a material factor in the increased cost of living.

The revenue sacrificed by elimination or reduction of this tax must be sought in an increase of the normal income tax (from which the income on Liberty bonds is exempt) and of the lower brackets of the surtax. The upmost brackets of the surtax have already passed the point of productivity, and the only consequence of any further increase would be to drive possessors of these great incomes more and more to place their wealth in the billions of dollars of wholly exempt securities heretofore issued and still being issued by States and municipalities, as well as those heretofore issued by the United States. This process not only destroys a source of revenue to the Federal Government, but tends to withdraw the capital of very rich men from the development of new enterprises and place it at the disposal of State and municipal governments upon terms so easy to them (the cost of exemptions from taxation falling more heavily upon the Federal Government) as to stimulate wasteful and nonproductive expenditure by State and municipal governments.

In that connection I call attention to the urgent necessity of revision of the revenue law so as to require that, for the purpose of ascertaining the amount of surtax payable by a taxpayer, his income from State and municipal bonds shall be reported and included in his total income, and the portion of his income which is subject to taxation taxed at the rates specified in the act in respect to a total income of such amount. The Treasury's recommendations in this respect have been transmitted to the appropriate committees of Congress in connection with the Revenue Act of 1918, and again in the present calendar year. Under the present law a person having an income of, say, \$1,000,000 from taxable securities would, upon the sale of half his property and the investment of the proceeds of that half in State or municipal bonds, not only obtain exemption for the income derived from such investment in State and municipal bonds, but greatly reduce the surtaxes payable in respect to his other income. It is intolerable that taxpayers should be allowed, by purchase of exempt securities, not only to obtain exemption with respect to the income derived therefrom, but to reduce the supertaxes upon

their other income, and to have the supertaxes upon their other income determined upon the assumption, contrary to fact, that they are not in possession of income derived from State and municipal bonds.

It is impossible to determine the actual gain in revenue to the Government which would result from such an amendment of the law. That it would be very material I have no doubt. A still more important result of the amendment of the law in this respect, however, would be the reflex benefit to Liberty bonds which carry exemption from normal income tax, but as to the great bulk not from surtaxes. The very great advantage the States and municipalities now have in conferring upon holders of their bonds larger exemptions from Federal taxation than the Federal Government itself confers upon holders of Liberty bonds should be reduced, so far as it may be reduced, by the adoption of appropriate administrative provisions in the Federal revenue law.

A question has been raised concerning the right of the Federal Government under the Constitution to tax the income from State and municipal bonds, but there can be no doubt of the constitutionality of such an administrative provision. The proposal is not to tax the income derived from State and municipal securities, but to prevent evasion of the tax in respect to other income. The principles involved are abundantly established in the decisions of the Supreme Court sustaining taxes upon corporations, bank stock, etc., computed after taking into account income derived from Government, State, and municipal bonds.

I am calling attention to these matters because it is of the utmost importance that the Congress should follow the wise precedent adopted by the last Congress in determining in advance of the year's business the basis upon which taxes are to be imposed. Uncertainty in respect to taxation during any given business period results in each taxpayer's setting aside for taxes an ample margin to cover variations in the tax law which may affect him onerously and calculating his costs and prices on that basis. Even a bad law is better than a retroactive law. It is, therefore, of the utmost importance, in my judgment, that the Congress should give consideration in the calendar year 1920 to the question of revision of the tax law with a view to making such revision effective well in advance in respect to the incomes and profits of the calendar year 1921.

The administration of the Revenue Act of 1918 is discussed later under the heading "Bureau of Internal Revenue."

THE COST OF THE WAR.

The total expenditures of the Government, exclusive of the principal of the public debt and postal disbursements from postal revenues, for the war period from April 6, 1917, to October 31, 1919,

amounted to \$35,413,000,000, according to statistics compiled on the basis of the daily Treasury statements. Of that great total covering the disbursements for two years and seven months, \$11,280,000,000, or nearly 32 per cent, was met out of tax receipts and other revenues than borrowed money, although the amount of taxes does not include the December 15, 1919, installment of income and profits taxes for the fiscal year 1919, nor any part of such taxes for the fiscal year 1920.

The above calculation includes capital outlays as well as expenditures that have been permanently absorbed. No deduction is made for loans to the Allies, or for other investments, such as ships, stock of the War Finance Corporation, bonds of the Federal land banks, etc. Foreign loans on October 31, 1919, aggregated \$9,406,000,000, and if that amount is deducted from the total expenditures, the disbursements for the purposes of the American Government during the war period under consideration were \$26,007,000,000. And on that basis, the proportion met out of tax receipts and revenues other than borrowed money was over 43 per cent.

If it is assumed that the expenses of the Government on a peace basis would have been at the rate of \$1,000,000,000 a year, or \$2,583,000,000 for the two years and seven months mentioned, the estimate of the gross cost of the war to October 31, 1919, would be \$32,830,000,000, inclusive of loans to foreign Governments, or \$23,424,000,000 exclusive of such loans.

The following tables, based on the daily Treasury statements, show the classified disbursements and receipts, exclusive of the principal of the public debt, by months, from April 6, 1917, to October 31, 1919, and the total disbursements and receipts for that period:

Classified disbursements, exclusive of the principal of the public debt, by months, from Apr. 6, 1917, to Oct. 31, 1919, as published in the daily Treasury statements.

	Ordinary.	Foreign loans.	Other special.	Total.
Apr. 6 to 30, 1917.....	\$71,328,006.70	\$200,000,000.00	\$7,885,770.50	\$279,213,777.20
May, 1917.....	114,102,809.68	407,500,000.00	4,962,746.28	526,565,555.96
June, 1917 (revised).....	131,687,849.61	277,500,000.00	919,445.78	410,107,295.39

There is attached a table showing the cash expenditures of the Government for the fiscal years 1917, 1918, and 1919, as published in the daily Treasury statements and classified according to departments.

THE PUBLIC DEBT.

The gross public debt, on the basis of the daily Treasury statements, amounted to \$26,210,530,000 on October 31, 1919, without any deduction for loans to the Allies or other investments. Of this sum, only \$3,736,352,000 was in the form of Treasury certificates or floating debt. The total figures mentioned represented a gross debt increase since April 6, 1917, of \$24,928,561,000. Deducting the net increase in the general fund balance from the gross debt increase results in a net debt increase for the war period from April 6, 1917, to October 31, 1919, of \$24,132,846,000.

The following statement shows the debt classified by issues and the gross and net increase for the war period:

Public debt Oct. 31, 1919, on the basis of the daily Treasury statements.

Bonds:

Consols of 1930	\$599,724,050.00	
Loan of 1925.....	118,489,900.00	
Panama's of 1916-1936.....	48,954,180.00	
Panama's of 1918-1938.....	25,947,400.00	
Panama's of 1961.....	50,000,000.00	
Conversion bonds.....	28,894,500.00	
Postal savings bonds.....	11,453,100.00	
		\$883,463,130.00

There is attached hereto the financial statement of the United States Government as of June 30, 1919, which shows the state of the Treasury and of the public debt on that date.

THE FOURTH LIBERTY LOAN.

The annual report of the Secretary of the Treasury for the fiscal year 1918 reported the approximate final results with respect to subscriptions to the fourth Liberty loan. It was necessary subsequently to make several adjustments in the compilation. The figures, corrected to September 30, 1919, show that the total amount of subscriptions allotted was \$6,992,927,100. The amount of bonds issued and deliverable as a result of these subscriptions was \$6,964,524,650. This was the largest of the Liberty loans and was the greatest issue of bonds in history. It is estimated that the vast amount allotted was subscribed by 22,777,680 persons. Eighty-four per cent of that number subscribed in amounts of \$50 and \$100, while more than 99 per cent subscribed in amounts ranging from \$50 to \$10,000. The following table shows the subscriptions allotted, payments received, and original deliveries of coupon and registered bonds as of September 30, 1919:

The fourth Liberty loan—Statement of subscriptions allotted, payments received, and original delivery of coupon and registered bonds as of Sept. 30, 1919.

The statistical information with respect to results of the fourth Liberty loan, attached hereto, was compiled by the War Loan Organization and is based upon the subscriptions as originally reported. Since that time there have been various adjustments in the figures, particularly with respect to Army subscriptions, which, under the special plan, were subject to cancellation in certain circumstances. The final allotment and issue, corrected to September 30, 1919, is in accordance with the above table.

THE VICTORY LIBERTY LOAN.

Early in the calendar year 1919 it became clear that it would be necessary, as predicted in November, to issue another loan in the spring to fund the floating debt, which was rapidly accumulating as the result of mounting expenditures in the months immediately succeeding the signing of the armistice. The situation was one of very great and very grave difficulty with respect to the successful continuation of the Government's program of war finance. The country was passing through the period of readjustment from the most colossal organization for war in our history to the normal processes of peace. This transition naturally was to be accomplished through gradual stages and inevitably was to be marked by uncertainties and perplexities that affected the whole structure of industry,

business, and finance. In addition, the cessation of hostilities, with the knowledge that the terms of the armistice made it impossible for Germany to resume fighting, caused many people hastily to assume that the large financial requirements of the Government were at an end. There could be no greater error, or even calamity if the impression were not quickly eradicated. The patriotism of war had made memorable successes of four great Liberty loans, but all of the war bills had not been paid. The fifth loan, to be floated without the accompaniment of the enthusiasm and delirium of war and the presence of imminent danger in the face of a national enemy, was to test the quality of the patriotism of peace of the people of America.

In the face of these unfavorable conditions, the Treasury was told by men of steady judgment that we must approach the problem of the fifth loan in a distinctly cold-blooded mood; that things had assumed a different aspect; that our attitude of mind and heart was altered; that we must consider the matter strictly from an investment point of view and put the loan on a commercial basis. Some students of the situation believed it would be impossible again to appeal to the patriotism of the American people. The Treasury held no such view. Furthermore, it was impossible to float the loan strictly on a commercial basis. After floating billions of dollars of Liberty bonds, it was unthinkable to expect the assimilation, purely for investment purposes, of a loan of the proportions required. This department recognized that an appeal must be made to the patriotism of Americans, and its unflinching faith in the result of that appeal was never shaken. The honor of the Government was involved in the payment of the war bills; and the Government's honor is the people's honor. To have lost confidence in the loyalty of the fathers and mothers, brothers and sisters, and compatriots of the fine men who went to France to save the freedom of the world would have brought despair into the Treasury, and despair in the Treasury, of all places, would have meant the failure of the loan.

It was the desire of the department to postpone the offering of the issue, which it was decided to name the Victory Liberty loan in honor of the heroic achievements of our gallant Army and Navy and the successful conclusion of the war, until the latest possible date in order to give the country time to recover from the tremendous transactions involved in the fourth Liberty loan, to permit the progress of readjustment to the utmost limit, and to afford the largest measure of preparation for the issue to be floated under such unusual and untried conditions. In the circumstances, it was out of the question to determine in detail all the terms and conditions of the loan before the third session of the Sixty-fifth Congress expired by constitutional limitation on March 4, 1919, and, consequently,

it was necessary to ask the Congress for larger discretion than had hitherto been granted, if the Government was to obtain all the advantages accruing from the ability to fix the rate of interest and other terms of the loan at an opportune and appropriate time in order to meet conditions as they might exist when the offering was made to the public.

While the Congress did not grant in full the authority requested by the Treasury, it responded, through the Victory Liberty loan act, approved March 3, 1919, with a law that entrusted sufficient power and discretion to the Secretary of the Treasury with respect to the fifth loan to enable him to deal with the situation as it might develop. The new statute authorized the issue of notes of the United States to the extent of not over \$7,000,000,000 upon such terms and conditions and at such rate or rates of interest as the Secretary might prescribe. It was provided that the maturities should be not less than one year nor more than five years from the date of issue. The act included certain alternative proposals with respect to exemptions from taxation and the Secretary was given discretion to choose from among four classes of exemptions. The right to fix the rate of interest and the latitude given with regard to exemptions from taxation permitted the Treasury to wait until the very eve of the loan campaign, if necessary, before naming the terms and conditions of the issue. For the purpose of stabilizing the market for the 4 per cent and 4½ per cent Liberty bonds, the law provided additional exemptions from taxation for the outstanding issues.

During the war, Secretary McAdoo had very wisely issued long-term bonds with maturities and redemption dates spread over the period from 1927 to 1947, leaving the field for short-term securities free, with the exception of war-savings certificates and the temporary certificates of indebtedness, for use in meeting the situation that followed the period of active fighting. After a careful survey of financial conditions in all parts of the country, it was decided to take advantage of the favorable field for short-term securities and exercise the authority conferred by the Victory Liberty loan act for the issue of short-term notes rather than long-term bonds, which latter, under the law, were limited as to rate of interest to 4½ per cent per annum and were subject, with an unimportant exception, to super-taxes and profits taxes. As soon as this conclusion was definitely reached the people of the country were promptly advised. The first public announcement was made on March 12, 1919, when it was stated that the notes would be sold as a popular issue by means of another great intensive campaign which would open on Monday, April 21, and close on Saturday, May 10. It was not possible, that far in advance of the opening of the campaign, to determine the rate of

interest or the exemptions from taxation which the notes would enjoy because those questions must be based on conditions existing immediately prior to the public offering.

During the weeks immediately preceding the campaign there still remained a small minority among the people, including men of influence in public life, who looked pessimistically upon the outlook for the success of the loan. Senator Calder aptly expressed this feeling in a letter which he wrote to the Secretary on March 27, 1919, drawing the department's attention to the decline in the market prices of Liberty bonds and urging the calling of an extra session of the Congress to pass remedial legislation to prevent the failure of the Victory loan. The Treasury did not in any sense share such gloomy forebodings.

The above exposition of the situation was heartily indorsed by the members of the War Loan Organization, whose views coincided with those of the Treasury and were guided by an abiding faith in the patriotism of the American people and their willingness and ability to do whatever was necessary in the circumstances to pay the bills of the war.

With all plans completed for the campaign, it was found possible to decide the terms and conditions of the loan on April 14, 1919, when the information was immediately given to the country. The formal offering of the issue was made in Department Circular No. 138, dated April 21, 1919, attached hereto. The form of application for the notes by subscribers generally, and the form of application by incorporated banks or trust companies for coupon notes for advance delivery, are attached hereto. The public announcement of April 14, summarizing the terms and conditions of the loan, was as follows:

The Victory Liberty loan, which will be offered for popular subscription on April 21, will take the form of $4\frac{1}{4}$ per cent three-four year convertible gold notes of the United States, exempt from State and local taxes, except estate and inheritance taxes, and from normal Federal income taxes. The notes will be convertible, at the option of the holder, throughout their life into $3\frac{1}{4}$ per cent three-four year convertible gold notes of the United States, exempt from all Federal, State, and local taxes, except estate and inheritance taxes. In like manner the $3\frac{1}{4}$ per cent notes will be convertible into the $4\frac{1}{4}$ per cent notes.

The amount of the issue will be \$4,500,000,000, which, with the deferred installments of income and profits taxes payable, in respect to last year's income and profits, during the period covered by the maturity dates of Treasury certificates of indebtedness now outstanding, will fully provide for the retirement of such certificates. The issue will be limited to \$4,500,000,000 except as it may be necessary to increase or decrease the amount to facilitate allotment. Oversubscriptions will be rejected and allotments made on a graduated scale similar in its general plan to that adopted in connection with the first Liberty loan. Allotment will be made in full on subscriptions up to and including \$10,000.

The notes of both series will be dated and bear interest from May 20, 1919, and will mature on May 20, 1923. Interest will be payable on December 15, 1919, and there-

after semiannually on June 15 and December 15, and at maturity. All or any of the notes may be redeemed before maturity at the option of the United States on June 15 or December 15, 1922, at par and accrued interest.

In fixing the terms of the issue, the Treasury has been guided largely by the desire to devise a security which will not only prove attractive to the people of the country in the first instance, but the terms of which should insure a good market for the notes after the campaign is over and identical prices for the two series, and should not affect injuriously the market for the existing bonds of the Liberty loans.

This will be the last Liberty loan. Although as the remaining war bills are presented further borrowing must be done, I anticipate that the requirements of the Government, in excess of the amount of taxes and other income can, in view of the decreasing scale of expenditure, be readily financed by the issue of Treasury certificates from time to time as heretofore, which may be ultimately refunded by the issue of notes or bonds without the aid of another great popular campaign such as has characterized the Liberty loans.

I am sure that the people of America will subscribe to this Victory loan in the same spirit of patriotism which they have shown in the past to the end that the notes may be as widely distributed as possible, and that our banking institutions may be left free to supply the credit necessary for the purpose of industry and commerce and the full employment of labor. Let the world see that the patriots of America, out of their boundless resources, and with the same enthusiasm and devotion to country with which they prosecuted the war to a victorious conclusion, are determined to finish the job.

Probably as a result of the certificate program, the country had acquired the impression that the loan would amount to \$5,000,000,000 or \$6,000,000,000, and the announcement that \$4,500,000,000 would be sufficient for the issue had a beneficial effect. In fixing the amount of the loan, the Treasury exercised its best judgment as to the sum which, having regard to the huge tax receipts which were being collected during the year, and the huge amounts of Liberty bonds so recently issued, it believed could be well absorbed. It was decided to reject any oversubscription of the issue, because the offering of an unlimited amount of the notes undoubtedly would have decreased any buying power, or eliminated the possibility of any buying power, after the loan was over and in effect would have curtailed the subscriptions. After the first loan and during the time of hostilities, with an unknown war period before us and unknown liabilities growing out of the war afterwards, the Treasury was bound to take all or substantially all the subscriptions it could get. Unquestionably that was a wise course during the period of the war. Now that hostilities were over and we knew approximately the dimensions of the Government's problem, it was believed that the closed issue would better serve the purpose.

One of the principal difficulties that confronted the department at the opening of the campaign and in the months immediately preceding was a certain apathy among the people owing to a lack of understanding of the financial needs of the Government. It was necessary for the Treasury and the Liberty loan committees to undertake an extensive campaign to inform the public that while the guns had ceased to fire, the war bills were still being received and many

obligations of the Government yet remained to be satisfied. The Secretary made a tour of the country for the purpose of arousing the interest of the people and advising them of the requirements of the Treasury. He visited and made public speeches in the following cities: Pittsburgh, Pa.; Minneapolis, Minn.; St. Paul, Minn.; Chicago, Ill.; Baltimore, Md.; Richmond, Va.; Norfolk, Va.; New York City; Cleveland, Ohio; Cincinnati, Ohio; Louisville, Ky.; Indianapolis, Ind.; Omaha, Nebr.; Denver, Colo.; Hutchinson, Kans.; Oklahoma City, Okla.; St. Louis, Mo.; Atlanta, Ga.; Charleston, S. C.; Philadelphia, Pa.; Boston, Mass.; and Providence, R. I.

The campaign for the loan found its expression and echo in every city, town, hamlet, and rural district of the country. The Treasury felt that all that was needed to assure the subscription of the notes was to reach the people with full and reliable information as to the Government's necessities. That faith was fully sustained by the result.

Like all previous issues, the loan was a great success, amply rewarding all the preparation and all the laborious work of the War Loan Organization and justifying the confident expectation of the Government and its steady trust in the loyalty of Americans and their capacity to accomplish the seemingly impossible. The patriotism of peace proved to be as great and as self-sacrificing as the patriotism of war. The Victory loan was more than a victory; it was a thanksgiving. The result was a significant achievement in the face of dire predictions and was a further manifestation of the solidarity of the people and their love of the United States.

The total subscriptions, which were widely distributed among the people, amounted to \$5,249,908,300—an oversubscription of \$749,908,300, or 16.66 per cent. In accordance with the terms of the issue the oversubscription was rejected, and subscriptions allotted to the amount of \$4,500,000,000, which has been since slightly reduced as the result of adjustments and cancellations of Army and Navy subscriptions. The amount of subscriptions allotted, corrected to September 30, 1919, was \$4,498,312,650.

Allotment of subscriptions was made on the following basis:

Class of subscriptions.	Per cent allotted.
A and B, up to and including \$50,000.....	100 per cent.
C and D, over \$50,000 and up to and including \$200,000.....	80 per cent but not less than \$50,000 notes.
E, as follows:	
Over \$200,000 and up to and including \$500,000.....	70 per cent but not less than \$160,000 notes.
Over \$500,000 and up to and including \$2,500,000.....	60 per cent but not less than \$350,000 notes.
Over \$2,500,000 and up to and including \$15,000,000.....	50 per cent but not less than \$1,500,000 notes.
Over \$15,000,000 and up to but not including \$30,000,000.....	45 per cent but not less than \$7,500,000 notes.
\$30,000,000 and up to but not including \$50,000,000.....	42.4 per cent.
\$50,000,000.....	42.39 plus per cent—(\$21,196,600 notes).

In order to facilitate the gradual payment for subscriptions and accommodate the convenience of investors in the notes as far as possible, subscribers were permitted to make payment on the following installment plan, stretching over the six months' period from May 10, 1919, to November 11, 1919:

10 per cent with application on or before May 10.

10 per cent on July 15.

20 per cent on August 12.

20 per cent on September 9.

20 per cent on October 7.

20 per cent on November 11, with accrued interest on deferred installments.

Payment in full could be made with application or on May 20 (except as to subscriptions subject to allotment, in which case payment might be completed on June 3) provided the 10 per cent required with application had been duly paid on or before May 10. It was also permissible to complete payment on any installment date with accrued interest.

The subjoined table shows the subscriptions allotted, payments received, and original deliveries of registered and coupon notes as of September 30, 1919:

¹ Includes adjustment Oct. 1, 1919.

NOTE.—Payments as shown by Treasurer United States. Full-paid subscriptions and coupon notes delivered as shown by monthly statement of Federal reserve banks. Registered notes delivered as shown by records of Secretary's office, Division of Loans and Currency.

There are attached hereto various tables showing the results of the Victory loan. These were compiled by the War Loan Organization and are based upon the subscriptions as originally reported. Since that time there have been various adjustments in the figures, particularly in connection with Army and Navy subscriptions, which under the special plan, were subject to cancellation in certain cir-

cumstances. The final allotment and deliveries upon original issue, corrected to September 30, 1919, are in accordance with the above table.

TREASURY CERTIFICATES OF INDEBTEDNESS.

Every issue of Treasury certificates of indebtedness from the beginning of the war to date has been a success. This means of temporary financing has provided the Government with funds in advance of receipts from the sales of bonds or notes or in anticipation of revenue from income and profits taxes, and has served the additional helpful purpose of distributing the payments of bond and note subscriptions and of taxes gradually over extended periods of time, avoiding tremendous transfers of funds on any one date and consequent money stringency.

The execution of the certificate and Liberty loan program was made possible by the creation of a great system of depository banks, referred to more in detail elsewhere in this report under the heading "Public Moneys and Special Depositories." Bank deposits in America are distributed among some 36,000 banks and trust companies scattered throughout the country. By the designation of nearly 10,000 banks and trust companies as special depositories of the Government and the sale to them and to many others of certificates of indebtedness, the Treasury tapped the whole credit resources of the people and made them available to the Government for the winning of the war in the intervals between the great Liberty loans and in anticipation of income and profits taxes. Through the development of this plan, banks and trust companies are having increasing success in the distribution of the securities to their customers.

The issues of certificates have fallen into three general classes, (1) those issued in anticipation of loans, (2) those issued in anticipation of income and profits taxes, and (3) special issues. The special issues may be subdivided into three groups, (a) those issued under the Pittman Act, (b) issues payable in foreign currency and discussed elsewhere in this report under the heading "Loans to Foreign Governments," and (c) special issues of very short maturity for temporary purposes.

The aggregate amount of all issues since the beginning of the war to October 31, 1919, was \$32,706,964,903.34. Of that sum \$18,657,988,000 was placed with the public in anticipation of sales of bonds and notes, \$6,060,866,000 in anticipation of tax payments, and \$7,988,110,903.34 comprised the special issues. The amount outstanding on October 31, 1919, aggregated \$3,736,352,300.37, consisting, as shown by the following table, of \$1,827,586,500 tax certificates, \$1,634,671,000 loan certificates, \$255,475,000 issues under the Pittman Act, \$15,741,300.37 other special issues, and \$2,878,500 matured certificates on which interest has ceased:

Statement of Treasury certificates outstanding Oct. 31, 1919.

Tax certificates:

Series T-5 dated June 3, 1919, due Dec. 15, 1919	\$236,760,500.00
Series T-7 dated July 1, 1919, due Dec. 15, 1919.....	510,109,000.00
Total tax certificates due Dec. 15, 1919.....	746,869,500.00
Series T-8 dated July 15, 1919, due Mar. 15, 1920.....	322,116,500.00
Series T-9 dated Sept. 15, 1919, due Mar. 15, 1920.....	101,131,500.00
Total tax certificates due Mar. 15, 1920.....	423,248,000.00
Series T-10 dated Sept. 15, 1919, due Sept. 15, 1920.....	657,469,000.00

Loan certificates:

Series A-1920 dated Aug. 1, 1919, due Jan. 2, 1920.....	\$532,024,500.00
Series B-1920 dated Aug. 15, 1919, due Jan. 15, 1920.....	530,329,000.00
Series C-1920 dated Sept. 2, 1919, due Feb. 2, 1920.....	572,317,500.00
Total loan certificates series 1920.....	1,634,671,000.00

RECAPITULATION.

Tax certificates due Dec. 15, 1919.....	\$746,869,500.00
Tax certificates due Mar. 15, 1920.....	423,248,000.00
Tax certificates due Sept. 15, 1920.....	657,469,000.00
Total tax certificates.....	1,827,586,500.00
Loan certificates due Jan. 2, Jan. 15, and Feb. 2, 1920.....	1,634,671,000.00
Total tax and loan certificates.....	3,462,257,500.00
Pittman Act certificates.....	255,475,000.00
Other special certificates.....	15,741,300.37
Matured certificates on which interest has ceased.....	2,878,500.00
Total outstanding Oct. 31, 1919.....	3,736,352,300.37

The certificate program subsequent to the Victory Liberty loan is discussed in the beginning of this report. In anticipation of that loan there were 10 issues of certificates offered in the main at fortnightly intervals over the period from December 5, 1918, to May 1, 1919.

The maturity of each issue in anticipation of the Victory loan was five months (except series V K, where the maturity exceeded five months by only one week) and the rate of interest was 4½ per cent. The aggregate amount issued was \$6,157,589,500, which has all been retired from Victory note subscriptions, cash in bank, or refunding operations. Some of the issues were called for redemption in advance of maturity and in other cases, when possible, offers were made to redeem the certificates in advance of maturity at the option of the holders. To the extent that such calls were made or such offers accepted, the retirement of the certificates was facilitated, and the expense of interest charges to the Government was saved. This policy has been consistently pursued whenever the position of the Treasury would permit.

Including two issues mentioned in the previous annual report of the Secretary of the Treasury, there were eight issues of certificates,

aggregating \$3,354,787,500, in anticipation of income and profits taxes payable in the calendar year 1919. There have been three issues, aggregating \$1,081,675,000, in anticipation of income and profits taxes payable in the calendar year 1920. The first issue on August 20, 1918, in anticipation of 1919 taxes, bore interest at the rate of 4 per cent. All succeeding issues were at the rate of $4\frac{1}{2}$ per cent until September 15, 1919, when the rate for the series maturing in six months, series T 9, was reduced to $4\frac{1}{4}$ per cent. The maturities of all the outstanding issues of tax certificates coincide with the dates for the payments of income and profits taxes. The outstanding issues mature on December 15, 1919, March 15, 1920, and September 15, 1920. December 15, 1919, is the date for the payment of the fourth installment of income and profits taxes for the year 1919. March 15 and September 15, 1920, are the first and third installment dates for the payment of income and profits taxes for the year 1920.

In offering tax certificates to the public, every possible effort has been made to advise taxpayers of their availability. About the middle of January, 1919, in advance of the passage of the revenue act approved February 24, 1919, and when it was uncertain what installment dates for the payment of income and profits taxes would ultimately be carried in the new law, the Treasury offered an issue of certificates with sufficient elasticity as to the date when they would be receivable in payment of such taxes to cover any possible changes in the bill as it was then pending in the Congress.

Wide publicity has been given to all offers of tax certificates from time to time, in order that taxpayers might patriotically assist the financial operations of the Government and at the same time serve their own convenience by saving in anticipation of their taxes by means of a wise investment, assuring a liberal return. Similar efforts to obtain the largest possible distribution among investors of loan certificates have been made in respect to all the issues subsequent to the Victory loan. The success of these efforts for the distribution of loan and tax certificates appears from the fact that of \$3,465,136,000 of loan and tax certificates outstanding on October 31 the Federal Reserve Board's reports show that the holdings of all reporting member banks as of November 7, 1919, amounted to only \$847,558,000. From the fact that on the average 80.5 per cent of the subscriptions for certificates are made by qualified depositaries and that on the average 79 per cent of the Government deposits during the period of the offerings were held by the banks included in these reports to the Federal Reserve Board, the Treasury estimates that 63.5 per cent of the certificates outstanding, or \$2,200,361,360, were originally subscribed for by all reporting member banks, and that therefore they have distributed among investors about 62 per cent of the certificates originally subscribed for by them.

A table showing in detail all the issues of certificates of indebtedness, from the beginning of the war to October 31, 1919, is attached hereto as Exhibit 12, page 258. Public announcements of the various offerings of certificates of indebtedness in anticipation of loans and taxes, together with calls for redemption before maturity, and offers to redeem at the option of the holders, which have been issued since the previous annual report of the Secretary of the Treasury, are likewise attached as Exhibits 13 to 41, pages 266 to 290.

WAR-SAVINGS CERTIFICATES.

Sales of war-savings stamps and certificates and thrift stamps have proceeded throughout the year, and the Treasury plans the continuation of this wholesome movement with unabated vigor in the interest of savings and investment in Government securities. The campaign was conducted in the calendar year 1919 under an organization remodeled according to the plan evolved in the latter part of 1918 and described in the previous report of the Secretary of the Treasury. The work in the field has been in charge of organizations for each of the several Federal reserve districts under the direction and supervision of the governors of the respective Federal reserve banks. Each governor appointed a district director. In some districts a "director of war-loan organization" was appointed in charge of all war-loan activities, including those relating to the war-savings securities, but in other districts a separate "director of savings" was designated. At the beginning of the calendar year 1919, a savings division was created in the Treasury in charge of a director of savings. This division is part of the Treasury's War Loan Organization and is under the general supervision of the Treasury director of War Loan Organization. The governors of the Federal reserve banks are responsible for the conduct of the savings movement in their respective districts, and the work is carried on under plans adapted to the special needs of the particular districts, subject to general principles outlined by the Secretary of the Treasury. The Treasury savings division initiates or executes the work of a general or national character, coordinates the activities in the districts, and acts as a service bureau, furnishing the district organizations with suggestions and material for local use.

No change was made in 1919 in the thrift stamps used in 1918, the stamps being undated and non-interest-bearing securities. The 1919 war savings stamps and certificates are identical in terms with the stamps and certificates of the 1918 issue, except for the fact that they mature on January 1, 1924, instead of January 1, 1923. The form, however, was changed. The 1919 stamps are smaller in size, blue in color, and bear the portrait head of Benjamin Franklin. The terms

of the issue appear in Department Circular No. 128, dated December 18, 1918, attached hereto.

In order to meet the demand for war-savings securities in single denominations larger than \$5, the Treasury, in July, 1919, announced the issue of war-savings certificates of two additional denominations, one of \$100 and the other of \$1,000, maturity value. These certificates, which for convenience were described as "Treasury savings certificates," are a part of the 1919 series of war-savings certificates and are subject to the provision of the authorizing act that it is not lawful for any one person at any one time to hold war-savings certificates of any one series (of whatever issue or denomination) to an aggregate amount exceeding \$1,000, maturity value. The Treasury savings certificates are war-savings certificates of larger denominations, and they have corresponding terms as to increasing sales and redemption values each month and the same period of maturity. The certificates are all registered, by means of detachable registration stubs, and the registration records are kept in the Treasury rather than in the post offices. It was also provided that the redemption should be made by the Treasury direct rather than through the post offices. Like other war-savings certificates, these certificates may be redeemed prior to maturity, but they differ in that they can not be redeemed before the second calendar month following the month in which they were purchased. Treasury Department Circulars Nos. 143 and 149, dated July 1, 1919, and July 31, 1919, respectively, attached hereto as Exhibits 43 and 44, pages 295 and 302, describe the new certificates in detail and prescribe the terms and conditions governing their issue and redemption and the rights of their holders. The sales of these certificates up to the present indicate that they meet a real demand.

The cash receipts from the sale of thrift and war savings stamps and Treasury savings certificates, using the figures in the daily Treasury statements for the last day of each month, from the first month of their issue to October 31, 1919, have been as follows:

1917—December.....	\$10,236,451.32
1918—January.....	24,559,722.15
February.....	41,148,244.22
March.....	53,967,864.49
April.....	60,972,984.12
May.....	57,956,640.12
June.....	58,250,485.00
July.....	211,417,942.61
August.....	129,044,200.62
September.....	97,614,581.48
October.....	89,084,097.31
November.....	73,689,846.00
December.....	63,970,813.47
	\$971,913,872.91

1919—January.....	\$70, 996, 041. 14	
February.....	15, 816, 539. 27	
March.....	10, 143, 081. 68	
April.....	9, 572, 728. 48	
May.....	6, 558, 198. 33	
June.....	5, 269, 535. 51	
July.....	5, 176, 865. 12	
August.....	6, 201, 164. 07	
September.....	6, 111, 944. 78	
October.....	7, 316, 467. 60	
		\$143, 162, 565. 98
Total.....	1, 115, 076, 438. 89	

While, naturally, with the termination of the popular campaigns of the war period, which made instant appeal to the patriotic impulse of that time, sales dropped sharply to a lower level, the upward trend appearing in the figures for the recent months indicates that the efforts of the savings organization to combat the present tendency to waste and extravagance which has come as a reaction to the war-time economies are now having their effect.

The redemptions for the same period have totaled \$204,391,451.45.

These redemptions were largely of the issues preceding 1919, and it is felt that they represent chiefly the release of securities purchased as a result of the war-time appeal by persons who were not prepared to hold them permanently as an investment.

The measure of the usefulness of the war-savings organization and of the savings movement is not to be found in the sales of war savings securities alone. The war-savings organization is charged with the duty of carrying on a movement for saving and investment in, and holding of, Government securities of all kinds—Liberty bonds, Victory notes, and Treasury certificates of indebtedness as well as war-savings securities. These activities of the savings organization are specifically contributory to the sale from time to time of Government securities of all kinds to finance the remainder of the war bills and the floating debt. The savings movement has two objects—first, to sell the war-savings securities; and, second, to develop and protect the secondary market for all war issues, to assure the permanence of the war-time achievement in selling Government securities to millions of investors among the American public, to increase the number of such investors, and to build up permanently habits of regular saving and investment in United States Government securities. The two objects focus to the same point, namely, promoting the steady purchase and holding of United States Government securities of all kinds. In addition to selling the war-savings securities, the organization carries on a work largely of an informational character designed to protect the value of the outstanding war loans and to prepare the market for new offerings. This involves a cam-

paign to defeat the efforts of traffickers who attempt to obtain the securities for less than the market prices or in exchange for worthless stocks or shares in fraudulent promotions, and also the dissemination of general information as to the value and desirability of Government securities. The most is made of every legitimate opportunity to impress the importance of saving and investment in Government securities upon the public through established publications and through special printed matter where it is believed that results can be obtained thereby. The present high cost of living has presented a real opportunity of service for the movement to enforce the realization that increased production, saving, and investment present the most direct and potent means of solving this pressing economic problem.

The organization has accomplished a very important work in organizing the savings movement in the schools of the country. It has been realized that the schools are a most important means of inculcating the saving habit and of building up for the future a body of people who have the habit of saving and the tendency to turn to Government securities for investment. The Department of the Interior, through its Bureau of Education, is rendering valuable cooperation. Important progress has been made in securing the cooperation of State superintendents of education and in obtaining the introduction of savings material in textbooks, and it is expected that next year the study of saving will be a part of the regular course in a very great number of public schools and other educational institutions throughout the country. The schoolrooms, to a large degree, have also been organized for the regular purchase of thrift and war-savings stamps.

Another very important work has been in establishing the movement in industrial and commercial organizations. A large number of associations, plants, and mercantile establishments have given the savings movement their indorsement and have organized savings societies for the regular purchase of the war-savings securities. The movement has also been indorsed and organized in women's clubs, fraternal organizations and labor bodies, and assistance has been received from the churches. Through the valuable cooperation of the Department of Agriculture, effective work has been done among agricultural organizations. The cooperation of the schools and the other organizations described not only has great present value, but it promises for the future a means to carry on the movement with a reduction of expense and of direct effort on the part of the Treasury and district savings organizations.

The sale of the war-savings securities will be continued in 1920, and the new series are now in course of preparation. Substantially the same thrift stamps and thrift cards now in use will be used

in 1920. The war-savings stamps and certificates and the Treasury savings certificates for 1920 will be substantially the same in terms and conditions, but some alterations will be made in the forms. The 1920 war-savings stamp will be carmine in color, will bear the head of George Washington, and the size will approximate the larger stamp used in 1918. The Treasury savings certificates, \$100 denomination, will be orange in color, and the \$1,000 denomination will be green.

The Treasury savings division was recently reorganized, and a similar reorganization is now in process in the districts, as a consequence of which it is hoped that they will render greater and more effective service in 1920, notwithstanding the fact that the expense of their operations will be materially less than in former years.

Detailed provisions for the surrender and exchange, by agents, of the war-savings stamps, series of 1918, and for the continuation, appointment and operations of agents for the year 1919 appear in Department Circulars Nos. 126, 130, and 131, the first dated December 10, 1918, and the latter two December 23, 1918, which are attached as Exhibits Nos. 45, 46, and 47, pages 308, 309 and 311.

LOANS TO FOREIGN GOVERNMENTS.

Under the acts of Congress of April 24, 1917, September 24, 1917, April 4, 1918, and July 9, 1918, the Secretary of the Treasury continued to establish credits in favor of foreign Governments engaged in war with enemies of the United States and to the extent of credits so established to make advances to such Governments through the purchase at par of their respective obligations. Since the last report credits were established in favor of Belgium, the Czecho-Slovak Republic, France, Great Britain, Greece, Italy, Roumania, and Serbia, and advances have been made to these countries and also to Cuba and Liberia under credits previously established. No credits were established in favor of Russia during the year, nor were any advances made to that country, and the balance of credit which had previously been established above the amount of the cash actually advanced was withdrawn. In certain instances, in which the purpose was accomplished for which a credit had been established or an advance had been made without requiring the total amount of the credit or the advance, the balance of credit was withdrawn or the unused portion of the advance was repaid. Certain other repayments were made in connection with the routine of the accounts. None of the repayments constitutes part of a general program of repayment by any foreign Government. The total appropriation provided by Congress for loans to foreign Governments is \$10,000,000,000. From April 24, 1917, up to November 15, 1919,

the credits established, after deducting credits which had been withdrawn, and the cash advances were as follows:

	Credits established.	Cash advanced.	Other charges against credits.	Balances under established credits.
Belgium.....	\$343,445,000.00	¹ \$338,745,000.00		\$4,700,000.00
Cuba.....	10,000,000.00	10,000,000.00		
Czechoslovakia.....	55,330,000.00	52,690,000.00		2,640,000.00
France.....	3,047,974,777.24	² 2,887,177,800.00	\$110,000,000.00	50,496,977.24
Great Britain.....	4,277,000,000.00	³ 4,277,000,000.00		
Greece.....	48,236,629.05		48,236,629.05	
Italy.....	1,620,922,872.99	1,610,922,872.99		10,000,000.00
Liberia.....	5,000,000.00	26,000.00		4,974,000.00
Roumania.....	25,000,000.00	25,000,000.00		
Russia.....	187,729,750.00	187,729,750.00		
Serbia.....	26,780,465.56	26,780,465.56		
Total.....	9,647,419,494.84	9,416,371,888.55	158,236,629.05	72,810,977.24

¹ \$10,000 of this amount repaid by the Belgian Government.

² \$12,147,000 of this amount repaid by the French Government.

³ \$57,164,007.99 of this amount repaid by the British Government.

It is difficult to exaggerate the great purposes served and the great results accomplished by these advances to foreign Governments. In the most critical stages of the war they immeasurably assisted America's gallant associates in obtaining the munitions, supplies, and equipment that were so imperatively needed to meet the enemy's offensives or to carry the fighting into his territory, and probably of equal importance was the fact that they served to hearten the allied armies and peoples by the knowledge that the vast credit resources of the United States were being shared with them for the effective prosecution of a common cause. Conversely, it is not difficult to estimate the disheartening effect that these loans of billions and the willingness of America to lend for the prosecution of the war as much more as was needed to the limit of her ability must have had upon the spirit and morale of the peoples and armies of the enemy.

In the beginning, before the creation of our great Army, the principal assistance of America was necessarily through foreign loans, and it was then that these advances proved so very potent in contributing to the final victory. Loans to Russia in 1917 kept that great nation in the war and held the German troops upon the eastern front for six precious months. Similarly in each grave crisis, whether on the Italian front or on the battle fields of France or Belgium, the loans from the United States gave the Allies the means of replenishing supplies and equipment, and inspired their fighting forces and the peoples behind them with renewed hope and confidence and with strengthened determination in the face of an advancing foe. The service of these loans in assisting to hold the battle fronts of Europe until the might of our heroic Army could be felt effectively, made possible, beyond the shadow of a doubt, the ending of the war in the

fall of 1918. Without this aid to the allied Governments, the war unquestionably would have been prolonged, if not lost, with the resultant great additional cost in life and treasure.

Detailed statements showing the dates and amounts of credits and advances to foreign Governments are attached hereto as Exhibits 48 and 49, pages 312 and 316.

Currencies needed by the United States in France, Great Britain, and Italy for our war expenditures in those countries continued to be provided by the respective foreign Governments under an arrangement whereby the dollar equivalent of the amounts so provided was made available to the respective foreign Governments for use to meet their war expenditures in the United States, and thus the needs of these Governments for advances from the United States were reduced by a corresponding amount. This plan was also extended to Belgium. The following tabulation shows the amount of foreign currencies so placed at the disposal of the United States and the dollar equivalents paid therefor in the United States for the period commencing during the month of January, 1918, up to November 15, 1919:

Country.	Francs.	Pounds sterling.	Lire.	Dollar equivalent.
Belgium	2,500,000.00			366,300.37
France	5,709,031,418.08			1,110,138,235.98
Great Britain		87,768,387/13/1		401,393,060.05
Italy			97,583,742.51	14,425,092.25
Total				1,526,322,688.65

In June, 1918, the requirements of the American Expeditionary Forces for pesetas were indicated to the Treasury to be extremely heavy. At that time Spanish exchange was at a premium of about 40 per cent. In order to obviate the necessity of purchasing pesetas at so large a premium a representative of the Treasury went to Spain and in August, 1918, made arrangements whereby a syndicate of Spanish banks agreed to extend credits up to 250,000,000 pesetas to be availed of through the acceptance of bills drawn by American banks, members of the Federal Reserve System. In order to avail of this arrangement the Treasury sold certificates of indebtedness payable in pesetas. The total amount of credits availed of and of obligations so sold aggregated 155,000,000 pesetas. The bills were discounted on the basis of $4\frac{1}{2}$ per cent interest, which, together with the acceptance commission and certain other charges, made the total cost of the money at the rate of about $5\frac{1}{4}$ per cent per annum. Partly as a result of the credits so arranged the rate for Spanish exchange soon began to drop, and the Treasury has lately reduced by 80,000,000 pesetas the amount of its peseta obligations. So far as necessary this was done by the purchase of pesetas in the exchange market at par or less.

All interest which has become due on the obligations of foreign Governments held by the United States has been paid in cash with a relatively unimportant exception pending adjustment. To the extent that such interest has not been paid from other resources of the foreign Governments concerned it has been paid from the proceeds of loans made by the United States Government. With the termination of the war and the rapidly approaching exhaustion of the appropriation it was considered necessary and appropriate for the Secretary of the Treasury, as contemplated by the Liberty bond acts, to take up with the foreign Governments the funding of the demand obligations now held by the United States into long-time obligations and the funding during the reconstruction period, say for two or three years, of interest on the obligations. In view of the present derangement of the foreign exchanges it would add to the difficulties of the situation and would not be to the advantage of the United States to require cash payment of interest.

The authority given by first, second, third, and fourth Liberty bond acts to make loans to foreign Governments was for the purpose of national defense and the prosecution of the war. In order to assist in meeting needs growing out of the war, the Treasury recommended the enactment of legislation extending the authority within certain limits but without increasing the aggregate amount of the appropriation. By the Victory Liberty loan act approved March 3, 1919, the Secretary of the Treasury was authorized, within the \$10,000,000,000 previously appropriated, to make loans to foreign Governments then engaged in war with enemies of the United States for the purpose of providing for purchases of any property owned directly or indirectly by the United States not needed by the United States or of any wheat, the price of which has been or may be guaranteed by the United States. The Secretary of the Treasury is empowered to establish credits under this authority until the expiration of 18 months after the proclamation of peace. Thus far no credits have been established under this provision.

The Inter-Ally Purchasing Commission, constituted in August, 1917, through formal arrangements entered into by the Secretary of the Treasury with the approval of the President on behalf of the United States with representatives of the Governments of the Allies, was terminated on December 14, 1918, and such of its functions as it was desirable to continue were taken over by the Treasury. These functions came to an end when the foreign Governments ceased making new purchases to be paid for out of advances from the Treasury.

WAR LOAN ORGANIZATION.

The flotation of the Victory Liberty loan and the sales of certificates of indebtedness were conducted through the same form of organization which made such memorable successes of the previous offerings of war securities to the public. Under the general direction and guidance of the Treasury, the 12 Federal reserve banks, as fiscal agents of the United States, continued to serve as the centers of the War Loan Organization in their respective districts throughout which were organized Liberty loan committees composed of volunteers who operated in their respective localities in behalf of the Victory campaign.

During the months following the armistice and preceding the offering of the Victory loan, there developed a very natural desire on the part of the members of the War Loan Organization throughout the country, who had left their usual pursuits in life to serve the Government in the critical crisis of war, to return to their normal activities. These men and women were volunteers in the great cause of liberty; their families and businesses had been neglected and personal matters required their attention. It could not be expected that they would continue indefinitely in the volunteer service of the Government at the expense of every personal consideration and of their own livelihood. The patriotism and mettle of these workers were so well known to the Treasury that it was believed that an appeal for one more and final effort in a great popular campaign would receive a gratifying response.

On December 20, 1918, a few days after assuming the office of Secretary of the Treasury, I issued the following appeal for the continued support to the Treasury of the War Loan Organization.

The above statement was later followed by an announcement that the Victory loan would be the last Liberty loan; that is to say, the last war loan floated by means of a great popular campaign. It was anticipated that necessary future borrowings could be made in the form of certificates of indebtedness which, if need be, might be refunded by the issue of notes or bonds without the aid of another popular campaign, such as those of the Liberty loans.

That statement of policy saved the Liberty loan committees from disintegration, and saved the Victory loan from failure, because it could not have been floated as a popular issue without the services of these volunteer workers. As was to be expected from men and women of such proved sterling worth and exalted love of country, they answered the Treasury's call with definite assurances that a supreme effort would be made by every worker to make the loan a success that was comparable with the results of the issues sold during the period of actual warfare. These pledges were entirely ful-

filled and, with the disbandment of this great volunteer army of workers, the Treasury desires to make due acknowledgment of the value of their patriotic service and to express its sincere gratitude for the loyal and effective work which made the unprecedented results of the loans possible.

The Victory loan campaign conducted by the War Loan Organization pointed out the great investment value of the notes, and its keynote was an intensive call to the patriotism of the people to "finish the job" with the largest possible distribution of the securities. Banks, bankers, trust companies, business men, associations and societies, and thousands of men and women throughout the country patriotically cooperated with the Treasury and the War Loan Organization in making the last popular loan a splendid and unqualified success. Men and women in every part of the land patriotically and unselfishly devoted their best efforts through days of unflagging labor to the service of the Government, and richly earned the Nation's gratitude.

The organization for the sale of war savings securities is discussed elsewhere in this report under the heading "War savings certificates."

After the conclusion of the Victory loan, Lewis B. Franklin, of New York, who had served as director of the War Loan Organization from the beginning, resigned to return to private life, and was succeeded by John H. Mason, of Philadelphia, who had been a member of the Liberty loan organization of the Philadelphia Federal Reserve district, and who since the fall of 1918 had served as director of the organization in that district.

War loan publicity.

The publicity campaigns conducted by the War Loan Organization of the Treasury in the interest of the five war loans are without parallel in history. The campaign in behalf of the Victory issue was as intensive and widespread as those for the previous loans. It embraced every avenue of publicity and propaganda. All media of arousing the interest and inviting the attention of the people to the imperative needs of the Government and the great value of the Victory notes as a means of saving and investment were utilized. Machinery drafted for publicity purposes ranged from the seemingly insignificant subscriber's button to the mightiest engines of war from land and sea. The printed and spoken word of men prominent in all walks of life and the greatest art of the Nation were marshaled into service. The combined result was an agency that forcibly carried the message of the Treasury into every home in the country.

Newspapers, magazines, trade journals, and other publications gave unlimited space in their news and advertising columns to the

interest of the loan. Press associations carried columns of reading material. Millions of posters designed by leading artists, street-car advertising cards, and innumerable booklets were distributed. Five thousand widely known men and women spoke in behalf of the issue under direction of the Speakers' Bureau of the Treasury. More than 100,000 clergymen of all denominations delivered Liberty loan sermons, while Four-Minute Men to the number of several thousand spoke daily in theaters and at other places of assembly.

War exhibit trains traveled from city to city carrying American, allied, and captured German war matériel. Aerial demonstrations by celebrated aces were given in over 80 cities. Eighty-five thousand captured German helmets were presented to salesmen as prizes. Medals cast from German cannon were presented as rewards to workers. An honor flag was granted to cities that exceeded their quotas.

Theatrical managers and members of the profession cooperated heartily. Sales were made in theaters, and actors and actresses contributed of their time and talent to the success of the issue. Motion-picture theaters and stars of the profession gave their support unstintedly. Films were purchased at cost and many were contributed.

American soldiers, sailors, and marines from the camps and ships in America and from the army of Gen. Pershing and the fleet of Admiral Sims lent valiant aid to the campaign both as speakers and salesmen. Picked veterans from the armies of the nations associated with America in the war toured many cities of the country and captured German submarines were exhibited in important ports.

The above relates to the publicity which was conducted on a national scale. In addition, the publicity branch of the War Loan Organization in the Treasury supervised and coordinated the propaganda activities of the publicity committees in the several Federal reserve districts, which operated under the immediate direction of the Federal reserve banks. These committees conducted extensive campaigns of publicity that were of especial application locally or met the particular needs of the districts concerned. They heartily cooperated with the central organization in Washington and rendered service of very great magnitude and value.

Since the conclusion of the Victory loan, publicity has been continued in connection with the sale of certificates of indebtedness and thrift stamps and war savings stamps and certificates, and in promotion of the movement for saving and investment in Government securities.

NATIONAL WOMAN'S LIBERTY LOAN COMMITTEE.

The successful service of the national woman's Liberty loan committee and of its effective nation-wide organization of patriotic women

was brought to a notable climax in the Victory loan campaign. With the signing of the armistice and the natural tendency of all volunteers to feel that their services were no longer required, the disintegration of this organization seemed inevitable. In response to the appeal of the Treasury, however, the committee and each of its State chairmen assured the department that the organization would remain intact and efficient as long as its services were required in the loan operations of the Government. The entire organization redeemed that promise by the continuation of its splendid work during the Victory loan campaign.

The Treasury desires to record its deep appreciation of the effective service of the patriotic women who so loyally worked for the loans and cooperated with the department in each of the campaigns. The committee assisted in immeasurable degree in mobilizing the womanhood of the United States and in helping the mothers, wives, and sisters of the heroic sons of America who went to France for the sake of the liberty of their country and of mankind to understand the purposes of the war and the needs of the Government to prosecute it to a successful conclusion. The committee and its organization achieved a high degree of success in arousing the sentiment of the people and in obtaining subscriptions to the securities of the Government.

LIBERTY BONDS AND VICTORY NOTES OUTSTANDING.

On June 30, 1919, the total amount of Liberty bonds and Victory notes outstanding and deliverable was \$19,126,517,200. Exclusive of interim certificates which were issued only in connection with the first Liberty loan, this large amount was distributed in 78,710,703 pieces, represented by denominations ranging from \$50 to \$100,000. Of that number, 39,932,957, or more than one-half, consisted of \$50 bonds and notes. The number of \$50 and \$100 bonds and notes outstanding was 66,644,458, or more than 84 per cent of the total, while the number of \$50, \$100 and \$500 bonds and notes was 70,244,817, or more than 89 per cent of the total. These percentages would have been increased if the entire Victory loan had been issued by June 30. The Victory notes were in process of issue at that time and only a part of the total was outstanding at the close of the fiscal year.

The amount represented by the \$50 denomination on June 30, 1919, was \$1,996,647,850; by the \$100 denomination \$2,671,150,100; by the \$500 denomination \$1,800,179,500, and by the \$1,000 denomination \$7,936,230,000. These figures show that \$6,467,977,450 was represented by \$50, \$100 and \$500 bonds and notes, or approximately 33 per cent of the total outstanding. The combined total of \$50,

\$100, \$500 and \$1,000 denominations amounted to \$14,404,207,450, or 75 per cent of the total outstanding, while the combined total of the denominations ranging from \$50 to \$10,000 was \$18,331,117,450, or 95 per cent of the total amount outstanding.

While the large number of small bonds and notes which were still outstanding at the close of the fiscal year is encouraging as indicating the continued widespread distribution of the bonds among investors who never before had placed their savings in securities of any kind, unfortunately it is unquestionably true that a large number of small holders have parted with their bonds and notes when it was most desirable for themselves and their Government that they should hold them as investments. There is attached hereto as Exhibit 50, page 324, a detailed statement of denominational exchanges of all coupon Liberty bonds and Victory notes, by Federal reserve districts, up to September 30, 1919. The original deliveries of \$50 coupon bonds and notes amounted to \$2,661,386,150. Of these there was surrendered for denominational exchange a total of \$737,-806,600 and there was issued on denominational exchange a total of \$189,987,000 of \$50 coupon bonds and notes, making a net decrease in the amount of outstanding \$50 coupon bonds and notes on September 30, 1919, of \$547,819,600. The original deliveries of \$100 coupon bonds and notes amounted to \$3,196,166,800. Of these there was surrendered for denominational exchange a total of \$576,-129,500, and there was issued on denominational exchange a total of \$132,848,100 of \$100 coupon bonds and notes, making a net decrease in the amount of outstanding \$100 coupon bonds and notes on September 30, 1919, of \$443,281,400. The original deliveries of \$1,000 coupon bonds and notes amounted to \$9,417,227,000. Of these there was surrendered for denominational exchange a total of \$445,039,000, and there was issued on denominational exchange a total of \$1,540,-545,000 of \$1,000 coupon bonds and notes, making a net increase in the amount of outstanding \$1,000 coupon bonds and notes of \$1,095,-506,000 on September 30, 1919.

It is obviously impossible to demonstrate what proportion of the bonds and notes surrendered for the purposes of exchange into other denominations have been sold, but unquestionably a large part of the transactions mentioned above represent sales of the small denominations. This assumption is borne out by the large amount of such bonds or notes which were exchanged for higher denominations, particularly the \$1,000 denomination. The observation of the Department has been that in practically all cases the high point of surrender of the securities for the purpose of exchange appears to be at or near the termination of the life of partial payment plans. This would indicate that many small investors, as soon as they com-

plete the payment for their securities, offer them on the market for sale. It is a great mistake for the people of the country, who patriotically bought the Government's obligations during the period of the war, to forego the great advantages which accrue to them by holding their securities. They represent savings which will improve their welfare, and rather than part with them they should determine upon a course of further saving and invest their accumulations in Government obligations. It is sincerely to be hoped that all holders of Liberty bonds and Victory notes will retain and increase their investments and dispose of them only under the pressure of compelling necessity.

The following table shows in detail the outstanding issues of Liberty bonds and Victory notes, by denominations, at the close of the fiscal year.

Liberty bonds and Victory notes outstanding, by denominations, June 30, 1919.

Loans.	Total.									
	\$50	\$100	\$500	\$1,000	\$5,000	\$10,000	\$50,000	\$100,000

A recapitulation of transactions in Liberty bonds and Victory notes from the dates of the respective issues to June 30, 1919, separately compiled for each loan, is embraced in Exhibit 51, page 338. These figures indicate that in the vast operations of the five loans the department issued securities of an aggregate value of \$27,868,140,100, of which \$8,814,442,250 had been retired through conversion, exchange, purchase, etc. Including \$72,819,350 of securities in process of issue against securities canceled, the amount outstanding on June 30, 1919, was, as stated above, \$19,126,517,200.

There is attached hereto Form L & C 265, dated October 16, 1919, which shows the dates on which interest on the various issues of Liberty bonds and Victory notes is payable and the amount of any interest coupon pertaining to any bond or note of the Liberty issues.

CONVERSION OF LIBERTY BONDS.

On January 15, 1919, attention of the Congress was drawn to the fact that a large number of holders of 4 per cent Liberty bonds had not exercised the privilege of converting such bonds into 4½ per cent bonds, and announcement was made that a recommendation would be submitted for the extension of the privilege, which had expired on November 9, 1918. It was believed that those who had not availed themselves of the conversion privilege fell chiefly among the group of small holders who were unaccustomed to bond investments and who, on account of the very wide distribution of Liberty bonds, were not reached by the general public announcements of the Treasury and could not, except in the case of registered bonds, be reached by department circular. The Congress adopted the recommendation of the Treasury, and in section 5 of the Victory Liberty loan act authorized the extension of the privilege of converting the 4 per cent bonds of the first Liberty loan converted and the 4 per cent bonds of the second Liberty loan into 4½ per cent bonds for such period and upon such terms and conditions and subject to such rules and regulations as the Secretary of the Treasury may prescribe. Regulations governing these conversions are embodied in Department Circular No. 137, dated March 7, 1919, and in the supplements thereto dated June 10, 1919, and November 1, 1919. Under the terms of these circulars the extended privilege may be terminated on six months' public notice given in such manner as the Secretary of the Treasury shall prescribe.

In spite of this extension of the conversion privilege and the publicity which has been given to it, approximately \$750,000,000 face amount of 4 per cent Liberty bonds in coupon form remained outstanding unconverted on September 1, 1919. Of these coupon bonds, the second Liberty loan 4 per cent bonds had no coupons attached for interest accruing after November 15, 1919, and the first Liberty

loan converted 4 per cent bonds had no coupons attached for interest accruing after December 15, 1919. On and after said dates, respectively, these bonds would become exchangeable, according to their terms, for like bonds with all subsequent coupons attached, but if not presented for conversion until said dates, respectively, would not be deemed to be converted until May 15 and June 15, 1920, respectively, and the bonds issued upon conversion would not begin to bear interest at $4\frac{1}{4}$ per cent per annum until said dates. The $4\frac{1}{4}$ per cent bonds so issued would have no coupons attached, and would be exchangeable on and after said dates, respectively, for like bonds with all subsequent coupons attached.

In order to avoid expense to the United States and inconvenience to holders of the 4 per cent coupon Liberty bonds, and in order to make the necessary provisions for the payment of the 4 per cent interest accruing thereon after November 15 and December 15, 1919, respectively, special rules and regulations were accordingly prescribed governing the exchange and conversion of 4 per cent coupon bonds of the second Liberty loan and of the first Liberty loan converted. These rules and regulations are set forth in full in Treasury Department Circular No. 158, dated September 8, 1919, and are in substance as follows:

(1) Holders of 4 per cent coupon bonds of the second Liberty loan and of the first Liberty loan converted desiring to avail themselves of the conversion privilege were urged to present them for conversion promptly, *before* November 15, 1919, and December 15, 1919, respectively, and it was provided that in that event they would be deemed to present their bonds for conversion only and would receive upon such conversions bonds bearing interest at $4\frac{1}{4}$ per cent per annum from November 15, 1919, and December 15, 1919, respectively, with coupons attached covering interest to May 15, 1920, and June 15, 1920, respectively.

(2) Holders of 4 per cent coupon bonds of the second Liberty loan and of the first Liberty loan converted desiring to avail themselves of the conversion privilege but neglecting to present their bonds for conversion before November 15, 1919, and December 15, 1919, respectively, were advised to retain their 4 per cent coupon bonds temporarily until the Treasury Department should announce that the $4\frac{1}{4}$ per cent coupon bonds of the second Liberty loan converted and of the first Liberty loan converted with coupons attached covering interest to maturity were available for delivery (which, it is expected, will be about March 15, 1920), and then present their 4 per cent bonds promptly for conversion and exchange into such $4\frac{1}{4}$ per cent bonds. In this connection, it was provided that all 4 per cent coupon Liberty

bonds presented on or after November 15, 1919, and December 15, 1919, respectively, for exchange into bonds with all subsequent coupons attached would, unless otherwise expressly indicated in writing by the holder, be deemed to be presented for conversion into 4½ per cent bonds, as well as for exchange, and be held in suspense pending the date when the 4½ per cent bonds with all subsequent coupons attached should be available for delivery.

(3) It was further provided that, after November 15, 1919, and December 15, 1919, respectively, 4 per cent bonds of the second Liberty loan and of the first Liberty loan converted, with all subsequent coupons attached, would be issued in exchange for the 4 per cent bonds for which they are expressed to be exchangeable, if specifically requested, but that it was not expected that such permanent 4 per cent bonds would be available for delivery before March 15, 1920.

The following statement, by denominations, of unconverted 4 per cent bonds outstanding on June 30, 1919, indicates that the amount is chiefly in the hands of small investors:

Outstanding June 30, 1919.

Denomination.	First 4's.	Second 4's.
\$50	\$42,919,850	\$167,303,650
100	53,561,400	187,833,700
500	27,226,500	97,766,000
1,000	37,985,000	192,011,000
5,000	3,180,000	24,560,000
10,000	2,620,000	24,080,000
50,000	300,000	7,650,000
100,000	-----	3,000,000
	167,792,750	704,204,350

On April 24, 1919, the privilege of converting 3½ per cent bonds of the first Liberty loan into first Liberty loan second converted 4½ per cent bonds expired pursuant to the terms of Department Circular No. 123, dated October 24, 1918, set forth as an exhibit to the previous annual report. Only \$3,492,050 face amount of 4½ per cent bonds were issued pursuant to this conversion privilege.

The following tabulation shows the total conversions of Liberty bonds from the dates when the respective privileges arose to the termination thereof, or to June 30, 1919:

First Liberty loan converted 4 per cent bonds of 1932-1947, Nov. 15, 1917-May 15, 1918.

Surrendered for conversion:

First Liberty loan 3½ per cent interim certificates of 1932-1947 . . .	\$473,917,250
First Liberty loan 3½ per cent coupon bonds of 1932-1947	89,103,500
First Liberty loan 3½ per cent registered bonds of 1932-1947	5,297,700
Total	<u>568,318,450</u>

Issued upon conversion:

First Liberty loan converted 4 per cent coupon bonds of 1932-1947.	\$498, 275, 700
First Liberty loan converted 4 per cent registered bonds of 1932-1947.	70, 042, 750
Total	568, 318, 450

First Liberty loan converted 4½ per cent bonds of 1932-1947, as of June 30, 1919.

Surrendered for conversion:

First Liberty loan 3½ per cent coupon bonds of 1932-1947.	\$6, 118, 650
First Liberty loan 3½ per cent registered bonds of 1932-1947.	1, 454, 800
First Liberty loan converted 4 per cent coupon bonds of 1932-1947.	344, 648, 850
First Liberty loan converted 4 per cent registered bonds of 1932-1947.	53, 220, 850
Total	405, 443, 150

Issued upon conversion:

First Liberty loan converted 4½ per cent coupon bonds of 1932-1947.	326, 718, 150
First Liberty loan converted 4½ per cent registered bonds of 1932-1947.	78, 725, 000
Total	405, 443, 150

First Liberty loan second converted 4½ per cent bonds of 1932-1947, Oct. 24, 1918-Apr. 24, 1919.

Surrendered for conversion:

First Liberty loan 3½ per cent coupon bonds of 1932-1947.	\$2, 900, 550
First Liberty loan 3½ per cent registered bonds of 1932-1947.	591, 500
Total	3, 492, 050

Issued upon conversion:

First Liberty loan second converted 4½ per cent coupon bonds of 1932-1947.	2, 442, 900
First Liberty loan second converted 4½ per cent registered bonds of 1932-1947.	1, 049, 150
Total	3, 492, 050

Second Liberty loan converted 4½ per cent bonds of 1927-1942, as of June 30, 1919.

Surrendered for conversion:

Second Liberty loan 4 per cent coupon bonds.	\$2, 715, 294, 400
Second Liberty loan 4 per cent registered bonds.	319, 315, 450
Total	3, 034, 609, 850

Issued upon conversion:

Second Liberty loan 4½ per cent coupon bonds.	2, 620, 595, 200
Second Liberty loan 4½ per cent registered bonds.	414, 014, 650
Total	3, 034, 609, 850

No privilege of conversion arose with respect to previous issues of Government securities by reason of the issue of Victory notes.

INTERCONVERSION OF VICTORY NOTES.

Under the terms of the offering of the Victory Liberty loan, the two series of notes of that issue, bearing interest, respectively, at $3\frac{1}{4}$ per cent and $4\frac{1}{4}$ per cent per annum, are freely interconvertible throughout their life, subject to the terms of the circular offering the notes and the rules and regulations of the Secretary of the Treasury. Rules and regulations governing the exercise of the conversion privilege are embodied in Department Circular No. 139, dated May 20, 1919, and supplement thereto, dated November 1, 1919. The issue of the notes upon full-paid subscriptions was sufficiently advanced to permit the opening of the conversion privilege on July 15, 1919.

EXCHANGE AND TRANSFER OF LIBERTY BONDS AND VICTORY NOTES.

From the beginning of the war to the close of the fiscal year 1919 there were 17,373,132 Liberty bonds and Victory notes exchanged or transferred in an aggregate face amount of \$2,661,104,450, the transactions including exchange of coupon for registered issues, and vice versa, denominational exchanges and transfers of registered issues. Transactions involving coupon issues only were conducted chiefly at the Federal reserve banks as fiscal agents of the United States. While some transactions in connection with the registered issues were conducted in part at the Federal reserve banks, all such exchanges or transfers are finally consummated at the Treasury, where the record of registered bonds is kept.

Treasury Department Circular No. 141, dated September 15, 1919, establishes rules and regulations governing transactions in Liberty bonds and Victory notes. There was also issued on the same date a statement giving information with respect to the registration of bonds and notes. The widest possible distribution of these announcements has been made in order to familiarize the people with the method of effecting exchanges and transfers. A copy of the circular and of the statement were sent to every bank and trust company in the United States, accompanied by a letter urging their cooperation in handling transactions for their customers.

This circular covers the matter of exchange and transfer of Liberty bonds and Victory notes in detail, including such important matters as assignments in case of death of a registered owner, assignments for minors, and the rules respecting bonds or notes registered in the names of two or more persons. It also sets forth the officers authorized to witness assignments. The Treasury is anxious to facilitate the assignments of registered bonds and notes, but its policy in this

respect must be controlled by considerations of safety to the Government and to the registered holder. The department believes it has gone as far as it may with security in conferring general authority with respect to witnessing assignments. The Treasury must rely upon the good faith of the witnessing officer in requiring positive identification of the registered holder executing the assignment, and it is deemed wise to restrict the general authority to witness assignments to certain Treasury and other Federal officers, the executive officers of the Federal reserve banks, and the executive officers of incorporated banks and trust companies.

From the beginning of the war-loan operations the Treasury has been particularly anxious to afford every possible inducement to investors in Government securities to hold them in registered form. This is particularly desirable in the case of the small denominations which are in the hands of people who have no facilities for safekeeping, and the department has repeatedly urged upon the public the great advantages of registration. The result of its efforts in this direction may be seen from the fact that the registered issues of the first four loans up to June 30, 1919, had increased over \$600,000,000 from the time of original deliveries.

PURCHASES OF LIBERTY BONDS BY THE TREASURY.

The authority conferred upon the Secretary of the Treasury by section 6 of the act approved April 4, 1918 (Third Liberty bond act), to purchase Liberty bonds in order to stabilize the market prices of the securities, has been exercised from time to time during the year. Liberty bonds have been purchased, canceled and retired in accordance with the law, as necessary to support the market. As a matter of practical convenience the services of the War Finance Corporation have been utilized in this connection. The bonds have been purchased by the corporation at the market price for its own account, and subsequently the accumulated stocks have been taken over by the Treasury at the average cost to the corporation, plus accrued interest.

These purchases have served the purposes of the law, particularly when heavy sales were pressing upon the market. Many of these sales were the result of conditions produced by the ending of the war. Some of the smaller holders, who changed their occupations during the winter on account of the dislocation of industries, found it necessary to dispose of their securities. Large corporations that during the war had been able to hold Government bonds, either with their own resources or on borrowed capital, also found it necessary to liquidate on account of changed financial conditions due to economic dislocation attendant upon the ending of the war. During all this period without endeavoring to hold the bonds to levels that could

not be maintained, it was the constant endeavor of the Treasury to maintain the stability of the market for Government securities. The terms of the Victory loan had a favorable influence on the market situation.

The following bonds have been purchased, canceled, and retired by the Treasury from the bond-purchase fund to November 15, 1919:

Liberty bonds purchased from bond-purchase fund from Apr. 12, 1918, to Nov. 15, 1919.

Loan.	Principal amount purchased.	Amount paid.	Amount of accrued interest paid.
First Liberty loan converted 4 per cent and $4\frac{1}{2}$ per cent bonds of 1932-1947.....	\$25,115,000	\$23,841,677.60	\$398,633.59
Second Liberty loan 4 per cent and converted $4\frac{1}{2}$ per cent bonds of 1927-1942.....	371,215,000	353,346,965.55	6,364,544.95
Third Liberty loan $4\frac{1}{2}$ per cent bonds of 1928.....	208,635,500	200,895,398.00	1,687,060.05
Fourth Liberty loan $4\frac{1}{2}$ per cent bonds of 1933-1938.....	348,115,000	329,821,485.00	5,052,217.71
Total.....	953,080,500	907,905,526.15	13,502,456.30

The difference between the par amount of bonds purchased and the principal amount paid therefor, \$45,174,973.85, appears on the books of the Treasury as a miscellaneous receipt.

Section 3 of the act approved April 24, 1917 (first Liberty bond act), and section 3 of the act approved September 24, 1917 (second Liberty bond act), as amended, authorize the Secretary of the Treasury to apply any repayments of the principal of loans to foreign Governments to the redemption or purchase of any bonds issued under authority of such acts. Certain of the loans to foreign Governments have been repaid, as stated elsewhere in this report under the heading "Loans to foreign Governments," and the proceeds of the repayments have been applied to the purchase of Liberty bonds, which have been canceled and retired, as follows:

Bonds purchased as the result of payment of foreign loans, to Nov. 15, 1919.

OBLIGATIONS OF FOREIGN GOVERNMENTS REPAID.

Government.	Date.	Amount repaid.
France.....	Jan. 1, 1919	\$3,384,000.00
Do.....	Mar. 31, 1919	588,000.00
Do.....	Mar. 14, 1919	3,598,000.00
Belgium.....	July 18, 1919	10,000.00
France.....	Aug. 11, 1919	4,577,000.00
Great Britain.....	do.....	22,000,000.00
Do.....	Sept. 18, 1919	10,000,000.00
Do.....	Sept. 23, 1919	10,000,000.00
Do.....	Oct. 11, 1919	7,164,007.99
Do.....	Oct. 27, 1919	8,000,000.00

Bonds purchased as the result of payment of foreign loans, to Nov. 15, 1919—Continued.

BOND PURCHASES.

Loan.	Principal amount purchased.	Amount paid.	Amount of accrued interest paid.
Third Liberty loan 4½ per cent bonds of 1928.....	\$62, 297, 200	\$59, 090, 313. 78	\$702, 901. 66
Fourth Liberty loan 4½ per cent bonds of 1933-1938.....	2, 514, 950	2, 230, 482. 32	51, 690. 47
Total.....	64, 812, 150	61, 320, 796. 10	754, 592. 13

The bond-purchase fund, while designed primarily for another and more immediate purpose, has operated also, as the above analysis shows, in the nature of a preliminary sinking fund in advance of the operation of a scientific plan for the retirement of the debt through purchases or redemptions over a period of years. The authority to purchase bonds through the bond-purchase fund expires one year after the termination of the war. The Congress, however, has already provided the plan for the gradual retirement of the debt by means of a cumulative sinking fund.

CUMULATIVE SINKING FUND.

Provision for the establishment of a cumulative sinking fund in the Treasury for the retirement of bonds and notes issued under the first, second, third, and fourth Liberty bond acts and the Victory Liberty loan act is made by section 6 of the act approved March 3, 1919, in accordance with recommendations submitted by the Treasury and adopted by the Congress. The law permanently appropriates for such sinking fund for the fiscal year beginning July 1, 1920, and for each fiscal year thereafter until the debt is discharged an amount equal to the sum of "(1) 2½ per centum of the aggregate amount of such bonds and notes outstanding on July 1, 1920, less an amount equal to the par amount of any obligations of foreign governments held by the United States on July 1, 1920, and (2) the interest which would have been payable during the fiscal year for which the appropriation is made on the bonds and notes purchased, redeemed, or paid out of the sinking fund during such year or in previous years."

It will be noted that the Secretary of the Treasury, in accordance with the terms of this law, will ascertain the aggregate amount of such bonds and notes outstanding on July 1, 1920, less the par amount of obligations of foreign governments held by the United States on that date. Two and one-half per cent of that sum is appropriated annually as a fixed amount and without variation for the payment of such bonds and notes at maturity or for their redemption or purchase before maturity. As bonds or notes are paid,

redeemed, or purchased from this appropriation, there is also appropriated yearly and cumulatively for the sinking fund an amount equivalent to the interest which would have been payable on such bonds or notes if they had not been retired.

A cumulative sinking fund has the advantage of making the amount to be set aside for the service of the debt both on account of interest and sinking fund substantially a permanent item at a fixed figure until the debt is retired. The maturities and redemption dates for Liberty loan bonds, as stated in my testimony before the Ways and Means Committee, were arranged with great wisdom and thoughtfulness by Secretary McAdoo, the bonds of the second loan being redeemable during the period between 1927 and 1942, those of the third loan being payable in 1928, those of the fourth loan being redeemable during the period between 1933 and 1938, and those of the first loan being redeemable during the period between 1932 and 1947. The notes of the Victory Liberty loan are of short maturity, being redeemable in 1922 and payable in 1923. With redemption dates and maturities stretching over the period from 1922 to 1947, it will always be in the power of the Government to use the sinking fund effectively for the redemption or payment of bonds and notes of the Liberty loans.

It is calculated that the operation of the cumulative sinking fund provision will retire the funded war debt of the United States in the neighborhood of twenty-five years, except with respect to an amount equal to the loans to foreign governments outstanding on July 1, 1920. The retirement of the latter is provided for by the authority to apply repayments of foreign obligations to the retirement of United States obligations, and as foreign obligations are paid a corresponding amount of United States obligations may be redeemed or purchased, and canceled and retired.

The act of March 3, 1919, also repealed the old sinking-fund statutes which had proved unworkable and resulted in nothing more or less than a bookkeeping account. They did not retire the debt. The new law which takes the place of the provisions thus repealed can never descend to the state of uselessness which they occupied as long as the Government keeps faith with investors in its obligations. The formal offering of the Victory Liberty loan by Department Circular No. 138 quoted the cumulative sinking-fund section of the Victory Liberty loan act. To make the plan effective, sinking-fund charges must be met out of revenues received from taxation. Any thought in the future of suspending the operation of the cumulative sinking fund or of meeting its charges through the sale of securities would be not only unwise in the extreme from the standpoint of the Government's finances and the ultimate wiping out of the war debt

but would be a breach of faith with every subscriber to the Victory Liberty loan and with every holder of the Liberty bonds. Whatever may be necessary in the future financing of the Government, nothing must be permitted to interfere with the effective operation of the cumulative sinking fund and the consequent gradual retirement of the war debt.

VICTORY LIBERTY LOAN SUBSCRIPTIONS BY PERSONS IN THE MILITARY AND NAVAL FORCES.

At the time of the Victory Liberty loan campaign, both military and naval forces were undergoing rapid demobilization, and the efforts of the Treasury and of the War and Navy Departments in connection with the purchase of Victory notes by soldiers and sailors were directed chiefly toward affording them full opportunity to place subscriptions on reasonable terms. Under date of April 21, 1919, the Secretary of the Treasury promulgated regulations defining special arrangements for subscriptions from persons in the military forces. These regulations followed the same general lines as were in force for the third and fourth Liberty loans, as reported in the annual report for the fiscal year 1918, payments being made, however, by reservations from pay instead of by allotments of pay. In addition, Treasury regulations defining special arrangements for subscriptions by persons in the naval forces were prescribed by the Secretary for the first time, under date of April 21, 1919. These regulations followed the same lines as those prescribed for the Army, payment being made for the notes subscribed for by means of checkages against pay. Cash sales to persons in the military and naval forces also were made in considerable amounts during the campaign with the cooperation of the respective departments.

The total subscriptions for Victory notes reported by the Army under the special regulations, including cash sales, amounted to \$1,906,050, and the total subscriptions reported by the Navy under the special plan, including cash sales, amounted to \$6,912,750.

Apart from the subscriptions made by members of the military and naval forces, many officers and men, by speeches and other activities, imparted a marked additional stimulus to the general Liberty loan campaign.

ACCEPTANCE OF LIBERTY BONDS AS SECURITY.

In accordance with the recommendation contained in the annual report for the fiscal year 1918, provision was made by section 1320 of the revenue act of 1918, approved February 24, 1919, for the acceptance of Liberty bonds and other United States bonds as security in

lieu of surety or sureties on penal bonds. For the purpose of this statute, the term penal bond is defined to include any recognizance, stipulation, bond, guaranty, or undertaking, with surety or sureties, required to be furnished by the laws of the United States or regulations made pursuant thereto. Pursuant to the authority so conferred, the Secretary has prescribed detailed rules and regulations for carrying the section into effect, in Treasury Department Circular No. 154, dated June 30, 1919. Complete figures as to the bonds deposited in lieu of surety or sureties pursuant to this circular are not available, inasmuch as the bonds may be accepted by bond-approving officers of the Government generally, and may be deposited with the Federal reserve banks and branches as well as with the Treasurer of the United States. More than \$520,000 face amount of bonds so accepted, however, had been deposited with the Treasurer of the United States up to October 31, 1919.

Special regulations also have been issued in line with this statute and circular, under which Liberty bonds may be accepted as security in lieu of penal bonds to secure the payment of floor taxes on distilled spirits, tobacco manufactures, and other commodities, and as security for claims for abatement, and in connection with replacement funds. The following amounts of Liberty bonds have been received by the Bureau of Internal Revenue and held as security for the payment of floor taxes or otherwise taken as security in lieu of sureties:

Received during the fiscal year ended June 30, 1918.....	\$4,431,450
Received during the fiscal year ended June 30, 1919.....	1,269,300
Received from June 30 to Oct. 31, 1919.....	5,050
Total.....	5,705,800

ACCEPTANCE OF LIBERTY BONDS AND VICTORY NOTES IN PAYMENT OF ESTATE OR INHERITANCE TAXES.

As stated in the annual report for the fiscal year 1918, the act of April 4, 1918, added a new section, 14, to the act approved September 24, 1917, known as the second Liberty bond act, providing that bonds of the United States bearing interest at a higher rate than 4 per cent per annum might be accepted at par and accrued interest, under rules and regulations prescribed by the Secretary of the Treasury, in payment of estate or inheritance taxes imposed by the United States, if owned continuously by the decedent for at least six month prior to the date of death and a part of his estate at the time of death. Pursuant to this section, detailed rules and regulations governing the acceptance of Liberty bonds for estate or inheritance taxes were prescribed by the Secretary in Treasury Department Circular No. 132, dated January 30, 1919. The act of March 3, 1919,

known as the Victory liberty loan act (Exhibit 7, page 235) added to the second Liberty bond act a new section, No. 18, authorizing the issue of notes of the United States, subdivision (d) of which extended the provisions above described to notes issued under authority of said section. Pursuant to this provision, the 4½ per cent Victory notes will be receivable in payment of estate or inheritance taxes, and rules and regulations governing their acceptance have been prescribed in Treasury Department Circular No. 151, dated June 24, 1919. The 3½ per cent Victory notes are not under existing law acceptable in payment of estate or inheritance taxes.

The following table shows the total face amounts of Liberty bonds accepted in payment of estate or inheritance taxes up to and including October 31, 1919:

Loan.	Par amount of bonds.	Interest paid.
First Liberty loan converted 4½ per cent bonds.....	\$16,450	\$101.72
Second Liberty loan converted 4½ per cent bonds.....	143,350	1,439.68
Third Liberty loan 4½ per cent bonds.....	109,300	1,324.13
Fourth Liberty loan 4½ per cent bonds.....	2,000	29.37
Total.....	271,100	2,894.90

LOANS SECURED BY OBLIGATIONS OF THE UNITED STATES.

Section 5200 of the Revised Statutes as amended by the acts of September 24, 1918, March 3, 1919, and October 22, 1919, authorizes any national bank to lend to a single borrower, on the security of Liberty bonds, Victory notes, or Treasury certificates of indebtedness, to a practically unlimited extent if such loans conform to the regulations prescribed by the Comptroller of the Currency with the approval of the Secretary of the Treasury. Under these regulations it is provided that in addition to a loan amounting to 10 per cent of the unimpaired capital and surplus fund, already permitted by law, a national bank may grant another loan to the same borrower amounting to 10 per cent of the unimpaired capital and surplus if secured by a like face amount of Liberty bonds, Victory notes, and certificates of indebtedness of the United States issued since April 24, 1917, and a further unlimited amount if secured by such obligations having a face value of \$105 for every \$100 loaned.

It is believed that this increased authority to lend on the security of Government obligations had a very beneficial effect in aiding in the flotation of the fourth Liberty loan, the largest of the four Liberty loans placed, and also aided in the placing of the Victory notes.

The regulations promulgated by the Comptroller of the Currency and approved by the Secretary of the Treasury enabled the national banks to make these loans to an unlimited extent as long as the loans were secured by 105 per cent of Liberty bonds, Victory notes,

or Treasury certificates of indebtedness, "until December 31, 1920, or until such later date as the Comptroller of the Currency, with the approval of the Secretary of the Treasury, may prescribe."

The mere fact that national banks had the right to lend to customers on the security of Liberty bonds to this unlimited extent had a stimulating effect even upon buyers of Liberty bonds who did not have occasion to pledge their holdings. The knowledge that they could borrow on them if they needed to do so naturally encouraged many to subscribe for more than they would otherwise have taken.

The sworn reports of the national banks show that on September 12, 1919, the total amount of Liberty bonds of all issues upon which all national banks were lending was \$915,211,000.

The amount of Treasury certificates of indebtedness upon which the national banks were lending on the same date was \$32,379,000.

These figures are interesting when we consider that the total amount of Liberty bonds placed through the national banks was \$8,603,711,205, or 50.6 per cent, a majority of the entire allotments by the Government, amounting to approximately \$17,000,000,000.

These records, therefore, show that on September 12, 1919, the national banks were making loans on less than 5½ per cent of the total amount of Liberty bonds which the Government allotted.

The amount of Victory notes allotted by the Government was \$4,500,000,000. On September 12, 1919, the national banks reported that the total amount of Victory notes held as collateral aggregated \$297,819,000.

LIBERTY LOAN SUBSCRIPTIONS IN DEFAULT.

Pursuant to the provisions of Treasury Department Circular No. 78, dated May 14, 1917, offering the first Liberty loan for subscription, the Secretary of the Treasury has declared forfeited all delinquent first Liberty loan subscriptions filed with an official agency, together with all payments made thereon and all right and interest in the bonds allotted. This forfeiture was declared by Treasury Department Circular No. 135, dated February 5, 1919. Pursuant to this circular all forfeited installment payments are covered into the Treasury to the credit of miscellaneous receipts.

Similar action has been taken pursuant to the provisions of Treasury Department Circular No. 90, dated October 1, 1917, offering the second Liberty loan for subscription, as to all delinquent subscriptions to the second Liberty loan, by Treasury Department Circular No. 156, dated November 15, 1919.

COUPON LIBERTY BONDS IN PERMANENT FORM.

The difficulties experienced in the issue of coupon bonds of the first Liberty loan, to which were attached coupons covering interest to the final maturity date, together with the possibilities of conversions pursuant to the conversion privilege and the certainty that large numbers of coupon bonds would be exchanged for registered bonds, caused the Treasury, beginning with the 4 per cent bonds of the second Liberty loan, to issue coupon bonds in so-called temporary form—that is, with coupons attached covering interest for only two years or two years and a fraction. This procedure has enabled the department to make early delivery of coupon bonds subscribed for and has materially reduced the loss which would otherwise have been involved in the cancellation, upon conversion or exchange, of bonds with all coupons to maturity attached. The determining factor responsible for the issue of these temporary bonds, however, was the impossibility of printing bonds by the million of pieces for delivery within any reasonable period if such bonds were to have attached thereto coupons covering interest to the final maturity of the loan. The work of preparing coupon bonds of the several issues with coupons attached covering interest from the date of the last coupon originally attached to the date of final maturity with respect to each loan is proceeding satisfactorily at the Bureau of Engraving and Printing. It is expected that the $4\frac{1}{4}$ per cent bonds of the third Liberty loan will be available for delivery on and after March 15, 1920; that the $4\frac{1}{4}$ per cent bonds of the second Liberty loan converted will be available for delivery on and after May 15, 1920; that the $4\frac{1}{4}$ per cent bonds of the first Liberty loan converted will be available for delivery on and after June 15, 1920; that the $4\frac{1}{4}$ per cent bonds of the fourth Liberty loan will be available for delivery on and after October 15, 1920; and that the $4\frac{1}{4}$ per cent bonds of the first Liberty loan second converted will be available for delivery on and after December 15, 1920. The 4 per cent bonds of the first Liberty loan converted and the 4 per cent bonds of the second Liberty loan will be available for delivery on or about March 15, 1920, and every effort will be made to have the $4\frac{1}{4}$ per cent bonds of the first Liberty loan converted and of the second Liberty loan converted available for delivery on or about the same date.

In accordance with the terms of the so-called temporary bonds originally issued, such bonds are exchangeable, without charge by the United States, on and after the maturity date of the last coupons thereto attached for like bonds with all subsequent coupons attached. The department is proceeding with arrangements to

provide for these exchanges with the least possible inconvenience to the holders, and the public will be advised with respect thereto by Treasury Department circular prescribing full rules and regulations.

OFFICIAL TITLES OF LIBERTY BONDS AND VICTORY LIBERTY NOTES.

Recognizing the need for short titles for the various issues of Liberty bonds and Victory Liberty notes, the Treasury has given its official sanction to the use of certain abbreviated titles that are fairly descriptive of the respective loans. These will serve as a matter of convenience in connection with the daily transactions in these securities, and it is to be hoped that banks, newspapers and all others having occasion to refer to the bonds and notes will employ the officially approved short titles so that the people of the country may become so familiar with the names of the respective issues that they will readily identify them and thus be protected from misrepresentation with respect to any of the outstanding securities. Following are the official or formal titles of the several issues and the approved short titles thereof:

Formal titles.	Short titles.
First Liberty loan $3\frac{1}{2}$ per cent bonds of 1932-47.....	First $3\frac{1}{2}$'s.
First Liberty loan converted 4 per cent bonds of 1932-47.....	First 4's.
First Liberty loan converted $4\frac{1}{4}$ per cent bonds of 1932-47.....	First $4\frac{1}{4}$'s.
First Liberty loan second converted $4\frac{1}{4}$ per cent bonds of 1932-47.....	First Second $4\frac{1}{4}$'s.
Second Liberty loan 4 per cent bonds of 1927-42.....	Second 4's.
Second Liberty loan converted $4\frac{1}{4}$ per cent bonds of 1927-42....	Second $4\frac{1}{4}$'s.
Third Liberty loan $4\frac{1}{4}$ per cent bonds of 1928.....	Third $4\frac{1}{4}$'s.
Fourth Liberty loan $4\frac{1}{4}$ per cent bonds of 1933-38.....	Fourth $4\frac{1}{4}$'s.
Victory Liberty loan $4\frac{3}{8}$ per cent convertible gold notes of 1922-23.....	Victory $4\frac{3}{8}$'s.
Victory Liberty loan $3\frac{3}{8}$ per cent convertible gold notes of 1922-23.....	Victory $3\frac{3}{8}$'s.

AUTHORIZATIONS FOR ISSUES OF LIBERTY BONDS AND VICTORY NOTES.

The Secretary of the Treasury was authorized by the first, second, third, and fourth Liberty bond acts to issue bonds in amounts aggregating \$22,000,000,000. The authority has been exercised to the extent of \$16,977,335,850, leaving a balance of Liberty bonds which may be issued under existing law of \$5,022,664,150. By the Victory Liberty loan act the Secretary was authorized to issue notes of the United States to the aggregate amount of \$7,000,000,000. Deducting the amount of allotted subscriptions to the Victory Liberty loan, corrected to September 30, 1919, namely \$4,498,312,650, the balance of Victory notes which may be issued under existing law is approximately \$2,501,687,350. The following statement summarizes the authorizations for bonds and notes, the issues, and the amount of such securities that may be issued under existing law.

The first Liberty bond act (Apr. 24, 1917) authorized new issues of bonds not to exceed..... \$5, 000, 000, 000

The same act authorized the issue under the terms of such act of the unissued bonds previously authorized as follows:

For construction of Panama Canal (act Aug. 5, 1909), but including the unissued Panama Canal bonds authorized to be issued for the nitrate plant (act June 3, 1916) and for the Shipping Board (act Sept. 7, 1916), the amount of issued postal-savings bonds being deducted from the amount authorized (approximately).....	225, 000, 000
For extraordinary expenditures (act Mar. 3, 1917).....	100, 000, 000
For expediting naval construction (act Mar. 4, 1917).....	150, 000, 000
And an additional amount to provide for payment of loan of 1908-1918.....	63, 945, 460

Total authorization under first Liberty bond act.....	5, 538, 945, 460
First Liberty loan subscriptions allotted.....	2, 000, 000, 000
Balance bonds unissued under first Liberty bond act.....	3, 538, 945, 460

The second Liberty bond act (Sept. 24, 1917) authorized the issue of bonds (in addition to the \$2, 000, 000, 000 allotted under the first Liberty bond act), not to exceed in the aggregate..... 7, 538, 945, 460

And provided that of such sum \$3, 538, 945, 460 should be in lieu of unissued bonds authorized by the first Liberty bond act.

The third Liberty bond act (Apr. 4, 1918) increased the authority for the issue of bonds to..... 12, 000, 000, 000

The fourth Liberty bond act (July 9, 1918) further increased such authority to..... 20, 000, 000, 000

Issues of Liberty bonds under second Liberty bond act and under such act as amended:

Subscriptions allotted—

Second Liberty loan.....	\$3, 807, 891, 900
Third Liberty loan.....	4, 176, 516, 850
Fourth Liberty loan.....	6, 992, 927, 100
	<u>14, 977, 335, 850</u>

Balance authority under existing law for issues of Liberty bonds.....	5, 022, 664, 150
---	------------------

Authorization of issues of Victory notes.

The Victory Liberty loan act (approved Mar. 3, 1919) authorized the issue of notes of the United States not to exceed in the aggregate.. \$7, 000, 000, 000

Issues of Victory notes: Victory Liberty loan, allotted subscriptions, corrected to Sept. 30, 1919..... 4, 498, 312, 650

Balance authority under existing law for issues of notes.....	2, 501, 687, 350
---	------------------

RECAPITULATION.

Under existing authority of law there may be issued:

Bonds.....	5, 022, 664, 150
Notes.....	2, 501, 687, 350
Total.....	<u>7, 524, 351, 500</u>

ILLEGITIMATE TRAFFIC IN GOVERNMENT OBLIGATIONS.

The Treasury has been much concerned during the past year over the illegitimate and dishonest traffic in Liberty bonds and war-savings certificates and stamps. A number of unscrupulous and unpatriotic persons, by advertisements in the daily press and through personal solicitation in letters and otherwise, have purchased these securities from the owners at prices far below their market price in the case of bonds, and in the case of war-savings certificates considerably below their redemption value, and have redeemed such certificates at a profit by cashing them at post offices. The Treasury has used every means to frustrate the operations of such swindlers and has urged owners of Government securities, whenever it becomes necessary for them to part with them, to deal with reliable banks, trust companies, and others of dependable reputation, and in case of war-savings certificates to go direct to a postmaster, the only official redeeming agency.

The Treasury, with the cooperation of the Post Office Department, has also taken various steps throughout the year to meet the situation with respect to war-saving certificates and stamps. These certificates, by the terms of their issue, are not transferable. Under date of January 23, 1919, the Post Office Department issued instructions to postmasters throughout the country directing them to refuse to pay any war-savings certificates where it was apparent that changes had been made in the name of the original owner or where the certificate was presented by anyone known to be publicly buying or offering to buy war-savings stamps or certificates from the owners, unless positive evidence was submitted that the certificate presented was originally issued to the person then demanding payment.

ISSUES OF FRAUDULENT AND WORTHLESS SECURITIES.

The attention of the Congress again is invited to the necessity of enacting legislation to protect the people of the United States from grave injury growing out of the issue of securities of doubtful worth and in many cases of fraudulent character. Unscrupulous promoters, moreover, have tempted patriotic subscribers to the war obligations of the Government, particularly those who were unaccustomed to investments, to exchange Liberty bonds for their worthless stocks, causing financial loss to innocent victims and prejudicing the national finances by the resultant sale on the market of Government securities by those who have thus obtained possession of them.

The Capital Issues Committee has reported upon the subject somewhat in detail. During the war the committee was unable to reach the unpatriotic or dishonest stock vendor because of lack of power under the law to compel submission to its jurisdiction. The experience of the committee, however, has been laid before the Congress and the

Treasury has presented to the House Ways and Means Committee and to the Senate Committee on Finance a bill proposed by the Capital Issues Committee and with the general purposes of which this department is in accord. The Secretary's letter and the committee's bill are attached hereto. The importance of the enactment of legislation along these lines was emphasized by the President in his address to the Congress, August 8, 1919, on "The Cost of Living" in the following words:

May I not add that there is a bill now pending before the Congress which, if passed, would do much to stop speculation and to prevent the fraudulent methods of promotion by which our people are annually fleeced of many millions of hard-earned money? I refer to the measure proposed by the Capital Issues Committee for the control of security issues. It is a measure formulated by men who know the actual conditions of business and its adoption would serve a great and beneficent purpose.

It may be that action by the Congress alone will not suffice to suppress the evil effectually and that the problem will require supplementary legislation by the several States to reach agents who rely upon personal conversations and solicitations without the use of the mails or any other governmental agency of the United States. The Treasury respectfully urges the Congress to give consideration to this important matter, and it is earnestly hoped that such action as is necessary will be taken by the States in coordination with legislation by the Congress.

TAX EXEMPTIONS OF LIBERTY BONDS AND VICTORY NOTES.

The $4\frac{1}{2}$ per cent Victory notes are exempt, both as to principal and interest, from all taxation now or hereafter imposed by the United States, any State, or any of the possessions of the United States, or by any local taxing authority, except (a) estate or inheritance taxes, and (b) graduated additional income taxes, commonly known as surtaxes, and excess-profits and war-profits taxes, now or hereafter imposed by the United States upon the income or profits of individuals, partnerships, associations, or corporations. The $3\frac{1}{4}$ per cent Victory notes are exempt, both as to principal and interest, from all taxation (except estate or inheritance taxes) now or hereafter imposed by the United States, any State, or any of the possessions of the United States, or by any local taxing authority.

The Victory Liberty loan act also provided, in section 2, for certain further exemptions of Liberty bonds from Federal income surtaxes and profits taxes. These exemptions were in addition to the exemptions conferred by the second Liberty bond act and the supplement to the second Liberty bond act, and were designed to stabilize further the market prices of the outstanding Liberty bonds. Section 2 (a) of the Victory Liberty loan act granted an exemption up to \$30,000 in the aggregate of first Liberty loan converted 4 per cent

bonds, first Liberty loan converted $4\frac{1}{4}$ per cent bonds, first Liberty loan second converted $4\frac{1}{4}$ per cent bonds, second Liberty loan 4 per cent bonds, second Liberty loan converted $4\frac{1}{4}$ per cent bonds, third Liberty loan $4\frac{1}{4}$ per cent bonds, and fourth Liberty loan $4\frac{1}{4}$ per cent bonds, as to the interest received on and after January 1, 1919, until the expiration of five years after the termination of the war. This exemption was not made conditional upon subscription to Victory notes. Section 2 (b) granted a further exemption up to \$20,000 in the aggregate of such 4 per cent and $4\frac{1}{4}$ per cent Liberty bonds as to the interest received on and after January 1, 1919, this exemption being conditional upon original subscription to and continued holding at the date of the tax return of one-third as many notes of the Victory Liberty loan, and extending through the life of such notes of the Victory Liberty loan.

Accordingly the tax exemptions of Liberty bonds and Victory notes may now be summarized as follows:

I. Four per cent and $4\frac{1}{4}$ per cent bonds and $4\frac{1}{4}$ per cent Victory notes are exempt from all Federal, State, and local taxation, except (a) estate or inheritance taxes, and (b) Federal income surtaxes and profits taxes, as follows:

(1) First Liberty loan converted 4 per cent bonds of 1932-1947 (first 4's); (2) first Liberty loan converted $4\frac{1}{4}$ per cent bonds of 1932-1947 (first $4\frac{1}{4}$'s); (3) first Liberty loan second converted $4\frac{1}{4}$ per cent bonds of 1932-1947 (first second $4\frac{1}{4}$'s); (4) second Liberty loan 4 per cent bonds of 1927-1942 (second 4's); (5) second Liberty loan converted $4\frac{1}{4}$ per cent bonds of 1927-1942 (second $4\frac{1}{4}$'s); (6) third Liberty loan $4\frac{1}{4}$ per cent bonds of 1928 (third $4\frac{1}{4}$'s); (7) fourth Liberty loan $4\frac{1}{4}$ per cent bonds of 1933-1938 (fourth $4\frac{1}{4}$'s); and (8) Victory Liberty loan $4\frac{1}{4}$ per cent convertible gold notes of 1922-1923 ($4\frac{1}{4}$ per cent Victory notes) are exempt, both as to principal and interest, from all taxation now or hereafter imposed by the United States, any State, or any of the possessions of the United States, or by any local taxing authority, except (a) estate or inheritance taxes, and (b) graduated additional income taxes, commonly known as surtaxes, and excess-profits and war-profits taxes, now or hereafter imposed by the United States upon the income or profits of individuals, partnerships, associations, or corporations.

II. Four per cent and $4\frac{1}{4}$ per cent bonds are entitled to limited exemptions from Federal income surtaxes and profits taxes, as follows:

Four per cent and $4\frac{1}{4}$ per cent Liberty bonds (but not $4\frac{1}{4}$ per cent Victory notes) are entitled to certain limited exemptions from graduated additional income taxes, commonly known as surtaxes, and excess-profits and war-profits taxes, now or hereafter imposed by the United States, upon the income or profits of individuals, partnerships, associations, or corporations, in respect to the interest on principal amounts thereof, as follows:

1. Five thousand dollars in the aggregate of first 4's, first $4\frac{1}{4}$'s, first second $4\frac{1}{4}$'s, second 4's and $4\frac{1}{4}$'s, third $4\frac{1}{4}$'s, fourth $4\frac{1}{4}$'s, Treasury certificates, and war-savings certificates.

2. Thirty thousand dollars of first second $4\frac{1}{4}$'s, until the expiration of two years after the termination of the war.

3. Thirty thousand dollars of fourth $4\frac{1}{4}$'s, until the expiration of two years after the termination of the war.

4. Thirty thousand dollars in the aggregate of first 4's, first $4\frac{1}{4}$'s, first second $4\frac{1}{4}$'s, second 4's and $4\frac{1}{4}$'s, third $4\frac{1}{4}$'s, and fourth $4\frac{1}{4}$'s, as to the interest received on and after January 1, 1919, until the expiration of five years after the termination of the war.

5. Forty-five thousand dollars in the aggregate of first 4's, first 4½'s, second 4's and 4½'s, and third 4½'s, as to the interest received after January 1, 1918, until the expiration of two years after the termination of the war; this exemption conditional on original subscription to, and continued holding at the date of the tax return of, two-thirds as many bonds of the fourth Liberty loan.

6. Twenty thousand dollars in the aggregate of first 4's, first 4½'s, first second 4½'s, second 4's and 4½'s, third 4½'s, and fourth 4½'s, as to the interest received on and after January 1, 1919; this exemption conditional upon original subscription to, and continued holding at the date of the tax return of, one-third as many notes of the Victory Liberty loan, and extending through the life of such notes of the Victory Liberty loan.

One hundred and sixty thousand dollars total possible exemptions from Federal income surtaxes and profits taxes, subject to conditions above summarized.

III. Three and one-half per cent bonds and 3½ per cent notes are exempt from all Federal, State, and local taxation, except estate or inheritance taxes, as follows:

(1) First Liberty loan 3½ per cent bonds of 1932-1947, and (2) Victory Liberty loan 3½ per cent convertible gold notes of 1922-1923, are exempt, both as to principal and interest, from all taxation (except estate or inheritance taxes) now or hereafter imposed by the United States, any State, or any of the possessions of the United States, or by any local taxing authority.

In this connection I believe it my duty to direct your attention to the need of simplification of the limited exemptions from surtaxes and profits taxes, summarized in paragraph II above, which were conferred upon the holders of Liberty bonds by legislation enacted from time to time during the period of the war.

Of these exemptions, exemption No. 1 continues throughout the life of the various securities concerned and is not susceptible of change or consolidation with any other exemption. Exemptions No. 3 and No. 5 both continue until the expiration of two years after the termination of the war. No. 3 is unconditional, but No. 5 is conditioned on original subscription to and continued holding at the date of the tax return of two-thirds as many bonds of the fourth Liberty loan. I suggest, accordingly, that No. 3 and No. 5 be consolidated, and inasmuch as the condition which was imposed at the time exemption No. 5 was conferred has served its purpose, that that condition may now be removed in the interest of simplicity of administration, and also for the benefit of the market for Liberty bonds. Exemption No. 2 is confined to one issue of bonds which aggregates only \$3,492,050, and it can not be removed, nor be consolidated with other exemptions without grave loss to the revenue. Exemptions No. 4 and No. 6 continue, the one until the expiration of five years after the termination of the war and the other through the life of the notes of the Victory Liberty loan. No. 4 is unconditional, but No. 6 is conditioned on original subscription to and continued holding at the date of the tax return of one-third as many notes of the Victory Liberty loan. I suggest that these two exemptions be combined and that, for the reasons above given with relation to exemption No. 5, the condition be removed. This will extend somewhat the life of the \$20,000 ex-

emption, but I believe the simplicity of administration and the benefit to the market for Liberty bonds will justify the course proposed.

The only objection to these simplified arrangements which occurs to the Treasury is that they may confer upon holders of bonds who did not subscribe or hold bonds or notes as required by the acts of Congress certain exemptions from taxation which were conferred upon original subscribers. On the other hand, they take away no right which any holder has and in so far as they confer rights upon those not now holders, they will in the end benefit original subscribers who are still holders by improving the market value of their bonds or notes. It is impossible to present any accurate calculation of the consequences to the Treasury of the amendments of the law proposed. I do not hesitate, however, to express my confident judgment that the loss in revenue will be relatively slight and that the gain to the Treasury which will result from the increased attractiveness of the taxable issues of the Liberty loans and the consequent benefit to the Government's credit, as well as the simplicity of administration, will amply compensate the Treasury for that slight loss.

These simplified exemptions could be established by a statutory provision reading substantially as follows:

That in addition to the exemptions provided in section 7 of the second Liberty bond act and in subdivision (3) of section 1 of the supplement to second Liberty bond act, 4 per cent and 4½ per cent Liberty bonds shall be exempt from graduated additional income taxes, commonly known as surtaxes, and excess-profits and war-profits taxes, now or hereafter imposed by the United States, upon the income or profits of individuals, partnerships, associations, or corporations, in respect to the interest on aggregate principal amounts thereof as follows: \$125,000 aggregate principal amount thereof after January 1, 1920, and until the expiration of two years after the date of the termination of the war between the United States and the German Government, and \$50,000 aggregate principal amount thereof after the expiration of two years and until the expiration of five years after the date of the termination of the war between the United States and the German Government. The exemptions hereby conferred are not subject to the conditions and limitations respectively imposed in subdivisions (1) and (2) of section 1 of the supplement to second Liberty bond act and in section 2 of the Victory Liberty loan act, and are in lieu of and not in addition to the exemptions therein contained.

BOND AND NOTE DESIGNS.

In the preparation of the Liberty bonds and the Victory notes, involving the issuance of so many millions of pieces of war securities, every effort has been made to protect the Treasury and the public and to circumvent counterfeiting and denominational raising. The Government's established high standards of engraving and plate printing have been maintained. Color work has been introduced when appropriate and the bonds and notes have been printed on the distinctive bank-note paper adopted by the Treasury for currency issues, in which rows of red and blue silk fiber are woven during the

process of manufacture. Profiting by experience of the past with respect to currency issues, a multiplicity of designs has been avoided. Distinctive portraits have been assigned to each denomination for all issues, and following the same principle the backs of each denomination are printed in a uniform color for all issues. These distinctive features will greatly serve in preventing denominational raising. With such a vast amount of war securities outstanding, it is important that the people become thoroughly familiar with the characteristics of each issue in order that they may not be imposed upon by the unscrupulous. In general, the distinctive features appertaining to all issues of Liberty bonds and Victory notes are as follows:

Denomination.	Portrait on face of bonds.	Color of backs of bonds and coupons.
\$50	Jefferson.....	Brown.
100	Jackson.....	Orange.
500	Washington.....	Dark blue.
1,000	Lincoln.....	Green.
5,000	Monroe.....	Red.
10,000	Cleveland.....	Purple.
50,000	McKinley.....	Olive.
100,000	Grant.....	Light blue.

One exception occurs: the backs of the \$10,000 denomination of the first 3½'s, registered, are printed in brown.

CURRENCY DESIGNS.

Following the policy pursued with respect to uniform denominational designs for Liberty bonds and Victory notes, the Treasury is now undertaking to adopt a distinctive characteristic for each denomination of all forms of currency in circulation. Instructions have been issued to the Bureau of Engraving and Printing to prepare a uniform portrait that will represent each denomination of all issues of paper money. As Federal reserve notes and Federal reserve bank notes are now largely in circulation, it has been decided to adopt for all forms of currency the portraits that appear on those notes. The bureau is engaged on the work and the changes will be effected as soon as possible. This standardization will serve as a safeguard and protection against note raising, as well as in the interest of economy. It will assist bankers, business men, and the people generally in detecting attempted counterfeits, one of the most fruitful causes of which has been the absence of distinctive denominational features in the currency.

One of the greatest dangers to the Treasury and to the public in connection with the question of counterfeiting has been the multiplicity of designs of our various forms of currency. The question of revision of currency designs has been under consideration by the Treasury for many years, but it has been deemed important to take

this particular step with respect to denominational distinction without awaiting deliberation on the general subject.

The denominational portraits appearing on Federal reserve notes and Federal reserve bank notes, and which now have been prescribed for future issues of all kinds of currency, are as follows:

Denomina- tions.	Portrait.	Denomina- tions.	Portrait.
\$1	Washington.	\$100	Franklin.
2	Jefferson.	500	Marshall.
5	Lincoln.	1,000	Hamilton.
10	Jackson.	5,000	Madison.
20	Cleveland.	10,000	Chase.
50	Grant.		

THE FEDERAL RESERVE SYSTEM.

During the past year the Federal reserve system has continued to render important service by assisting the Government in its war finance operations and by enabling the banks to support the efforts of the Treasury without neglecting the interests of commerce and industry.

Between October 25, 1918, and October 31, 1919, the total of discounted bills held by the Federal reserve banks has grown from \$1,546,164,000 to \$2,128,547,000. Of the latter total, \$1,681,082,000 is represented by paper secured by Government war obligations, as against \$1,092,417,000 on the earlier date. During the period under review the Federal reserve banks, as before, very properly abstained from directly investing their funds in Government war securities. The bulk of Government securities held at present by the Federal reserve banks consists of United States bonds and 1-year 2 per cent certificates to secure Federal reserve bank-note circulation. Holdings of Government war securities proper represent almost altogether temporary purchases of Liberty bonds, Victory notes, and Treasury certificates to accommodate member and nonmember banks. No material changes in members' reserve deposits or in net deposits of the Federal reserve banks have occurred during the year, increases in these items being due largely to the accession of new members.

Federal reserve note circulation stood on October 31, 1919, at \$2,752,876,000, only slightly below the highest figure on record (\$2,753,457,000 reported for October 24, 1919), the corresponding amount for October 25, 1918, being \$2,507,912,000. The large amount of notes in circulation on both dates mentioned is due in part to the seasonal requirements for currency during the crop-moving period, while the greater amount this year compared with the preceding year reflects largely the higher price level prevailing

at the present time. During the period the Federal reserve banks' aggregate liabilities on Federal reserve bank notes in circulation increased from \$58,859,000 to \$254,933,000, this increase corresponding approximately to the amount of silver certificates of small denominations retired in accordance with the provisions of the act of April 23, 1918, known as the Pittman Act.

Gold reserves of the Federal reserve banks, which were \$2,045,132,000 on October 25, 1918, continued to increase, largely through deposits by the Treasury, and stood at \$2,201,804,000 on June 6, 1919, just before the removal by the Government of the embargo on gold exports on June 9. After that date an almost continuous decline in gold reserves is noted for a period of three months deposits by the Treasury not being sufficient to offset withdrawals for export. During the months of September and October gains in gold reserves were caused through the acquisition by the Federal reserve banks of gold received in payment for food sold by the United States Grain Corporation to the German Government. On October 31, total gold reserves were \$2,138,000,000, or about 93 millions more than on October 25, 1918.

Owing largely to the seasonal character of Government income and profits tax collections, great variation is shown in the amounts of balances carried by the Federal reserve banks on Government account, the maximum amounts occurring on the dates when large tax payments fell due. During the period under review the total Government balances ranged between 26 millions on June 6, 1919, and 286 millions on March 21, 1919, the Friday following the date when the first installment of income and excess-profits taxes fell due. The average of these balances for the period covered was 126 millions, an average somewhat lower than the corresponding average for the calendar year 1918.

Discount rates of the Federal reserve banks show but little change during the fiscal year and whatever changes occurred were parallel to changes in the rates charged on war paper. The rate on 15-day paper secured by United States war obligations early in 1918 was raised to 4 per cent, and this was the ruling rate at which the bulk of the discounts was made by most of the Federal reserve banks. The 90-day rate on war paper was maintained at $4\frac{1}{2}$ per cent, except that temporarily a 4 per cent rate was adopted to encourage the financing by the member banks of the fourth Liberty loan. Rates on ordinary commercial paper, as a rule, were fixed one-fourth to three-fourths per cent higher than the corresponding rates on war paper, with the result that since the middle of December, 1918, the share of war paper in the banks' holdings of discounted bills never fell much below 80 per cent.

A statement showing the changes for the period, November 1, 1918, to June 30, 1919, in the loans and discounts of national banks, their holdings of Government securities and their gross deposits follows:

[In thousands of dollars.]

Date.	Loans and discounts.	Government securities.	Gross deposits.
Nov. 1, 1918.....	10,096,940	3,156,312	15,051,473
Dec. 31, 1918.....	9,918,294	2,949,878	15,423,081
Mar. 4, 1919.....	9,691,187	3,681,607	15,299,807
May 12, 1919.....	9,904,821	4,028,140	15,903,796
June 30, 1919.....	10,574,838	3,171,912	15,924,865

Loans and discounts showed relatively small changes between November 1, 1918, and May 12, 1919, but increased by over 650 millions between the latter date and June 30. On the other hand, Government security holdings which had gone up from 3,156 millions on November 1, 1918, to 4,028 millions on May 12, declined to 3,172 millions on June 30, as the result largely of the redemption of Treasury certificates. Gross deposits, with the exception of the period between the last of December, 1918, and March, 1919, show a continuous growth, the total on June 30 last being about 874 millions in excess of the November, 1918, total.

WAR FINANCE CORPORATION.

With the signing of the armistice there was necessarily a narrowing of the scope of the operations of the War Finance Corporation because of the limitation of the law which restricted the advances of the corporation to "purposes necessary and contributory to the war." The corporation previously had entered into a number of engagements, however, which it was necessary to carry out in accordance with the terms agreed upon, as borrowers had made their plans in good faith, relying upon the assistance of the corporation. Among such advances were cattle loans in drouth-stricken sections of the country for the purpose of preserving the breeding herds. These loans were, as previous ones of the same character, of very great service in conserving the meat supply of the Nation.

While considerable amounts thus were advanced, a large amount of money was returned to the corporation during the year in repayment of advances, and with very few exceptions the emergency funds provided by the Government have been promptly repaid on maturity of the loans.

In line with the recommendations of the Treasury, the Congress extended the functions of the corporation with respect to financing foreign trade by the following amendment to the War Finance Corporation Act, which was incorporated in the Victory Loan act:

SEC. 21. (a) That the corporation shall be empowered and authorized, in order to promote commerce with foreign nations through the extension of credits, to make

advances upon such terms, not inconsistent with the provisions of this section, as it may prescribe, for periods not exceeding five years from the respective dates of such advances:

(1) To any person, firm, corporation, or association engaged in the business in the United States of exporting therefrom domestic products to foreign countries, if such person, firm, corporation, or association is, in the opinion of the board of directors of the corporation, unable to obtain funds upon reasonable terms through banking channels. Any such advance shall be made only for the purpose of assisting in the exportation of such products, and shall be limited in amount to not more than the contract price therefor, including insurance and carrying or transportation charges to the foreign point of destination if and to the extent that such insurance and carrying or transportation charges are payable in the United States by such exporter to domestic insurers and carriers. The rate of interest charged on any such advance shall not be less than 1 per centum per annum in excess of the rate of discount for ninety-day commercial paper prevailing at the time of such advance at the Federal reserve bank of the district in which the borrower is located; and

(2) To any bank, banker, or trust company in the United States which after this section takes effect makes an advance to any such person, firm, corporation, or association for the purpose of assisting in the exportation of such products. Any such advance shall not exceed the amount remaining unpaid of the advances made by such bank, banker, or trust company to such person, firm, corporation, or association for such purpose.

(b) The aggregate of the advances made by the corporation under this section remaining unpaid shall never at any time exceed the sum of \$1,000,000,000.

(c) Notwithstanding the limitation of section 1 the advances provided for by this section may be made until the expiration of one year after the termination of the war between the United States and the German Government as fixed by proclamation of the President. Any such advance made by the corporation shall be made upon the promissory note or notes of the borrower, with full and adequate security in each instance by indorsement, guaranty, or otherwise. The corporation shall retain power to require additional security at any time. The corporation in its discretion may upon like security extend the time of payment of any such advance through renewals, the substitution of new obligations, or otherwise, but the time for the payment of any such advance shall not be extended beyond five years from the date on which it was originally made.

During the first few months after the passage of the above amendment, loans made by the Treasury to foreign governments, the authorization of the War Department to sell its surplus stock on credit, the authority of the Food Administration to sell on credit, and special measures passed by the Congress for the relief of European nations sufficed to maintain an exceptionally high level of exports, but the time has now arrived when this new authority conferred upon the War Finance Corporation is beginning to be used in the way contemplated by the law.

Failure of the appropriation for the Railroad Administration created a sudden emergency in which the War Finance Corporation was able to be of great assistance. It was felt by the directors that this aid came well within the powers of the corporation in view of the fact that the maintenance of our transportation system for the purpose of keeping up a steady flow of supplies to American troops still in Europe and for the purpose of facilitating demobilization constituted an essential part of operations necessary and contributory to the war.

In March, 1919, the directors, facing the large requirements of the railroads, decided to issue \$200,000,000 of 1-year 5 per cent bonds of the corporation. This issue was quickly taken just prior to the issue of the Victory loan and ample funds for any emergency were thereby provided. In connection with the financing of railroad requirements, the War Finance Corporation advanced to the Director General, on proper security, \$50,000,000, and to the railroads on security of certificates of indebtedness of the Director General of Railroads \$65,094,830. The action of the War Finance Corporation not only furnished money in the sums mentioned, but made feasible the prompt and patriotic cooperation of the bankers of the country in assisting the railroads. On the assembling of the Congress, the appropriation for the railroads was promptly passed and both the Railroad Administration and the railroads repaid these emergency loans. The corporation still has outstanding loans to railroads to the extent of \$70,358,210.

The corporation has continued its function as a dealer in Government securities under section 11 of the act, and has been of great service in stabilizing the Government bond market.

After the signing of the armistice, numerous changes in the organization of the War Finance Corporation occurred. W. P. G. Harding resigned as managing director, continuing as director, and was succeeded as managing director by Eugene Meyer, jr. Clifford M. Leonard, who served as director during the war period, found it necessary on account of his health and business to resign. Sherman Allen, secretary and treasurer, resigned to enter private business, and was succeeded by R. R. Burklin. The general counsel of the corporation, George S. Franklin and Samuel W. Fordyce, jr., as well as associate counsel Frank M. Peters and Morton G. Bogue, were compelled to give up their public service to resume their private activities. M. C. Elliott was elected consulting counsel and Louis B. Wehle general counsel.

The subjoined statement shows the condition of the corporation as of November 15, 1919:

ASSETS.				
Due from depositaries:				
Treasurer of the United States.....				\$13,467,262.56
Cattle loan agency.....				1,466.41
				\$13,468,728.97
Advances under the provisions of the act:				
	Total advances.	Total repayments.	Balance outstanding.	Balance outstanding.
Section 7, paragraph 1.....	\$2,997,202.61	\$2,596,410.12		\$400,792.49
Section 7, paragraph 2.....	1,712,575.00	437,125.00		1,275,450.00
Section 8.....	550,000.00	550,000.00		
Section 9:				
Railroads.....	204,794,520.00	134,436,310.00	\$70,358,210.00	
Public utilities.....	39,661,400.00	17,124,767.85	22,536,632.15	
Warehouse receipts.....	25,211,500.00	25,211,500.00		
Industrial loans.....	23,776,152.00	22,737,500.00	1,038,652.00	
Cattle loans.....	7,779,826.13	5,074,915.28	2,704,910.85	96,638,405.00
Total.....	306,483,175.74	208,168,528.25		98,314,647.49
United States bonds and Treasury certificates of indebtedness.....				482,544,097.70
United States bonds purchased, not yet delivered.....				4,208,289.29
Public utility bonds.....				58,400.00
Accrued interest receivable on loans.....				1,174,554.00
Furniture and equipment.....				9,242.49
Total assets.....				599,777,939.94

LIABILITIES.

Capital stock paid in (authorized \$500,000,000).....		\$455,000,000.00
1-year 5 per cent gold bonds, Series A.....	\$200,000,000.00	
Less amount repurchased by corporation.....	67,807,000.00	
		132,193,000.00
Interest and sundry profits.....	17,830,069.86	
Less:		
Interest paid on 1-year 5 per cent gold bonds of the War Finance Corporation.....	\$3,873,171.40	
Accrued interest paid on United States Government obligations purchased.....	888,761.03	
Expenses of issue of 5 per cent gold bonds of the War Finance Corporation.....	233,079.23	
Administrative expenses since organization.....	250,118.26	
		5,245,129.92
Net interest and sundry profits (collected).....		12,584,939.94
Total liabilities.....		599,777,939.94

From the above statement it will be seen that the War Finance Corporation holds large amounts of the various issues of Liberty bonds as well as considerable amounts of Treasury certificates. Liquidation of the Treasury certificates at maturity and the sale of a large part of the holdings of bonds to the Treasury for its bond purchase fund will enable the corporation to liquidate its bonded indebtedness due April 1, 1920, and also to provide funds to a considerable extent for advances to foreign trade.

CAPITAL ISSUES COMMITTEE.

The Capital Issues Committee completed its work shortly after the signing of the armistice and suspended active operations on December 31, 1918. The committee rendered its final report to the Congress on February 28, 1919, and was formally dissolved by the President on August 30, 1919.

From the date of its organization on May 17, 1918, to the close of its active operations on December 31, 1918, the committee received and passed upon 3,309 applications involving new securities of an aggregate value of \$3,777,313,000. The total amount disapproved by the committee was \$917,133,000.

In passing upon issues of securities for public and private enterprises entirely from the standpoint of the national interest, the committee performed a most important function during the war and served an imperative purpose in conserving investment capital, labor, and material for the use of the Government and essential industries. The committee operated as the logical corollary of the War Finance Corporation.

The proclamation of the President dissolving the committee on August 30, 1919, and placing its records in the custody of the Federal Trade Commission was as follows:

BY THE PRESIDENT OF THE UNITED STATES OF AMERICA—A PROCLAMATION.

Whereas Congress on April 5, 1918, enacted a law known as "The war finance corporation act;" and

Whereas, under section 206 of said act, it is provided that the President may at any time by proclamation declare that the title relating to the capital issues committee is no longer necessary and that thereupon it shall cease to be in effect:

Now therefore, I, Woodrow Wilson, President of the United States, by virtue of the authority in me vested, do hereby proclaim and declare that title 2 of said war finance corporation act, relating to the capital issues committee, is no longer necessary, and I further direct that the committee shall close up its affairs, and that all the records, including letters, correspondence, and testimony in the possession of said committee be turned over to the Federal Trade Commission.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

Done this 30th day of August, in the year of our Lord 1919, and of the independence of the United States of America the one hundred and forty-fourth.

WOODROW WILSON.

By the President:

ROBERT LANSING,

Secretary of State.

GOLD.

The stock of gold money in the United States, including coin and bullion, was \$2,872,525,066 on November 1, 1919, a decrease of \$207,259,700 as compared with November 1, 1918, and an increase of \$985,254,402 as compared with August 1, 1914, or at the beginning of the war in Europe. About one-third of the world's monetary stock of gold is estimated to be held by the United States.

After the termination of the embargo on the export movement of gold on June 9, 1919, there were moderate withdrawals, which naturally reduced the monetary stock. The amount of gold money in the country on June 1, 1919, and on the first day of each succeeding month until November was as follows:

June 1, 1919.....	\$3,092,037,699	Sept. 1, 1919.....	\$2,944,727,731
July 1, 1919.....	3,026,591,090	Oct. 1, 1919.....	2,905,726,555
Aug. 1, 1919.....	2,989,548,109	Nov. 1, 1919.....	2,872,525,066

The rising cost of labor and material has rendered gold mining, not only in this country, but in all parts of the world, progressively less and less profitable during the past two years, with the result of a decreased output of gold in all parts of the world. There resulted considerable public discussion as to what steps, if any, might wisely be taken to relieve this situation. On November 2, 1918, my predecessor appointed a committee, consisting of Albert Strauss, vice-governor of the Federal Reserve Board, chairman; Edwin F. Gay, dean of the graduate school of business administration, Harvard University; Raymond T. Baker, Director of the Mint; Emmet D. Boyle, governor of Nevada; and Pope Yeatman, mining engineer, to consider and report on the subject. The conclusions reached by the committee commend themselves to me as sound and meet with my entire approval.

SILVER.

The conversion of silver dollars for use as bullion continued virtually throughout the fiscal year, the work having been completed on May 6, 1919, when the Secretary announced that he did not con-

template any further sales of silver under the act of April 23, 1918, generally known as the Pittman Act, except to the Director of the Mint.

Over 191,000,000 standard silver dollars were melted during the year. That amount, together with the dollars melted in the preceding fiscal year, enabled the Treasury to complete the arrangement entered into in May, 1918, with the British Government for the shipment to India of 200,000,000 fine ounces of silver resulting from the melting of silver dollars under the authority of the Pittman Act.

The following tables show various operations under that act from the date of its passage to October 31, 1919:

TABLE I.—*Silver dollars melted.*

Dollars melted (whereof \$3,177,554 represented dollars in Treasury and the balance was made available by the retirement of silver certificates)	\$260, 121, 554
--	-----------------

TABLE II.—*Silver certificates withdrawn from circulation and canceled.*

Denominations.	Amount net.
\$1	\$112, 718, 265
\$2	35, 624, 260
\$5	92, 960, 115
\$10	6, 956, 820
\$20	6, 396, 340
\$50	2, 262, 400
\$100	24, 300
\$500	1, 500
Total face value	256, 944, 000

TABLE III.—*Federal reserve bank notes issued Apr. 30, 1918, to Oct. 31, 1919.*

	Net issue.
\$1	\$174, 241, 436
\$2	46, 624, 364
\$5	34, 170, 435
\$10	1, 608, 910
\$20	1, 254, 700
Total	257, 899, 845
Less notes redeemed but not assorted by denominations	1, 656, 000
Notes outstanding October 31, 1919	256, 243, 845

The Federal reserve bank notes which have been issued, as stated in the above table, are secured as follows:

United States loan of 1925, 4 per cent.	\$1, 768, 000
United States consols of 1930, 2 per cent.	4, 523, 100
United States Panama loan 1916, 2 per cent.	130, 300
United States Panama loan 1918, 2 per cent.	258, 000
Special certificates of indebtedness, 2 per cent.	255, 475, 000
Total	262, 154, 400

The announcement of May 6, 1919, coupled with the removal on that day of all restrictions on the export of silver, more fully discussed elsewhere in this report under the heading "The International Financial Situation," had the effect of freeing the silver market from the control of war measures. The market price of silver in the New York market has since fluctuated as follows:

Maximum and minimum prices of silver, by months, since May 6, 1919.

	Maximum.	Minimum.		Maximum.	Minimum.
May.....	\$1.215	\$1.0125	August.....	\$1.1675	\$1.0825
June.....	1.1425	1.085	September.....	1.2125	1.12
July.....	1.09375	1.035	October.....	1.2575	1.1725

PUBLIC MONEYS AND SPECIAL DEPOSITARIES.

The Treasury continued throughout the year the policy of depositing proceeds from Liberty loan subscriptions and purchases of certificates of indebtedness in incorporated banks and trust companies designated by the Secretary as special depositaries for the purpose. Any incorporated bank or trust company is eligible for such special designation in accordance with the provisions of Department Circular No. 92, as amended and supplemented, April 17, 1919 (Exhibit 71, page 432). The entire receipts from Liberty loan subscriptions and certificate sales during the fiscal year 1919 were deposited with special depositaries, the Federal reserve banks, branch Federal reserve banks, and the Treasurer of the United States.

At the beginning of the fiscal year 1919 there were 6,510 special depositaries and at the close of the year there were 9,550, of which 4,511 were national banks and 5,039 State banks and trust companies. Both national and State banks were designated as such depositaries in every State in the Union.

The amount of Government deposits in these depositaries on June 30, 1919, was \$905,397,000, and on October 31, 1919, \$422,776,000. These special deposits, like deposits in the regular depositaries for Government funds, paid the Treasury interest at the rate of 2 per cent per annum. The amount of interest received from such depositaries for the fiscal year 1919 was \$20,996,202.36, while the amount of interest received from this source from the date of the creation of the special depositaries in the early part of the war to June 30, 1919, was \$31,921,081.82, as shown by the following table:

Interest collected to June 30, 1919, by Federal reserve districts, on deposits in special depositories on account of sales of Liberty bonds, Victory notes, and certificates of indebtedness and income and profits tax payments under acts of Apr. 24, 1917, Sept. 24, 1917, Apr. 4, 1918, Sept. 24, 1918, July 9, 1918, and Mar. 3, 1919.

Federal reserve district.	April 24 to June 30, 1917.	July 1 to Dec. 31, 1917.	Jan. 1 to June 30, 1918.	July 1 to Dec. 31, 1918.	Jan. 1 to June 30, 1919.	Total.
Boston.....	\$5,340.47	\$495,044.28	\$757,345.98	\$1,138,915.47	\$733,867.20	\$3,130,513.40

New Orleans branch.....		28,332.71	60,320.38	79,005.33	88,140.55	253,798.97
Total.....	358,221.43	4,142,794.84	6,423,863.19	12,644,323.82	8,351,878.54	31,921,081.82

The necessity for depositing income and profits taxes in special depository banks during the fiscal year 1919 was obviated by two factors:

(1) Such taxes were permitted by law to be paid in four quarterly installments instead of having to be made in one payment as heretofore.

(2) Treasury certificates of indebtedness receivable in payment of income and profits taxes were sold in advance to taxpayers. By this method the financial problem had adjusted itself before the taxes were due and no shifting of large sums of money resulted.

By Department Circular No. 144 collectors of internal revenue are required to deposit their entire receipts in Federal reserve banks or branch banks where such banks are located in the headquarters city of the collector. Where the collector is not located in a Federal reserve or branch Federal reserve city, he deposits cash and checks drawn on local banks (other than checks received exclusively in payment of income and profits taxes in the months of March, June, September, and December) with local national bank depositories. All out-of-town checks (and checks in payment of income and profits taxes in the months of March, June, September, and December) are forwarded to the Federal reserve bank or a branch of the Federal reserve bank in the district in which the collector's office is located. This use of the collection system of the Federal reserve banks permits the Treasury to obtain earlier credit for checks received in payment of internal-revenue taxes and obviates the necessity of maintaining larger public balances in depository banks to enable them to carry the float resulting from the immediate credit to the Government's account of the amount of the great number of checks received on account of taxes.

UNITED STATES DEPOSITARIES IN FOREIGN COUNTRIES.

Depositaries of public moneys of the United States were appointed in Belgium during the fiscal year 1919, and in addition the Treasury continued such depositaries in France, Great Britain, Italy, Spain, Switzerland, Argentina, and Canada. These depositaries were designated under the authority vested in the Secretary of the Treasury by section 8 of the act of September 24, 1917, as amended. They were of great service to disbursing officers of the Government, particularly those of the Army and Navy, in making prompt payments and transacting public business in foreign countries.

PAYMENT OF SPANISH-AMERICAN WAR BONDS.

Additional bonds of the 3 per cent loan of 1908-1918, popularly known as the Spanish-American war loan, which matured and ceased to bear interest on August 1, 1918, were presented to the Treasury for payment during the fiscal year 1919. On the date of maturity there were \$63,945,460 of these bonds outstanding. During the first month after maturity \$55,414,960, of the securities were presented for payment. Other amounts have been presented from time to time until on June 30, 1919, \$936,000 were outstanding, and on October 1, 1919, \$858,600 were outstanding. Thus during the period of the creation of a new war debt—the greatest in the history of America—the debt remaining from the last previous war in which the United States was engaged has been virtually extinguished. While the amount is relatively small when measured by the standards of these record-breaking days, its payment, particularly in the circumstances, reflects the policy of the United States in promptly discharging its obligations.

BOND-SECURED CIRCULATION OF THE NATIONAL BANKS.

The situation with respect to operations under section 18 of the Federal reserve act in connection with the retirement of bond-secured circulation of the national banks and the refunding of 2 per cent bonds bearing the circulation privilege into one-year 3 per cent Treasury notes and 30-year 3 per cent bonds remained unchanged throughout the fiscal year 1919. Owing to the demands for currency, applications from member banks for the sale of bonds securing circulation were negligible and no 2 per cent bonds bearing the circulation privilege were retired during the year. It should be pointed out, however, that the amount of bonds available for securing circulation was reduced during the year by \$63,945,460 by reason of the maturity of the Spanish-American war 3 per cent bonds which became due and payable on August 1, 1918.

On January 1, 1919, the balance of \$9,301,000 one-year 3 per cent Treasury notes then outstanding matured, were paid, and the option held for their renewal was not exercised by the Secretary. With this payment the total amount of one-year 3 per cent Treasury notes, aggregating \$27,362,000, issued under section 18 of the Federal reserve act in lieu of retired 2 per cent bonds having the circulation privilege has been retired and no longer appears as an item of the public debt.

United States bonds bearing the circulation privilege were outstanding on October 31, 1919, as follows:

4 per cent loan of 1925.....	\$118, 489, 900
2 per cent consols of 1930.....	599, 724, 050
2 per cent Panamas of 1916-1936.....	48, 954, 180
2 per cent Panamas of 1918-1938.....	25, 947, 400
	793, 115, 530

The amount of national bank circulation secured by United States bonds on October 31, 1919, was \$722,394,325, as compared with \$721,471,138 on October 31, 1918.

FUNDS FOR ARMY PAYMENTS IN EUROPE.

The method of providing Army payments in Europe, which was outlined in the report for the fiscal year 1918, has been continued up to the present time. This plan has greatly facilitated payments to United States troops in Europe and the settlement of other Government obligations incurred in foreign countries.

Minor modifications of the original scheme have been made to meet changing conditions abroad, such, for instance, as the transfer from Paris to Washington, toward the end of the fiscal year, of the auditing of the accounts of disbursing officers in the military establishment. Under the provisions of the Army payment plan, the cash balance maintained in France has been available to pay the checks of any disbursing officer of the Army located in that country; likewise, the cash balance maintained in England has been available to pay checks of any Army disbursing officer located in that country. It has not been necessary to carry a balance for the credit of each officer and under each appropriation. This method has greatly reduced the amount of cash balances in foreign countries required to finance the Army. It has been of great assistance to the Treasury in reducing the constant drain on the general fund. Since the Government has had to borrow money to meet its current expenditures, the reduction of transfers from the general fund results in the saving of interest charges. Much has been saved in that direction and experience has fully justified the value of the Army payment plan.

AUDIT OF ACCOUNTS ABROAD.

The general purposes of section 12 of the act of September 24, 1917, providing for the audit of the accounts of the military establishment abroad, were fulfilled during the fiscal year. The audit was authorized by law not only to facilitate the operations of disbursing officers of the military forces but also to avoid the necessity of shipping each month from Europe the originals of vouchers and pay rolls, thus subjecting them to the danger of loss by submarines and other war perils. Because of the progress made in the demobilization of the Army the Assistant Auditor for the War Department abroad was recalled just prior to June 30, 1919, and the work carried on at Paris by that office is now being performed by a division, established for the purpose, in the office of Auditor for the War Department at Washington.

It was thought advisable to continue the office of the assistant comptroller in Paris after the recall of the auditor's force until such time as disbursements by the military establishment abroad should be reduced materially. It was believed that Army disbursing officers would be assisted and many erroneous payments prevented by continuing the facilities accorded them of obtaining advance decisions on proposed payments and such similar assistance as could be rendered by the office. This view has been justified by subsequent events and in addition the services of the assistant comptroller in Paris have been utilized in connection with financial transactions under the direction of the Secretary of the Treasury, such as the daily transmission to the Treasury Department of a statement of receipts, disbursements, and balances reported by the French Treasury, the supervision over indemnity bonds and issuance of duplicate checks where disbursing officers' checks have been lost, and other miscellaneous work of the department. After the close of the fiscal year 1919 the assistant comptroller's office in Paris was directed to close up its work about October 1, and the employees of that office were directed to return to Washington.

The accounts of disbursing officers, with the vouchers and papers connected therewith, filed with the assistant auditor in Paris, were shipped to Washington in June, 1919. These accounts contain the original pay rolls and vouchers covering the disbursements of the Army during the entire period of our participation in the fighting in Europe. Through the cooperation of the War Department in arranging for the transportation, these papers, filling several freight cars, were received in Washington promptly and safely. Their value historically and in adjusting the pay due soldiers, living and dead, as well as in settling claims of all kinds, is apparent. They will be needed as original evidence for many years.

A BUDGET SYSTEM.

For many years the question of a budget system has been discussed by the country in a rather desultory and disinterested manner. Secretaries of the Treasury have earnestly recommended the creation of a budgetary plan under which the Government's outgo would be properly related to its income along the lines of intelligent and scientific control and responsibility. The time when this question might be considered from a purely academic point of view as to what is desirable as an improvement has now passed. The compelling force of necessity has arrived. There has been a wholesome public discussion of the matter in recent months, accompanied by an increasing realization on the part of the public of the imperative need of budgetary reform. The large expense involved in the aftermath of the war, the interest and sinking-fund charges on the public debt, and the growth of the Government leave no room for doubt that we shall never return to the prewar standard of expenditures. The cost of running the Government of this great Nation will mount into huge sums, which will be increased as additional burdens upon the taxpayers of the country by every element of duplicated effort, waste and inefficiency. There can be no question or argument now as to the necessity of a budget system, and the people of the country, aroused to the needs of the situation, will sooner or later insist upon the adoption of an effective plan, for the answer to inaction is increased taxation.

The Treasury is pleased to note that the Congress already is giving careful consideration to this important question and has been glad of the opportunity to present its views. That there should be one single authority responsible for the preparation and execution of the Government's program of finance and that appropriations should be made not independently of each other but with reference to one single comprehensive plan of expenditure properly related to the Government's income there can be no doubt. The burden of preparing the budget must, in the nature of the case, if the work is to be properly done and responsibility centered instead of divided, rest upon the Executive. The supervision of the preparation of the budget should be vested in the Secretary of the Treasury, who is the chief fiscal officer of the Government and, as such, should be the representative of the President in budgetary control. The budget, as thus prepared for the President and on his responsibility, should not, as such, be increased by the Congress, and the department has ventured to express the opinion that appropriations should be considered by a single committee of the House of Representatives and the Senate. As a further step in the plan, unquestionably the audit system should be reformed by the consolidation of the offices of the Comptroller of

the Treasury and the Auditors of the Treasury into one central organization, to which would be transferred the present duties and powers of the comptroller and the auditors, with the added authority to examine into and make report upon the methods employed and the results obtained by the executive departments of the Government. Such reports should be submitted to the Congress and to the Secretary of the Treasury.

Some sincere advocates of a budgetary system, in their enthusiasm to see the movement started and believing that it is not possible to obtain a reasonably complete plan in the beginning, have suggested that the reform be accomplished by gradual stages. With that view the Treasury does not agree, because such a program undoubtedly would retard rather than accelerate true budgetary reform. All movements of change proceed slowly and gradually through a period of discussion, but when the time for action arrives they must take effective form if they are to succeed. Modification of the present system will not be a budget simply because it is called a budget. An effective plan must deal with the three fundamental aspects of the problem, namely, the centering of responsibility in the Executive, the exercise of self control in the Congress and the consolidation and expansion of the audit system. Any other plan would be misleading to the country and only result in the postponement of the desired reform.

REVOLVING FUNDS AND REIMBURSEMENTS OF APPROPRIATIONS.

The necessity during the period of war emergency of providing greater freedom of administrative action involving the use of public moneys has been recognized by the Congress in various ways. The expedient of appropriating for so-called "revolving funds" has come into existence and from time to time there has been repeated the practice which finds ample precedent in the past of authorizing specific appropriations to be reimbursed by moneys received from the sales of Government property and supplies, or otherwise, so as to renew or increase the amounts originally appropriated. The device of appropriating for revolving funds developed during the war, while that of providing for the reimbursement of appropriations is of long standing. They are essentially the same in principle. Such measures doubtless were necessary in the cases in which they were employed during the crisis of war, when it was desirable to grant wide discretion and extensive powers in order to permit the largest effort to be devoted to the supreme task of defeating the enemy.

Now that the war emergency has passed, the Treasury desires to invite the attention of the Congress to the grave menace to the con-

trol of appropriations and to the finances of the Government involved in any extension of appropriations of this character, or even of their continuance, unless in clearly exceptional cases. By such appropriations the revenues of the Government affected never become unconditionally available to meet general expenditures, but are appropriated automatically for special purposes without further control by the Congress and without any new consideration of the merits of the additional expenditure. These appropriations by their very nature tend to produce expenditures which, if considered anew, might not be authorized by the Congress, and I believe that their discontinuance, to the utmost limit possible, is an essential condition of any program for rigid economy in Government expenditure. To appropriate receipts accruing to the Government in this manner for special purposes takes the money just as truly out of the Treasury as if directly appropriated in specific sums, but at the same time conceals the real extent of the appropriation involved. I feel very strongly that, in general, the receipts of the Government should be covered into the Treasury unconditionally without being affected by any special trust or purpose, and that, so far as may be, expenditures of the Government should be made pursuant to direct appropriation of the Congress.

While revolving funds and the like may be regarded as emergency measures growing out of war needs and not likely of repetition under ordinary conditions, it is thought advisable to bring the subject to the attention of the Congress at this time because of the tendency to seek administrative liberty of action with relation to public moneys, without the usual Treasury supervision. The disposition of administrative officers is to acquire as wide discretionary control over appropriations for their departments or establishments as the Congress will permit, and every recognition by the Congress of the need of such administrative control in specific cases is accepted as an argument for further and similar grants of authority. The discretionary power allowed over expenditures from specific or annual appropriations, in ordinary circumstances, is not a matter which concerns the Treasury except in the routine discharge of the statutory duties of its officers. But the grant from the Treasury of a revolving fund with or without qualifications or limitations as to its use, or the increase of appropriations by so-called reimbursements, creates a situation that is indefinite and uncertain both from the viewpoint of the Congress and of the Treasury.

In addition, it is pertinent to point out that appropriations of this character present large and important accounting difficulties in that they bring into Government affairs features somewhat unfamiliar in the accepted scheme of accountability to the Treasury, and which,

furthermore, are not wholly in keeping with the permanent statutory requirements from which the intent of the Congress with reference to appropriations and accounting for public moneys has hitherto been drawn. The general intent of the Congress with reference to the use of appropriations and the accountability of responsible officers to the Treasury for all moneys received by them for the use of the United States from any sources whatever are well settled. Moreover, the appropriation acts themselves usually contain a statement of intent by means of limiting clauses or provisos which serve as guides to Treasury administration. The intent of the words "revolving fund" in appropriation acts, however, is not always apparent, and resort is necessarily had to construction in the light of acknowledged principles as applied to the objects to be accomplished. The difficulties are not all of interpretation from an accounting viewpoint. There remains a large field of transactions based upon the revolving-fund principle over which the Treasury has no opportunity of exercising supervision. This loophole in fiscal control permits large expenditures without adequate accountability and makes difficult the application of proper administrative measures in relation to the basic specific appropriation itself. The provisions for an accounting and the disposition of revenues, for example, appear to relate solely to final balances and not to the transactions leading up to them. The whole revolving-fund principle is out of harmony with the permanent legislation that has heretofore safeguarded the use of public moneys, and makes difficult the fulfillment of the statutory duties imposed upon the Treasury. It was justifiable only in the emergency of war.

Mention also should be made of the statistical difficulties encountered in connection with such appropriations. Under the law and in accordance with long-established custom, receipts which are covered into the Treasury as reimbursements of appropriations, and likewise receipts that are credited to revolving funds, do not appear as receipts on the daily and other financial statements of the Government, but they are deducted from the expenditures. This is an undesirable procedure. The law should require that such moneys be deposited in the Treasury as receipts of the Government.

These manifestations of present-day tendencies show a serious departure from the orderly procedure with respect to appropriations, and the subject is commended in its relation to the Treasury as one worthy of careful consideration with the hope that, with the passing of the war emergency, the Congress will not permit the extension of these principles but will meet the needs of all Government agencies, as far as possible, by definite appropriations with the requirement that all receipts accruing to the United States from whatever source shall

be covered into the Treasury for the general purposes of the Government.

INCORPORATED GOVERNMENT AGENCIES.

The subject of incorporated Government agencies is closely related in its importance to the Treasury to that of appropriation for revolving funds and reimbursable appropriations. This means of handling some large and unusual activities of the Government was necessary during the war, but, now that the emergency has passed, there can be no justification, generally speaking, for the creation of new Government-owned corporations or the continuation of those in existence except in unusual cases or for the purpose of winding up their affairs. At the least, such agencies should not be exempted from amenability in future to the accounting laws of the United States and the regulations of the Treasury made in pursuance to the statutes unless good and controlling reasons are given therefor. The particular advantage (which I should rather call menace in time of peace) accruing to Government functions so organized, is the freedom which they enjoy in the expenditure of public money without the legal restrictions that the Congress has imposed with respect to the usual transactions of the Government. If these activities were sustained by specific appropriations and were required to withdraw their funds from the Treasury in the manner prescribed for other Government establishments with the same accountability both as to disbursements and receipts, there would be little or no ground for the corporate form of organization.

Attention has been called particularly to this recent innovation among the instrumentalities of Government by reason of the requirement of the Congress by act of July 1, 1918, long after operations had been undertaken along commercial lines without regard to Treasury accountability, that the Secretary of the Treasury should assume the responsibility of an audit of the financial transactions of the United States Shipping Board Emergency Fleet Corporation, under such rules and regulations as he should prescribe. It is almost needless to say that a task of that nature imposed at so late a day is well-nigh impossible of fulfillment with any marked degree of satisfaction.

Authorization given by the Congress empowered the corporation to control certain specific appropriations and account for them to its own board of management and in such reports as are required to be made to the Congress. The congressional appropriations were not disbursed, therefore, through a disbursing officer and charged to him on the books of the Treasury as in ordinary circumstances, but were given to the corporation on settlements made by a Treasury

auditor as moneys due and paid on settlement warrants, for which there is no accounting to the Treasury. The action of the Treasury in this respect was in accord with law and with the evident purpose of the Congress in having the specific appropriations made from public funds spent as the money of any corporation would be spent, without reference to the laws limiting and restricting the use of moneys by the regular departments and establishments of the Government. Under such conditions vast sums have been handled as earnings and as expenditures without regard to their character as public moneys and without the restraining application of the Treasury regulations which have been brought into being by reason of the legal requirements and restrictions surrounding the Government's financial transactions in ordinary circumstances.

A mere glance at the situation occupied by these incorporated agencies under private control and at their manifest weaknesses when compared with government-controlled agencies or with business corporations not connected with the Government will bring conviction that the device is not a happy one for the Government's finances or a satisfactory one to the managers charged with responsibility for their economical administration. This is due not alone to the inherent difference of men and methods, trained under different systems and evolved from different schools of efficiency, but also to a difference in the view taken of the objects to be accomplished. Government officers charged with administrative achievement are charged at the same time with obedience to restrictions placed upon the use of appropriated funds, and the object of their endeavors is thus made twofold. A proper regard for the interests of the public treasury is not the least of their duties. The officers of a private corporation seeking its own ends find the object of their efforts in the accumulation of business profits, unrestrained by any other law, as a rule, than is to be found in penal legislation. But the objective of business profits is in itself a restraint and a guide to their actions and, above all, a check on extravagant expenditures and on inefficiency. The corporation created and utilized as a Government agency, however, operating on a capital for which it has no accountability and which has been drawn from the public treasury with a prospect of further access to public funds in time of need, whether the need shall arise from successful expansion or wasteful expenditure, has none of these restraints; and its objective may depart ever so far from congressional intent without a test or any standard by which its full accomplishment or failure may be measured. These concerns become, primarily, spending agencies without the restrictions and obligations imposed by law upon Government establishments or those imposed by invested capital upon private corporations which are to be tested

by profits earned. They stand alone, therefore, without tests or standards; without regulations or responsibility imposed by Government authority or by individual holders of their securities; and without other guaranty of integrity and efficiency than may be derived from the selection of their officers, who may be given an arbitrary power over their affairs.

Other cases than the Emergency Fleet Corporation could be cited as typical of the anomalous position of such incorporated agencies with respect to the Treasury; but it is thought that the difficulties of safeguarding the public interests and carrying out the statutory intent with respect to the public funds must be obvious from a mere statement of their character. But for the somewhat prevailing tendency to make commercial methods applicable to Government transactions there is little or no excuse for excepting such agencies, now that the war emergency has passed, from the usual requirements and restrictions built up on the experience of many years and preserved by legislative enactment for general application to the financial transactions of the Government.

It is undeniable that government has come to mean very largely a scientific business organization operating for the benefit of the public. Its operations must be based on efficient handling of public finances for the benefit of those in whose interest the machine is run or else it is a failure with respect to those interests. In this sense its operations have a direct bearing on the living cost and the material welfare of the individual. In no respect is this direct connection between the public treasury and the welfare of the individual more advantageously manifested than in the economies and safeguards and efficiencies which should surround the business activities of the Government.

There are very substantial grounds to be found in experience for the view that strictly governmental establishments are oftener than not administered more efficiently than many business concerns that are frequently pointed out as models for the business of government, and that government methods are more effective for the purposes of government than are the methods employed by private corporations. Certainly it would seem that the time has come when the use of revolving funds and the employment as governmental agencies of chartered corporations operating under individual personal control, and all similar devices, are no longer justified by emergency needs. They inherently contain possibilities of extravagant methods of accomplishing results which might be accomplished better and more economically by means of the tried and tested machinery distinctively governmental in character and operation.

The experience of the Treasury confirms the view that the so-called red tape of government in accounting can be shown upon fair analysis to be but an orderly procedure of safeguards and checks, easily followed by one who has a proper regard for the interests of the public, and presenting no obstacles to business efficiency except to those who have an interest to serve by promoting a certain laxity of administration. And nothing promotes so rapidly an atmosphere of laxity as a removal of the legislative restraints long and zealously imposed by the Congress with respect to appropriations from the public funds or a weakening of the established requirement that public moneys shall be deposited in the public treasury and withdrawn only in consequence of legislative authorization.

With reference to the public funds, the consideration by the Congress of the use of incorporated agencies as instrumentalities of government is urged.

CHECKING ACCOUNTS OF GOVERNMENT CORPORATIONS AND THE RAILROAD ADMINISTRATION CARRIED BY THE TREASURER.

The United States Shipping Board Emergency Fleet Corporation, the United States Housing Corporation, the War Finance Corporation, and the United States Food Administration Grain Corporation have continued to maintain checking balances with the Treasurer of the United States, as outlined in the previous annual report of the Secretary of the Treasury.

The total amount of the checks drawn on the Treasurer by the United States Shipping Board Emergency Fleet Corporation which have been paid from February 28, 1918, when the balances of that corporation were transferred to the Treasurer, to October 31, 1919, was \$4,331,872,379.71. The total balances on deposit with the Treasurer on October 31, held for credit of the disbursing agents of the corporation, amounted to \$208,332,821.86.

The total amount of the checks drawn on the Treasurer by the United States Housing Corporation which have been paid from July 27, 1918, when the checking credit was established on the books of the Treasurer for the corporation, to October 31, 1919, was \$123,696,668.98. The total balances on deposit with the Treasurer on October 31, held for credit of disbursing agents of the corporation, amounted to \$4,557,892.25.

The total amount of checks drawn on the Treasurer by the War Finance Corporation which have been paid from June 2, 1918, when the checking credit was established on the books of the Treasurer for the corporation, to October 31, 1919, was \$1,454,988,813.34. The total amount of balances on deposit with the Treasurer on October 31, held for credit of the War Finance Corporation, was \$28,165,824.59.

The United States Food Administration Grain Corporation has not used the Treasurer's office to the same extent as the other Government-owned corporations enumerated above. The total checks paid by the Treasurer from October 31, 1918, when the first credit was established for the Grain Corporation, to October 31, 1919, was \$436,200,000. The total amount of balances on deposit with the Treasurer on October 31, held for credit of the corporation, was \$177,290,209.70.

In addition to the above, the Russian bureau of the War Trade Board and the Railroad Administration maintained checking accounts with the Treasurer of the United States. The total amount of checks drawn on the Treasurer by the Russian bureau of the War Trade Board which have been paid from November 30, 1918, when the checking account was established on the books of the Treasurer for the corporation, to October 31, 1919, was \$11,639,-807.69. The total amount of balances on deposit with the Treasurer on October 31, held for the credit of the Russian Bureau of the War Trade Board, was \$1,048,987.03.

The total amount of checks drawn on the Treasurer by the Railroad Administration, which have been paid from April 13, 1918, when the first checking account was established on the books of the Treasurer for the Railroad Administration, to October 31, 1919, was \$1,313,977,605.60. The total amount of balances on deposit with the Treasurer on October 31, held for the credit of disbursing agents of the Railroad Administration, was \$17,373,159.60.

Pursuant to the request of the Director General of Railroads, the Treasurer of the United States was designated as his agency for the payment of the principal and interest of the certificates of indebtedness issued by the Director General of Railroads on account of compensation for the possession, use, control, and operation of railroads and systems of transportation under Federal control; for motive power, cars, or other necessary equipment, or parts thereof, or material or supplies therefor, furnished to the director general for use on or in connection with the operation or utilization of the property of railroads and systems of transportation under Federal control; and for the purchase or construction of boats, barges, tugs, and other transportation facilities furnished to the director general for use on or in connection with the operation or utilization of the property of railroads and systems of transportation and of inland, canal, and coastwise waterways under Federal control.

The Treasurer has paid these certificates of indebtedness directly and through the Federal reserve banks. The holders of the certificates were notified that payment of principal and interest, to July 15, 1919, inclusive, would be made at the Treasury in Washing-

ton, or, at the option of the holders of the certificates, at the Federal reserve banks.

To make payment of these certificates the treasurer of the Railroad Administration established a credit of \$288,526,150.13 with the Treasurer of the United States. The payments made by the Treasurer of the United States from July 15, 1919, to September 30, 1919, amounted to \$288,399,222.46.

The total amount of payments which have been made by the Treasurer for the above-named Government-owned corporations and the Railroad Administration up to and including October 31, 1919, were \$7,960,774,497.78.

The plans evolved by the Treasury for handling the accounts and disbursements of these agencies of the Government have been operated to the entire satisfaction of all concerned. The funds have been assured absolute security and appropriated moneys running into large amounts have not been withdrawn from the Treasury until needed to pay obligations of the Government, thus reducing the amount of Government borrowings with the consequent saving in interest charges.

SALARIES OF GOVERNMENT OFFICERS AND EMPLOYEES.

It is earnestly to be hoped that the Congress will give careful consideration to the question of salaries in the public service. While in the light of experience I can speak only for the Treasury, undoubtedly the same problem respecting personnel that confronts this department obtains in the other great Government establishments in Washington. The largely multiplied business of the Government can not be conducted with efficiency and economy unless there be attracted to and retained in the public service a group of highly trained, well paid, and permanent officials of supervisory grades. Uncertainty of tenure in some instances and inadequacy of compensation have closed the public service to many men of the best type or forced them out of Government employ at the moment of their greatest usefulness. The war has increased the public debt more than twenty-five fold and has augmented the functions and activities of the Government in many ways. The duties are greater and the responsibilities are larger than those of other days, to the standards of which it is not to be expected that the Government will ever return. The conditions are such that failure to take the necessary action to invite and hold in the public service men of exceptional ability and of real distinction in their fields can result only in grave burdens to the taxpayers of the country and in possible disaster.

Already the transaction of the business of the Government is hampered by deficiencies of personnel due to the return to private life of many men of large capacity who, during the period of active warfare, were willing and glad to serve their country at great personal sacrifice. I have come to learn that there are heroes in the civil establishments as well as in the military services, self-sacrificing patriots who toil year in and year out for a bare pittance when they could command salaries double or treble the amounts they receive from the Government, but who for the love of their country and for the love of their work have rejected alluring offers in the field of private enterprise. They were too fine and too patriotic to leave their posts at a time when their services were indispensable. Under the compelling force of patriotism they made willing sacrifices during the war, but with the return of peace, the Government can not expect to retain these employees indefinitely, because in justice to themselves and their families they will sooner or later accept the larger opportunities that are open to them in the world of business and industry unless the Government proposes to pay them salaries that at least reasonably approach the value of their services.

Only prompt action by the Congress to build up a permanent and dignified civil service which will include men of great ability and high attainments can prevent mistakes and failures in the transaction of the public business, the consequences of which may be calamitous. This does not mean a wholesale increase in the Government pay roll but such reclassification, new positions and increased salaries as may be necessary to obtain and hold employees of the character so imperatively needed in the interest of economy, efficiency and safety. The Congress has already taken a step in this direction by the creation of the Joint Commission on the Reclassification of Salaries, and it is to be hoped that that body will find the solution of the pressing problem of compensation in a plan that will grant a living wage to all employees commensurate with their relative value to the Government and afford salaries that are comparable with those paid to men and women in private enterprise.

RETIREMENT OF CIVIL-SERVICE EMPLOYEES.

The logical corollary of the necessity for adequate salaries for the personnel of the Government is the imperative need of an equitable retirement law for civil-service employees. Economy and efficiency in the public service and justice to faithful employees who have toiled through the best years of their lives in the interest of the Government require that provision be made for the retirement of those who are superannuated or disabled. Previous Secretaries of

the Treasury have urged the passage of such an effective retirement law, and to their recommendations I give my hearty indorsement.

In this connection attention is invited to the proposal of Secretary McAdoo that the Congress, in framing a retirement measure, consider the possibilities of an expansion of the principles underlying war-risk insurance. I agree with my predecessor that the solution of the problem lies along the lines of insurance with both the Government and the civil employees contributing to a scientific plan that will provide for retirement as well as insurance against death.

FEDERAL FARM-LOAN SYSTEM.

The Federal farm-loan system has operated effectively and successfully during the past year, amply justifying the great purpose for which it was created and meeting the expectations of its advocates. The Federal land banks have continued to make loans to farmers at $5\frac{1}{2}$ per cent per annum, and the joint stock land banks at 6 per cent. All loans, as provided by the act, have been made on the amortization plan, the borrower making a fixed payment, annually or semiannually, which is at least 1 per cent in excess of the interest charge, such excess being applied on the principal. As the balance of the principal due decreases the proportion of this level payment absorbed by the interest charge correspondingly decreases and a constantly increasing balance is applicable to the extinguishment of the debt. This principle, while familiar to actuaries and statisticians, had not been applied in this country to individual mortgages to any appreciable extent prior to the enactment of the Federal farm-loan act in July, 1916. The great success of the farm-loan system has called attention to the advantages of this method of paying debts, and the application of the amortization plan to all mortgages, urban and rural, is now being actively urged by influential private organizations.

During the 12 months ended September 30, 1919, loans were made by the Federal land banks to the farmers of the United States to the aggregate amount of \$129,271,662, an increase of \$10,742,839 over the corresponding period a year ago, and making a total of loans by the Federal land banks from the inception of the system in March, 1917, of \$261,175,346. The subjoined table indicates the amount of the loans made by each of the banks in the years referred to and in the aggregate:

District.	Federal land bank.	Loans made Oct. 1, 1917, to Sept. 30, 1918.	Loans made Oct. 1, 1918, to Sept. 30, 1919.	Aggregate of loans made from date of or- ganization in March, 1917, to Sept. 30, 1919.
1	Springfield, Mass.....	\$4,999,630	\$4,738,200	\$9,913,545
2	Baltimore, Md.....	4,323,150	5,277,550	10,401,000
3	Columbia, S. C.....	6,198,905	7,361,150	13,891,045
4	Louisville, Ky.....	7,490,700	9,460,700	17,959,900
5	New Orleans, La.....	8,800,135	8,722,715	18,192,505
6	St. Louis, Mo.....	8,166,065	12,149,270	20,895,940
7	St. Paul, Minn.....	17,380,500	14,886,100	33,605,900
8	Omaha, Nebr.....	14,418,050	20,267,450	35,390,290
9	Wichita, Kans.....	10,292,922	9,045,000	23,311,800
10	Houston, Tex.....	11,264,287	16,885,787	28,666,561
11	Berkeley, Calif.....	7,315,800	6,019,400	14,065,400
12	Spokane, Wash.....	17,878,679	14,458,340	34,880,860
	Total.....	118,528,823	129,271,662	261,175,346

There have been 27 joint stock land banks incorporated by private capital under the terms of the act, with aggregate capital of \$8,500,000. Nineteen of these banks were incorporated during the past year, and therefore can not be said to be, as yet, in full and active operation. The loans made by the joint stock land banks aggregate \$41,787,359, which added to the loans of the Federal land banks makes a total of \$302,962,705 lent to farmers by all of the banks composing the system. The banks of this character have grown very strikingly in number and in volume of business during the past year. Owing to the fact that they were not established until after the Federal land banks, and that for some time there were only a few in operation, their loans represent only 14 per cent of the total, but during one or more recent months they have transacted as high as 30 per cent of the whole volume of business of the system. Notwithstanding this division of the field, the Federal land banks have done a larger volume of more desirable business than in the previous year, the membership of existing farm-loan associations has grown, and over 600 new associations have been organized.

A very gratifying feature of the year is the remarkable improvement in the financial position of the Federal land banks. During the first year of their existence, and part of the second year, they necessarily operated at a loss. This was inevitable, and was anticipated by the proponents of the system and those who were familiar with the business. The 12 banks opened in the spring of 1917 with an aggregate capital of \$9,000,000, of which \$8,892,130 was subscribed by the Government and \$107,870 by individuals. Before the close of the first year over \$600,000 of this original capital had been absorbed by the excess of organization and current expenses over the scanty receipts of that period. By January 31, 1919, this amount had been

made good out of earnings. Under the provision of the Federal farm-loan act that after subscriptions to capital stock by farm-loan associations shall amount to \$750,000 in any Federal land bank, one-fourth of all sums thereafter subscribed shall be applied to the payment and retirement of the stock originally subscribed, eight of the banks had, up to November 15, 1919, paid and retired \$1,198,890 of the stock originally subscribed by the Government, thereby reducing the amount of stock held by the Government on that date to \$7,693,240. Notwithstanding such retirement of stock originally subscribed, the aggregate capital stock of the 12 banks increased from \$9,000,000 at the start to \$21,321,687 on November 15, 1919.

Up to October 31, 1919, the net earnings of the 12 banks amounted to \$1,278,394.41, of which \$202,175 had been carried to reserve account, \$332,923.98 distributed in dividends paid by five banks upon stock owned by farm-loan associations and individuals, and \$743,295.43 is still carried as undivided profits.

Another gratifying feature, testifying alike to the security of the loans made, the ability and willingness of borrowers to make payment, and the efficiency of the collection machinery of the banks, is the unusually small total of delinquencies. To September 30, 1919, payments due by borrowers to the banks had accrued to the amount of \$12,666,313.61. Of this sum the amount remaining unpaid on that date was only \$172,456.72, or 1.4 per cent of the total. Of that amount \$86,816.60 was 30 days or less overdue, \$25,182.05 from 30 to 60 days, \$14,872.85 from 60 to 90 days, and only \$45,585.22 over 90 days overdue. This record has been made notwithstanding widespread disaster to crops in several sections of the country.

The Federal farm-loan act provides that "the salaries and expenses of the Federal farm loan board and the farm loan registrars and examiners * * * shall be paid by the United States." The system is now so well established and is in such financial condition that this assistance from the Government, in the judgment of the Federal farm loan board, concurred in by officers of the banks, is no longer necessary or desirable. The board accordingly has recommended that beginning with the fiscal year 1921 its expenses be provided for by assessments against the Federal land banks and the joint stock land banks in proportion to their gross assets. Measures for this purpose have been introduced in both houses of the Congress and, should the plan be adopted, the Government will be relieved entirely from the payment of the expenses involved. To have put the system on such a basis in three years is a very gratifying and satisfactory result.

The primary purpose of the Federal farm-loan system, as expressed in the title of the act creating it, was "to provide capital for agricul-

tural development." The accomplishment of that purpose necessarily involved the possibility of an enhancement of farm-land values. In so far as such enhancement was based upon increased production or added attraction to farm life, it was legitimate and desirable. Indeed, there were many sections of the country where, owing either to the exodus of young men from the farms to industrial pursuits in the towns, or to local and peculiar conditions, farm lands were selling at prices much below their intrinsic value as measured by productive capacity. Any enhancement in land values in these sections which might incidentally result from the operation of the Federal farm-loan system was a general public benefit, as tending to check the urban drift of population and stimulate the local production of foodstuffs. The Federal Farm Loan Board has had in view from the start, however, the importance of guarding the system from complicity in anything approaching speculation in farm lands or such enhancement in their value as would either make them more difficult for men of small means to acquire or add to the overhead cost of producing foodstuffs. The high prices realized by growers for their crops during the war period were naturally reflected in a general increase in land values, but the first indication of any rapid or speculative rise did not manifest itself until a few months ago, when it appeared in some sections of the Middle West. It was claimed, perhaps correctly, in a recent convention of private loaning agencies, that the advances in this section were justified and will be permanent. The Federal Farm Loan Board, however, has thought that in the public interest, and in pursuance of the policy of conservatism which they have always followed, it would be better to follow this movement at a safe distance than to be part of it. They, therefore, issued instructions under date of May 3, 1919, to the banks under their supervision that where sales had taken place within a year at prices materially in excess of previous values such sales were not to be taken into account in the appraisement of the land, and under date of July 7, 1919, that no loans in excess of \$100 an acre were to be made on land used for general agricultural purposes, even where the appraisement was \$300 or \$400 an acre.

SEED-GRAIN LOANS TO FARMERS.

The administration of the seed-grain loans made to farmers in drouth-stricken areas from the sum of \$5,000,000 placed at the joint disposal of the Treasury Department and the Department of Agriculture by the President from the fund appropriated for the national security and defense has progressed steadily during the past year. The nature and scope of this plan as announced in Joint Circular No. 1, dated August 2, 1918, of the Treasury Department and the

Department of Agriculture is outlined in the Annual Report of the Secretary of the Treasury for 1918, pages 107-109. Joint Circular No. 1 made provision for loans to farmers for the fall planting in 1918 only, but subsequently further advances were authorized, while several modifications in the administration of the loans became necessary to meet new and changed conditions.

In the autumn of 1918 a scourge of grasshoppers occurred in certain sections of Kansas shortly after the fall planting in those sections had been completed. The crops of many of the farmers who had received advances from the Government were entirely destroyed by this scourge, and these farmers would have been unable to replant their land that fall had not the Government again extended relief to them. In department telegram dated November 20, 1918, to the president of the Federal land bank of Wichita, the Treasury Department, with the concurrence of the Department of Agriculture, authorized the Federal land bank of Wichita to make additional seed-grain loans for fall planting. These second fall planting loans were made upon substantially similar terms as the first fall planting loans. They were limited, however, to those farmers whose acreage had been planted by means of the first loans and whose crops had been completely destroyed by grasshoppers, a fact to be evidenced by a certificate of an agent of the Department of Agriculture. The maximum loan to any farmer was limited to an amount not to exceed \$150, nor greater than \$1.50 per acre, and a separate guaranty fund was created distinct from the first fall planting guaranty fund. It was provided, however, that any surplus in the second fall planting guaranty fund after the payment of losses should be paid into the first fall planting guaranty fund. These second fall planting loans were not made to farmers in the St. Paul and Spokane districts, as the grasshopper scourge appeared only in certain sections of Kansas.

At about the same time that these second fall planting loans were authorized, a circular entitled "Joint Circular No. 2," dated November 1, 1918, prescribing "Regulations relative to farmers' seed-grain loans for spring wheat planting in 1919 in drouth-stricken areas" was issued by the Treasury Department and the Department of Agriculture. This circular authorized loans for spring wheat planting to farmers who had suffered two successive crop failures through drouth or winter-killing, and in other respects created a plan substantially similar to the plan under which the fall planting loans were made. No farmer who had received loans for the purpose of fall planting could take advantage of these spring planting loans unless the acreage sown by means of the fall planting advances was less than 100 acres, and then only upon an acreage not to

exceed the difference between the acreage which the farmer had planted by means of a former loan and 100 acres. The maximum loan to any farmer was limited to an amount not to exceed \$500 nor greater than \$5 per acre. A guaranty fund was created distinct from the first and second fall planting guaranty funds and it was provided that any balance in such fund remaining after payments had been made on the notes of the farmers whose crops had proved a failure should be applied to reimburse any deficiency existing in the first and second fall planting guaranty funds. Loans for spring wheat planting were made only in the Spokane and St. Paul districts.

In the spring of 1919 representations were made to the Treasury Department and to the Department of Agriculture that in some instances the crops planted in the fall of 1918 by means of Government advances had been totally destroyed by winter-killing or other causes, or so nearly so as to render the crops failures under the provisions of Joint Circular No. 1. In order that such land might not lie idle, and to assist the farmers concerned in obtaining funds for their support, as well as for the liquidation of their indebtedness to the Government, a circular entitled "Joint Circular No. 3," dated March 20, 1919, prescribing "Regulations relative to farmers' seed-grain loans in drouth-stricken areas in the matter of determining crop failure for the purpose of replanting" was issued by the Treasury Department and the Department of Agriculture. Under this circular a farmer whose crop had been destroyed could apply for permission to plow up his land and plant other crops. Before this permission was given, however, and to prevent the destruction of a crop which might justify harvesting, an agent of the Department of Agriculture must make investigation and render to the land bank a certificate of failure. This certificate must show that the stand remaining would not produce 5 bushels or more per acre under good conditions, and that the land would be immediately planted to other crops. Upon receipt and approval by the bank of this certificate of failure the farmer was allowed to plow up his land.

It being customary in certain sections of the Southwest to insure growing crops against hail, the Federal land bank of Wichita in March, 1919, suggested the advisability of insuring the crops of farmers who had received advances from the Government. After a conference of the representatives of the Treasury Department and the Department of Agriculture, the Federal Farm Loan Board was instructed to advise the Federal land bank of Wichita to take the necessary steps to insure the crops in that section, with the understanding, however, that the lien of an insurance company on such a crop would be subject to the lien of the Government. Following this advice, the Federal land bank of Wichita took out a blanket policy of insurance against hail of \$4 per acre on crops planted by means of Government ad-

vances. It was agreed, however, that if a farmer preferred to take out insurance of his own accord, he might do so, provided the policy was made payable to the Federal land bank or was deposited with that institution. Losses by hail having occurred, a circular entitled "Joint Circular No. 4," dated September 2, 1919, prescribed "Supplemental regulations relative to farmers' seed grain loans in drouth-stricken areas covering the matter of insurance of crops" was issued by the Treasury Department and the Department of Agriculture. This circular prescribed the rules and regulations governing the rights and liabilities of farmers whose crops were insured against hail or other casualty, and subsequently destroyed through such causes. It provided that the Federal land bank as financial agent of the United States should apply whatever insurance money it might receive to the payment of the farmer's indebtedness. The balance, if any, must then be returned to the farmer, who would not be required to contribute to the guaranty fund, and who would not be entitled to receive the benefits thereof unless the insurance money was insufficient to cover his indebtedness. It is still too early to determine the exact amount which the Government will realize through these insurance policies, but it is safe to say that by securing this insurance the respective guaranty funds will be relieved to a considerable extent, for the indebtedness of many farmers whose crops were destroyed by hail will be satisfied out of the insurance money instead of by payments from the guaranty funds, thus making the pro rata payments applied on the indebtedness of farmers whose crops have failed through other causes materially greater.

During the summer of 1919 it developed that where a crop would probably not yield more than 4 bushels per acre, an amount which would barely pay the reasonable cost of harvesting, thrashing, and marketing, the farmer would leave his land and go elsewhere to labor for wages unless he were permitted to receive the proceeds of his crop for the immediate sustenance of himself and family. By letters dated August 13, 1919, to the Federal land bank of Spokane, and September 10, 1919, to the Federal land banks of St. Paul and Wichita, signed by the Secretary of the Treasury and the Secretary of Agriculture, the Federal land banks were authorized to release the Government's lien on a crop on the receipt of a certificate from an agent of the Department of Agriculture that the crop had not yielded more than 4 bushels per acre, that the yield was not more than sufficient to pay the reasonable expense of harvesting, thrashing, and marketing, and that the proceeds were necessary to the immediate support of the farmer and his family. The release of this lien, of course, did not cancel the borrower's obligation on his note.

By virtue of loans actually made and completed under the seed-grain plan, a total of 1,137,810 acres were planted according to reports from the Federal land banks. As these loans were made only to farmers who had exhausted their resources and were without commercial basis for credit, this acreage would otherwise have remained uncultivated in large part if not entirely. The total acreage sown as reported by the several Federal land banks is as follows:

State.	Acres.
Kansas.....	312,594
Oklahoma.....	229,589
Texas.....	84,230
New Mexico.....	4,947
North Dakota.....	81,893
Montana.....	421,617
Washington.....	2,940
Total.....	1,137,810

The loans were made to 15,688 farmers, the amount aggregating \$4,200,838. Of this sum the Federal land bank of Wichita made loans for first fall planting to 8,198 farmers, amounting to \$1,873,749; and for second fall planting to 204 farmers, amounting to \$18,596. The Federal land bank of Spokane made loans for fall planting to 1,287 farmers, amounting to \$259,285; and for spring planting to 4,862 farmers, amounting to \$1,690,649. The Federal land bank of St. Paul made loans for fall planting to 271 farmers, amounting to \$51,982; and for spring planting to 866 farmers, amounting to \$306,577.

This general plan enabled more than 15,000 farmers to carry on their farming operations which otherwise would have been abandoned. Without some such agency as the Federal land banks through which these loans were administered as financial agents of the Government, the work could never have been done; and the prompt and satisfactory manner in which this large volume of extraneous business was carried on without disturbing the daily routine of these banks is a substantial testimonial to the efficiency of their organization. The Federal land bank of Spokane was charged with the service in Washington and Montana; that of St. Paul with North Dakota; and that of Wichita with Kansas, New Mexico, Oklahoma, and Texas.

In Oklahoma and Texas and a portion of the Kansas district farmers who have received loans have been favored with abundant harvests and will be able not only to pay their individual indebtedness but also to make substantial contributions to the respective guaranty funds. In portions of Kansas unfavorable weather conditions and the devastation by grasshoppers resulted in a greatly reduced yield—in most cases amounting to a total failure as defined

in the plan; while unprecedented droughts in the plateau region of Montana, and North Dakota resulted in almost complete failure in those sections. Receipts in payment of these seed-grain loans are now coming in, but it is impossible definitely to forecast the result. The success or failure of the plan does not, however, rest upon the financial result, but upon the efficiency of the method employed in extending aid to farmers to tide them over a period of unprecedented agricultural conditions, and with a view to increasing the food supply of the Nation during an emergency and to add to the national security and defense. In view of the acreage sown under this general plan, which otherwise would have been abandoned in large part at least, it may properly be said that the purpose of the seed-grain loans has been well and fully accomplished.

BUREAU OF INTERNAL REVENUE.¹

For nearly eight months of the fiscal year 1919 the Bureau of Internal Revenue was under the necessity of operating in accordance with the provisions of the act of 1917, although during the greater part of that time there was pending in the Congress a bill intended to produce greatly increased revenues and providing for material alterations in the existing system of taxation. While the collection of the various monthly taxes and the work of auditing and adjusting income and other taxes arising under previous legislation was carried forward energetically, the bureau was chiefly occupied during this time with the expansion and improvement of its organization and with other preparations for the administration of the war-revenue act of 1918, which became effective finally on February 24, 1919. Less than three weeks in advance of March 15, the date set for the filing of income and profits tax returns and the payment of the first quarterly installment of these taxes under the new law, the bureau was under the necessity of promulgating regulations and distributing forms for the use of millions of taxpayers throughout the United States. This emergent undertaking was satisfactorily performed through the expedient of issuing and authorizing the use of tentative forms of return on which the liability to tax, if not definitely ascertainable by March 15, might be estimated to the best of the knowledge and belief of the taxpayer. The filing on March 15 of more than 4,000,000 returns and the payment on that date of more than \$1,000,000,000 demonstrated the willingness of virtually all citizens

¹ The figures concerning internal-revenue receipts as given in this chapter differ from such figures carried in other statements showing the financial condition of the Government because the former represent collections by internal-revenue officers throughout the country, whereas the latter represent the deposit of these collections in the Treasury or depositaries during the fiscal year concerned, the differences being due to the fact that some of the collections in the latter part of the fiscal year can not be deposited, or are not reported to the Treasury as deposited, until after June 30, thus carrying them into the following fiscal year as recorded in the statements showing the condition of the Treasury.

to respond promptly, even under the most adverse conditions of administration, to the obligations imposed on them on account of the war-revenue requirements of the Government.

It was estimated that the Revenue Act of 1918 would produce, in the first 12 months, about \$6,000,000,000 of revenue. It appears from the assessments made on the basis of income and profits tax returns filed on March 15, 1919, for the taxable year 1918 that the amount of the estimate will be realized. As a result of the statutory provision authorizing the payment of income and profits taxes in four quarterly installments falling due March 15, June 15, September 15, and December 15, approximately one-half of such taxes assessed in the fiscal year 1919 will be paid in the fiscal year 1920. The actual collections for the fiscal year ended June 30, 1919, including only two of the four installments of income and profits tax payments, amounted to \$3,839,950,612.05, as compared with \$3,694,619,638.72 collected in the fiscal year 1918, including the payment in full of income and profits taxes under the Revenue Act of 1917—an increase of \$145,330,973.33. Reports already received of payments of the third installment of income and profits taxes indicate that with the fourth installment due December 15, receipts from all other sources of revenue provided by the act of 1918, and delinquent and additional income and profits taxes, the aggregate collections during the first 12 months of operation under the new act will closely approach the original estimate of \$6,000,000,000.

Although the delay in the passage of the Revenue Act of 1918 appears not to have resulted in any serious diminution of the revenue, delay in the adjustment of difficult cases of tax liability has been unavoidable, and the audit and verification of taxpayers' returns and claims are not as far advanced at this time as would have been the case had the provisions of the law been available for the information and study of taxpayers and administrative officers at an earlier date. In many thousands of cases it has been necessary, in fairness to taxpayers, to permit extensions of time for the filing of final returns. This in turn has delayed consideration by the Bureau of Internal Revenue of the cases concerned, although the installments due on the estimated amount of tax had in each case been paid.

The benefits accruing to the Government and the taxpayer through the organization of a group of representative business and professional men and a special unit of expert accountants, auditors, etc., for service in the administration of the first war revenue act led to the creation of an Advisory Tax Board by the Revenue Act of 1918. This board was organized March 13, 1919, and was composed of five highly trained and experienced men, including an economist, an accountant, a lawyer, a manufacturer, and a former deputy commissioner of internal revenue. During the first few

months of operation under the new law the board rendered invaluable service in the formulation of regulations and in hearing appeals of taxpayers as well as in advising the income-tax unit of the Bureau of Internal Revenue in the disposition of involved technical cases. By October 1, 1919, fundamental and controlling questions had been determined and regulations and decisions had been constructed to the point of permitting the discontinuance of the board, the duties of which have since been assumed by a special group of tax experts, lawyers, and accountants who have had wide experience and training in the bureau, especially in connection with the operations of the Advisory Tax Board.

Material changes in the statutory bases of internal taxation made it necessary in the administration of the first war-revenue act to effect important changes in the organization of the bureau at Washington. The development of this policy has led to a similar reorganization of the field force. The 64 collection districts have been readjusted so that each State in the Union, with the exception of Nevada, which for the present is embraced in the northern district of California, constitutes at least one collection district, and, with the exception noted, the boundaries of all collection districts now follow State lines. Two or more separate districts have been continued in States where the service seemed to require such arrangement for the time being without necessitating undue duplication of supervisory work, although it is probable that the number of districts eventually will be reduced. In this readjustment 10 new collection districts were established for the States of Maine, Vermont, Rhode Island, Delaware, Mississippi, North Dakota, Wyoming, Idaho, Utah, and Arizona, and the following 10 districts were discontinued: The second, sixth, seventh, and eighth of Kentucky; the seventh of Indiana; the fifth and thirteenth of Illinois; the first of Wisconsin; the ninth of Pennsylvania; and the fifth of North Carolina. The territory formerly embraced within the abolished districts has been added to the jurisdiction of other established districts of the same States. The reorganization of the field service was accomplished through Executive orders signed by the President on June 27, July 19, and July 29, 1919, and the changes became effective August 1, 1919.

As an important part of the reorganization of the field service, branch offices for the transaction of the various forms of internal-revenue business and for furnishing advice and assistance to taxpayers have been established at important points throughout several of the collection districts, and it will be the policy to develop this plan so as to place the tax-service facilities of the Government within convenient reach of every taxpayer. Eventually, it is intended

that every principal city and town will have a branch office operated under the direction of the several collectors of internal revenue.

The special methods of selecting and training employees in the technical work of the Internal Revenue Service which were worked out in considerable detail in the bureau at Washington during the preceding year have been carried into the field. The consequent improvement in the field personnel has permitted the bureau to take an important step toward the decentralization of a large amount of work which in the first year under the new tax laws was handled entirely at Washington. Income-tax returns of less than \$5,000 filed in the fiscal year 1919 were left in the offices of collectors to be audited and adjusted through conferences with taxpayers. As rapidly as is consistent with uniform and accurate disposition of cases, the handling of additional classes of claims and cases will be assigned to the field officers to relieve the congestion of work at Washington and to expedite the collection of additional taxes due, as well as the payment of refunds to taxpayers. A special effort has been made to impress on field officers the importance of uniform courtesy and impartiality in dealing with all taxpayers, so that the transactions of the bureau with the public may be maintained on a businesslike and equitable basis.

The legal and accounting force engaged in the administration of the income and profits tax laws and the audit and verification of nearly 7,000,000 returns received under the acts of 1917 and 1918 has been built up rapidly during the past year. Relatively large additions also have been made to the personnel of those units of the Bureau of Internal Revenue which have immediate supervision of the administration of the laws relating to taxes on estates, commodities, luxuries, and child labor. The force at Washington now numbers 4,088 as compared with 1,367 at the beginning of the year. The income-tax unit, which handles the most important subject matter in the bureau, has been successful in increasing materially the rate of finished cases, both those involving the assessment of additional taxes and those involving the refund of amounts erroneously collected as taxes.

Employers of labor throughout the country have cooperated generally with the Bureau of Internal Revenue in the enforcement of the provisions of the new revenue law imposing a tax of 10 per cent on the net income of certain kinds of business employing child labor. The disposition of employers has been to observe the standard set up in the law by which tax liability may not be incurred and the revenue officers have met with little difficulty in securing the evidences of age which are required by the law to establish exemption from tax. This tax became effective only on April 25, 1919, and no employers have as

yet been found to have subjected themselves to the assessment and collection of the tax provided.

Under the provisions of the Harrison antinarcotic law, providing for the registration and taxability of persons authorized to dispense or sell certain habit-forming narcotic drugs, vigorous efforts have been continued to apprehend and bring to justice persons guilty of engaging in the illicit traffic in these drugs. The number of revenue agents and inspectors specially trained in this line of work has been increased and a considerable number of convictions have been secured. During the year final report was made by the committee appointed to investigate this subject for the department. The wide prevalence of narcotic drug addiction in many parts of the country, as well as the inadequacy of the facilities provided for the rescue and rehabilitation of addicts, is shown by the report. The Revenue Act of 1918 amended the Harrison antinarcotic law in several important respects. Provision was included for the separate classification and registration of persons handling narcotic drugs in the various stages of importation, manufacture, prescription, and distribution, making possible more effective measures for securing information from those persons and enforcing the observance of the law. A tax of 1 cent per ounce is also imposed on the commodity itself, the payment of which is to be evidenced by the affixing of a stamp in such manner as to seal the stopper or covering. The result of this measure is to identify drugs which have passed through the legitimate trade and those which have been procured through the widespread illicit traffic in narcotic drugs. On the authority of Supreme Court decisions rendered during the year, a Treasury decision was issued defining the responsibility of physicians and druggists in dispensing and distributing narcotic drugs. The result of the issuance of this decision, which makes clear the illegality of prescribing or dispensing to habitual users any quantity of narcotic drugs except in the course of legitimate treatment to cure the habit, has been to cut off from thousands of addicts their accustomed sources of supply. Many of these persons are without funds to enter private institutions for the cure of narcotic drug habits and have been reduced to a pitiable condition in which they constitute a serious menace to many communities. Accordingly, to meet this situation the department has recommended to the Congress the enactment of legislation which will put the Public Health Service in a position to undertake the care and treatment of these unfortunates and restore them to a normal condition.

Such a measure is now pending and its early enactment is urgently recommended. The comparative ease with which narcotic drugs may be concealed and smuggled into this country from abroad makes highly desirable some international agreement by which the narcotic

drug trade of the world may be regulated and controlled. Such an agreement is provided in the proposed constitution of the League of Nations, which sets up authority to perfect the ratification of the Hague Opium Convention.

Such police functions as have hitherto been assigned for execution to the Bureau of Internal Revenue have been, in form at least, taxation measures, and it was the judgment of the department that the enforcement of prohibition, which is essentially unrelated both in form and substance to taxation, should not be added to the already onerous responsibilities of this bureau. The Congress, however, having regard to the activities of revenue officers leading to the apprehension and conviction of violators of the laws imposing taxes on the manufacture and sale of alcoholic beverages, has provided by recent enactment for the enforcement of prohibition through the agency of the Bureau of Internal Revenue. To avoid confusion and inefficiency in the administration of the tax laws and of the prohibition measure, it is proposed to organize separately within the bureau a special unit to carry on the prohibition work. Revenue officers of experience in this line of work and no longer needed for the performance of duties in connection with taxes on the prohibited commodities, if qualified for the new work, will be transferred to the supervision of this unit, and sufficient additional force will be provided to carry on a vigorous program in every State. With the expected cooperation of all law-abiding citizens and of State and municipal peace officers, the observance of this law will be energetically sought through both the dissemination of information and prosecution of offenders.

Synthetic glycerin formula.

The termination of military operations in November 1918, made it unnecessary to continue the special project of the chemical laboratory of the Bureau of Internal Revenue for the promotion of the synthetic manufacture of glycerin from the fermentation of molasses according to the formula which had been worked out by the laboratory, as stated in the preceding annual report of the Secretary of the Treasury. This formula, however, which had engaged the attention of a considerable staff of chemists for a period of three months, may have considerable commercial value, as it permits the complete recovery of the raw material in the form of alcohol and potash, as well as glycerin. The formula has therefore been made available to any manufacturers who may be interested.

WAR RISK INSURANCE.

The Bureau of War Risk Insurance, created barely five years ago, has developed from a small beginning into the largest single unit in the Government service, conducting within itself four separate

businesses, each of which is comparable with the greatest of their kind in the field of private enterprise. The records on September 30, 1919, show:

1. A marine and seamen's insurance department—	
Having done a total business of.....	\$2,390,080,236.54
With premiums collected amounting to.....	47,592,510.61
Having issued 33,384 policies and paid claims to the extent of.....	28,737,146.47
With a surplus over expenses and refunds of.....	17,124,903.84
2. A stupendous banking business for the dependents of men in the service making monthly payments of allotments and family allowances by the Government on 2,057,842 awards during the period of a year and a half exceeding.....	
	531,000,000.00
3. An employers' liability department—	
Now making payments each month on claims for military and naval compensation to the extent of.....	2,754,836.13
Having paid burial expenses amounting to.....	1,834,763.33
4. A life insurance department—	
Having written during the period of one year and a half 4,561,974 individual policies representing a total amount of insurance of.....	39,817,391,500.00
With premiums between Oct. 6, 1917, and Sept. 30, 1919, of approximately.....	315,000,000.00
With claims payable to the extent of.....	1,042,457,673.48

During the fiscal year 1919 the character of the bureau's functions was vastly changed from that of the previous year. On June 30, 1918, the United States was engaged in active warfare and the bureau was receiving daily thousands of applications for insurance, was issuing monthly over a million checks for allotments and family allowances to the dependents of men in the service, and was conducting a vast war-risk insurance business on American vessels, their cargoes, and the lives of their crews. In the fiscal year 1918 the bureau had received comparatively few insurance claims and very few men had been discharged from the military service, so that the investigation of claims for payment of military and naval compensation was not extensive. During the first four months of the fiscal year 1919 the bureau had practically the same conditions to face as during the previous fiscal year with the exception that, as the casualties in the service had become heavier, it became necessary to make plans for the prompt payment of claims for insurance and for military and naval compensation.

But with the signing of the armistice on November 11, 1918, the whole machinery of operation had to be reversed. The bureau ceased to issue marine and seamen's insurance as the risks of war disappeared. Men were discharged from military service and allotments and family allowances which theretofore had gone to their dependents had to be stopped, and the insurance which had been issued on the lives of men in the Army and Navy had to be treated

in an individual way rather than in group. During the war, insurance premiums were deducted from the pay of soldiers, sailors, and marines, but after discharge the men were required to pay their premiums direct to the bureau; therefore it was necessary to set up all the accounting records, notify the men of the date premiums were due, and keep them informed of their privileges under the war-risk insurance act.

As the disabled men were discharged from the military service and filed claims for compensation, the bureau had to make investigations to determine whether they were eligible for the payment of compensation as defined in the act, and make arrangements for their medical treatment and hospitalization, if necessary.

These changes somewhat revolutionized the work of the bureau and constituted a task of very great magnitude.

Organization.

The bureau is now organized in 13 divisions, viz, Insurance Division, Compensation and Claims Division, Actuarial Division, Legal Division, Finance Division, Medical Division, Allotment and Allowance Division, Receipts and Disbursements Division, Liaison Division, Marine and Seamen's Division, Personnel Division, Chief Clerk, and Administration Division.

The Insurance Division controls all the records pertaining to military and naval insurance, including the administration of the work of converting the term insurance policies into the permanent forms of United States Government life insurance. This division keeps a record of the date of discharge of every insured man and of all premium payments made after discharge. It also administers the insurance feature of the soldiers' and sailors' civil relief act. The Compensation and Claims Division receives both death and disability claims for compensation and insurance, obtains the necessary proofs, and makes awards thereon. The Actuarial Division performs the actuarial work of the bureau, prepares statistical reports on insurance and on compensation and insurance claims, and has established work report units in other divisions of the bureau. The Legal Division is the law office of the bureau, and in this division there is also a section which controls the licensing of foreign insurance companies in accordance with the "trading with the enemy act." The Finance Division has charge of the bookkeeping and financial matters of the bureau. The Medical Division is advisory to the Compensation and Claims Division, and through it the Public Health Service provides treatment for disabled men entitled thereto. The Allotment and Allowance Division attends to all matters pertaining to allotments and family allowances. The Receipts and Disbursements Division

sends out all checks for compensation and insurance claims as well as allotments and family allowances. The Liaison Division is the contact division of the bureau and has charge of the publication of all official rulings and bulletins of information and instruction. The Marine and Seamen's Division has charge of insurance on vessels and cargoes and on the lives of seamen in the merchant marine. The Personnel Division makes all appointments and keeps the personnel records of the bureau. The Chief Clerk and the Administration Division have charge of mails, supplies, messengers, and general office work.

The personnel of the bureau increased from 6,703 on July 1, 1918, to 13,771 on July 1, 1919. To obtain this net increase of 7,068 employees it was necessary to make 11,796 appointments. Such a labor turnover means a tremendous expenditure of time and money, due to the period of training which every new employee must undergo. With the reestablishment of more settled conditions in Washington and throughout the country as a whole, it is expected that the rate of turnover will be lessened, the service of the bureau correspondingly improved, and the expenses decreased. The large increase in personnel has been necessary because of the temporary increase in the work due to the demobilization of the military and naval forces, despite the fact that many installations of labor-saving mechanical devices have been made. Of the men at present employed in the bureau, 47 per cent are ex-service men.

In February the first units moved into the new 11-story War Risk Building. By the end of September the number of buildings occupied by the bureau was reduced from 16 to 4. The new building is not large enough, and it is necessary to keep certain divisions in other buildings. At the present time it is planned to consolidate the Insurance Division in the War Risk Building and to place in outlying buildings divisions which are not so large as to prevent lodgment in a single building. The Insurance Division is now housed in four different buildings in widely scattered sections of the city.

Marine and seamen's insurance.

Under the act of September 2, 1914, insurance against war risk was provided for vessels and their cargoes, and under the amendment of June 12, 1917, protection was granted to masters and crews against loss of life, injury, and detention. The writing of marine insurance dates from September 28, 1914, while the first seamen's insurance policy was issued July 3, 1917. The rates for both types of policies were withdrawn on January 4, 1919. There remains only the settlement of unadjusted claims. It was possible to terminate the business of this insurance so soon after the signing of the armistice because protection was provided against the war hazard only.

Marine insurance—Insurance of hulls, cargoes, and freights, Sept. 2, 1914, to Sept. 30, 1919.

Total losses, including estimated unrepresented claims.....	\$307, 077. 81

Military and naval allotments and family allowances.

Article II of the war-risk insurance act authorizes the bureau to award allowances to the families and to the dependents of enlisted men in the Military and Naval establishments of the United States, provided a monthly allotment of \$15 is made from the pay of the men. All enlisted men in the service were required either to make application for an allowance, which was compulsory for a man having a wife, children, or a former wife divorced and not remarried to whom alimony had been decreed; or to file a statement requesting that no allowance be awarded, which was optional with a man having only dependent parents, brothers, sisters, grandchildren or grandparents. A great many requests for exemption from the compulsory allotment were filed and were granted by the bureau when proper cause was shown.

The allotment and allowance problem during the past year was completely reversed with the signing of the armistice. The Army and Navy sent discharge notices which furnished data enabling the bureau to terminate the allotments and allowances. However, instead of the entire case being closed when a man was discharged, many cases required more attention than if the men had remained in the service. A very large percentage of the men discharged, who had made allotments to their families and who were entitled to allowances, began immediately to correspond with the bureau, making protests regarding the amounts of money received by their dependent relatives and advising the bureau as to what amounts, in their opinions, should have been paid. As a result there has been an enormous amount of correspondence in adjusting and terminating these cases.

Applications and awards for family allowances for the period Oct. 6, 1917, to June 30, 1919.

Applications received.....	4, 391, 094

Amount of allotments paid.....	\$267, 955, 981
Amount of allowances paid.....	\$233, 167, 009

Military and naval compensation.

Compensation for death or for disability incurred while in the military or naval service is payable to a man or his dependents upon the presentation and approval of proofs, provided disability or death was the result of the man's performance of duty and not the result of his own misconduct.

Article III of the war-risk insurance act specifies the amounts of the military and naval compensation benefits. For example, a widow alone receives \$25 per month; a widow with one child, \$35; a totally disabled man with neither wife nor child, \$30; a totally disabled man with wife alone, \$45; and a man losing both feet, both hands, both eyes, or who becomes totally blind, or helpless and permanently bed-ridden, \$100 per month. When the disability is other than total, the degree of disability is determined and the award made on a percentage basis; for example, a man 50 per cent disabled having a wife, would receive \$22.50 per month. The basis for permanent, partial disability at the present time is \$30 per month for a single man. Thus a man who has lost a leg is entitled to from 40 to 70 per cent of \$30 per month. It is hoped that the proposal changing the basis to \$100 per month will become a law.

During the fiscal year 1919 the bureau practically completed the work arising from claims for military and naval compensation because of death. After the armistice and the discharge from the service of the wounded and sick, the number of disability claims increased very rapidly. The law requires that the disabled man submit to a physical examination by a medical officer chosen by the bureau. The Public Health Service has made the majority of these examinations. While the disabled man is receiving compensation he must submit to reexamination as often as requested. To all persons entitled the bureau provides such medical, surgical, and hospital services and prosthetic apparatus as are reasonably necessary.

The following table shows the number of men treated in hospitals, discharged from hospitals, and the number of artificial limbs furnished by the bureau between October 6, 1917, and September 30, 1919:

Cases admitted to hospitals.....	15, 078
Cases discharged from hospitals.....	8, 943
Artificial arms supplied.....	979
Artificial legs supplied.....	1, 103

The medical treatment and hospitalization is done through the Public Health Service.

The bureau is notified by the Army and Navy of deaths and disabilities incurred in the service. These notifications are in the nature

of claims and are so carried on the records of the bureau. Investigation, however, often reveals the fact that there is in reality no dependency and that there is, therefore, no claim. At times men are erroneously reported as dead, relatives frequently can not be found, and communications are occasionally received definitely stating that no claim will be made. The principal reason for disallowing compensation claims on account of the death of men in the service is that the parents are not dependent, the deceased being single men. Frequently there are no dependents entitled to compensation. A few claims have been disallowed because death was not incurred in line of duty or was caused by the willful misconduct of the deceased. The principal reason for disallowing compensation disability claims is that disability is less than 10 per cent of a total disability. There have been a few cases disallowed because disability was not the result of service or because it was the result of willful misconduct.

When the status of parents changes so that they would not be dependent upon the deceased, had he been alive, the payment of compensation is terminated. Widows who remarry and children who attain 18 years of age are not entitled to the continuation of compensation payments. In the majority of cases military and naval compensation awards for disability are terminated either because of recovery from disability, or because of death of the disabled man.

Compensation is payable whether the dependency of the father or mother, or both, arises before or after the death of the person in the service, provided that dependency arises and claim is made within five years of the date of death. Compensation for disability is payable provided a medical certificate is secured within one year after discharge stating that the person at the time of his discharge or release was suffering from injury likely to result in death or disability and provided claim is made within five years after discharge or resignation. Frequently claims which may become compensable in the near future are allowed to remain pending. Similarly any disallowed claim may be reopened when parents become dependent or when the extent of the disability increases.

The delay in the settlement of claims for military and naval compensation because of death is due principally to the necessity of ascertaining from the War and Navy Departments information as to whether death occurred in line of duty, to the time requisite to obtain the return of claim papers properly filled out, or to the inability of the bureau to communicate with the claimants due to their failure to give notice of their change of address. Disability claims are delayed in settlement because of the necessity of securing medical examination and reexamination or because of the lack of completed claim papers.

Military and naval insurance.

The war-risk insurance act provides for the issuance by the United States of insurance against death and total permanent disability to every officer and enlisted man, to every member of the Army Nurse Corps, and to every member of the Navy Nurse Corps when employed in active service under the War or Navy Departments, upon written application to the bureau and the payment of premiums. The following table shows the number of applications, the amount of insurance, and the estimated premium income from date of passage of the war-risk insurance act to June 30, 1919:

Number of applicants for war-risk insurance to June 30, 1919.....	4, 334, 141
Number of applications for war-risk insurance to June 30, 1919.....	4, 520, 178
Total amount of insurance applied for to June 30, 1919.....	\$39, 046, 202, 000

Total insurance awards for death and for permanent total disability.....		1, 042, 457, 673. 48

The signing of the armistice on November 11, 1918, was quickly followed, as is well known, by the demobilization of the Students' Army Training Corps and other units. It immediately became apparent that the bureau must be informed at once as to every individual discharged to enable it to mark up its insurance records accordingly and get in touch with the ex-service man to inform him of the amount of his insurance premium, the date it became due, and such other facts as were deemed expedient.

A form of notice of discharge was agreed upon by the War and Navy Departments and the bureau, and arrangements were made that when a man was discharged from the service this form would be prepared and sent to the bureau direct and not through military channels. From this information the bureau was in a position to stop the payment of allotments and family allowances to the dependents of discharged men and to prepare the way for ex-service men to pay their premiums direct to the bureau. On the promptness with which these discharge notices were received depended to a large extent the proper functioning of the bureau, and it is to be regretted that in spite of every precaution taken considerable delay occurred in the receipt of these discharge notices from the military services.

Beginning in December, 1918, notices of insurance premiums due were issued, and in January and February hundreds of thousands were sent out. Of these, thousands were returned because of faulty addresses, and the bureau still has to contend with this problem of lack of proper address. However, by cooperation with the Post Office Department this situation constantly is being improved. Coupled with the difficulty of sending out notices which would reach the discharged men was that resulting from the flood of correspondence from these men, asking about their privileges under the war-risk insurance act and their rights to converted insurance. Nearly all the men were unsettled for a month or two after the termination

of military service, and many of them neglected their insurance. Many could not secure employment at once or did not earn enough to allow them to maintain their insurance. Thousands of others never received the premium notices mailed by the bureau. Much insurance was lapsed because the men had taken it out only on account of the danger incident to military service.

There was for a time a lack of information about the methods of paying premiums, the possibility of reducing the amount of policies, and the advantages of war-risk insurance. Many men allowed their insurance to lapse and it was necessary to reach them by an extensive campaign of conservation. The bureau has made every effort to point out to each individual the benefits of Government insurance and to acquaint him with the simple requirements necessary for the reinstatement of lapsed policies. From time to time reinstatement provisions have been liberalized, until now all that is necessary to reinstate insurance within 18 months after discharge is to remit to the bureau two months' premiums to cover, respectively, the grace period of one month during which protection was had, and one month in advance, with the statement that the insured is in as good health as at the time of discharge. It is thought that this recent regulation relative to reinstatement will be the means of saving to the insured and their beneficiaries the protection of millions of dollars of war-risk insurance.

United States Government life insurance.

Section 404 of the war-risk insurance act provides that not later than five years after the date of the termination of the war, as declared by proclamation of the President, the term insurance shall be converted, without medical examination, into such form or forms of insurance as may be prescribed by regulations and as the insured may request. The insurance offered under the provisions of this section of the act is known as United States Government life insurance and protects against death and permanent total disability.

Six forms of insurance are being offered: Ordinary life, 20-payment life, 30-payment life, 20-year endowment, 30-year endowment, and endowment at age 62. The rates of premium are attached to this report. Government insurance is very liberal in that the insured is protected against permanent disability, no matter at what age disability is incurred. Premiums may be paid monthly, quarterly, semiannually, or annually at the election of the insured. The insured will participate in and receive such dividends as may be determined and apportioned by the director, with the approval of the Secretary of the Treasury. These dividends may be taken in cash or left on deposit to accumulate at interest at a rate to be determined by the Secretary of the Treasury.

The new policies provide for most liberal nonforfeiture and loan provisions, including cash surrender value of the full reserve calculated on the American Table of Mortality and $3\frac{1}{2}$ per cent interest at the end of any policy year, or a participating paid-up policy for a less amount, or participating extended term insurance. The insured may borrow from the Government at any time after his policy has been in force one year, and provided his policy is in force, up to 94 per cent of the then cash value on the sole security of his policy. There are no restrictions as to travel, residence, occupation, or military or naval service. Claims are payable in 240 monthly installments of \$5.75 for each \$1,000 of insurance. The proceeds from this insurance are exempt from all taxation and are not assignable or subject to the claims of creditors of the insured or any beneficiary except claims of the United States arising under the war-risk insurance act.

The beneficiary may be changed at any time without the consent of the beneficiary, provided the new beneficiary is a member of the permitted class. Provision is made for payment of a life annuity to the beneficiary with payments for 240 months guaranteed, in lieu of the regular form of settlement.

Without any great effort being made to secure applications for conversion, 36,061 applications for converted insurance were received to September 30, 1919, of which 12,068 applications for \$42,435,500 of insurance have been approved, the average policy being for \$3,516.

Amendments.

Under the war-risk insurance act an enlisted man was compelled to make allotment from his pay in favor of his wife, if any, and might make allotments in favor of certain other dependent persons. In the case of a wife the Government added an allowance, and in certain other cases where a man made an allotment to persons dependent on him for support the Government also made an allowance, but the question of allowance in the latter instances was controlled by the question of dependency upon the enlisted man. When the war-risk insurance act was passed on October 6, 1917, and allotments were deducted from the pay of soldiers and sailors beginning in November, 1917, it became quite apparent that the bureau could not undertake detailed investigations in every instance before checks were sent to dependents of the men in the military and naval service if the payments were to go out promptly. So in a great many cases the bureau issued the checks to the parents of soldiers and sailors in advance of investigation. In the summer of 1918 many investigations of these cases were made, and it was found that in some cases parents were receiving allowances to which they were not entitled under the war-risk insurance act, because they were not dependent. The bureau, therefore, discontinued allowances and, under the law, was compelled to

deduct the previous payments from future remittances. This condition resulted in the amendment to the war-risk insurance act of February 25, 1919, which relieved the bureau of the requirement to seek reimbursement in cases of this kind, except where it is conclusively shown that the person receiving the allowance did not bear the relationship to the enlisted man which is necessary under the act and except in cases of manifest fraud.

An amendment to the Federal vocational rehabilitation act, approved July 11, 1919, authorized the Federal Board for Vocational Education to place disabled persons discharged from the military and naval forces in training without awaiting action by the Bureau of War Risk Insurance on the question of their eligibility to compensation under the provisions of the war-risk insurance act. This eliminated the delay involved in the previous practice requiring the submission of such cases to the Bureau of War Risk Insurance for determination of the question of compensation before undertaking training.

A man who has lost both hands, or both feet, or both eyes, or has been helpless or permanently bedridden, as the result of military or naval service, is entitled to the payment of \$100 per month as compensation for total permanent disability. For cases involving the loss of both hands and both eyes, or both feet and both eyes, or both hands and both feet, the Congress passed an amendment to the act approved August 6, 1919, providing another allowance of \$100 per month for a nurse or attendant, in addition to the \$100 allowed for total permanent disability.

ENEMY OR ALLY OF ENEMY INSURANCE COMPANIES AND OTHER FOREIGN INSURANCE COMPANIES.

The jurisdiction of the Federal Government over foreign insurance companies doing business in the United States has continued during the past year, the Treasury administering the provisions of the trading-with-the-enemy act dealing with the question. From time to time insurance companies already established in foreign countries are applying for licenses to do business in this country. Since October 6, 1917, or the date when the trading-with-the-enemy act went into effect, the Treasury has licensed 12 insurance companies which never before did business in the United States.

SOLDIERS' AND SAILORS' CIVIL RELIEF ACT AND BONDS ISSUED THEREUNDER.

Article IV of the act approved March 8, 1918, entitled "An act to extend protection to the civil rights of members of the Military and Naval Establishments of the United States engaged in the present war," otherwise known as the soldiers' and sailors' civil relief act,

provides that the Government will protect payments of insurance premiums in commercial companies on certain policies on the lives of men in the military and naval services to the extent of \$5,000 insurance on any one life. The law stipulates that the premiums due life insurance companies in such instances shall be certified by the Bureau of War Risk Insurance to the Secretary of the Treasury, and directs that, to secure the payment of such premiums, bonds of the United States shall be issued by the Secretary and registered in the names of the respective insurers. To June 30, 1919, the Bureau of War Risk Insurance approved 7,074 applications for benefits under this law. These approved applications protected \$11,266,633 of insurance in private companies and societies on the lives of men in the military and naval services. The amount of premiums guaranteed was \$326,747.69. Some of the premiums were paid by the insured, and to the extent of such aggregate payments it was unnecessary to issue bonds as a guaranty.

To June 30, 1919, \$179,500 of bonds had been issued to guarantee the payment of such premiums, of which \$100 had been canceled and \$179,400 were outstanding on that date. The issue of bonds by the Secretary of the Treasury upon the certification of the Bureau of War Risk Insurance is covered by Treasury Department Circular No. 115, dated July 1, 1918, which is attached to this report as Exhibit 84, page 473.

CUSTOMS.

During the fiscal year ended June 30, 1919, the effect of the war on international trade made itself felt, and, as in the preceding year, the customs revenues were far below normal. As compared with the fiscal year ended June 30, 1918, however, there was an increase of \$1,390,079 and a decrease of over \$112,000,000 as compared with the fiscal year ended June 30, 1914, immediately prior to the outbreak of the war in Europe.

The aggregate receipts collected by the customs service during the fiscal year 1919 amounted to \$186,241,436. Since the signing of the armistice, however, a considerable increase in customs revenue, as compared with the corresponding period in the preceding fiscal year, is apparent, and it is confidently expected that with the formal restoration of peace the customs dues collected under existing laws will increase to their former proportions, i. e., in the neighborhood of \$300,000,000. The value of imports for 1919 amounted to \$3,091,369,329, an increase of \$146,309,926 over those in 1918, while the exports during the same period amounted to \$7,224,867,829, an increase of \$1,296,582,188 over the exports of 1918, and nearly \$5,000,000,000 greater than the exports reported for the fiscal year 1914.

The expenditures of the customs service during the past fiscal year amounted to \$10,147,576, or an increase of \$138,652 over the fiscal year 1918. Although \$500,000 was added to the regular customs appropriation to defray expenses incident to the enforcement, by the customs authorities, of certain of the provisions of the espionage and trading-with-the-enemy acts, the economical expenditure of this special fund made it possible to return to the treasury an unexpended balance of over \$400,000.

During the past fiscal year, up to the signing of the armistice, the customs service was required to exercise extraordinary vigilance in order to insure the enforcement of the restrictive measures adopted by the Government with respect to the arrival and departure of persons and the importation and exportation of merchandise from and to foreign countries. In fact, during the war period the customs service became a kind of "clearing house" in the enforcement of war-time regulations of several departments and governmental agencies other than the Treasury, notably the State Department, the War Trade Board, and, to a more limited extent, the War Department. That all of these duties were expeditiously and efficiently performed is a tribute to the loyalty and devotion of the field force of the customs service worthy of the recognition and generous consideration of the Government.

During the past fiscal year it has been possible to resume the annual conferences of collectors of customs and appraisers of merchandise which were suspended during the war period. These conferences serve a most useful purpose because of the opportunity which they afford to discuss problems of common interest and to devise plans for the improvement of the service. They serve to strengthen the esprit de corps of the customs service as well as to standardize the methods of administration.

Under a new accounting procedure put into operation throughout the service during the past fiscal year it was possible to abolish the use of 194 forms used under the former system. The new procedure is, furthermore, expected to result in the saving of about half the time and labor formerly necessary at the large naval office ports in recording the transactions and rendering financial reports to the Auditor for the Treasury.

During the past fiscal year considerable work devolved upon customs officers by reason of the enforcement by them of the act of June 7, 1918, commonly known as the motor-boat act. Under that law, collectors of customs are required to see that every motor boat in their districts, except those owned by the Government, is numbered. Not only is it necessary to keep a record of the numbers assigned to every motor boat and the names and addresses of the owners thereof, but subsequent changes of ownership must likewise be recorded and violations reported to the Secretary of Commerce.

The enactment of the recent Federal prohibition law also imposed increased duties on customs officers during the past fiscal year. As soon as the manufacture and sale of liquor in this country was prohibited there was noticeable increased activity along the Mexican and Canadian frontiers in the smuggling of liquors. The special measures adopted to meet the situation, coupled with the severe penalties which have been imposed, will result in a steady decline in violations of this character.

In view of the continued demand for space in Federal buildings, reorganization of the force employed at the various large ports has been made during the past year whereby space formerly devoted to customs purposes has been made available for other Government agencies.

Every effort has been made during the past fiscal year to simplify, within the limits permitted by law, the customs practice and procedure. Furthermore, a number of improvements in the organization of the customs forces were effected with a view to expediting the conduct of public business.

PUBLIC HEALTH.

The period following the termination of hostilities with Germany, no less than during the war, ushered in additional responsibilities of a medical and public health nature which it became the duty of the Federal Government to discharge.

By far the most responsible of these duties is the important work, with which the Public Health Service is charged, of affording medical relief to the discharged heroes of the late war.

After the signing of the armistice, with resultant rapid demobilization, the lack of facilities for providing for the hospital care and treatment of discharged soldiers, sailors, and marines who were beneficiaries of the War Risk Insurance Bureau became so acute that Congress found it necessary to pass legislation to meet the situation. In the act of March 3, 1919, entitled "An act to authorize the Secretary of the Treasury to provide hospital and sanatorium facilities for discharged sick and disabled soldiers, sailors, and marines," provision was made for the acquiring by the Public Health Service of various properties, including hospitals and hospital sites, with equipment, etc., by transfer from the War Department and otherwise. By the end of the fiscal year, therefore, the Public Health Service had opened nine hospitals for this class of beneficiaries. Additional institutions were opened after the expiration of the fiscal year and further facilities will be provided for the future. At the present time virtually all of the beneficiaries of the war risk act are being cared for through the agencies of the Public Health Service.

In addition to caring for our soldiers, sailors, and marines, it was found desirable shortly after the passage of the above-mentioned act to enter into reciprocal arrangements with the Canadian Government whereby discharged soldiers of Canada in the United States are given necessary medical attention at our institutions and American soldiers in Canada are accorded the same privilege in that country.

The better coordination of the medical activities of the Government, so far as they related to the care of the discharged soldier, sailor, and marine, was effected during the past year by the conclusion of arrangements with the Federal Board for Vocational Education whereby medical officers of the Public Health Service are now making physical examinations, upon request of the District vocational officer of that board, of disabled men discharged from the service desiring to enter upon a course of vocational training.

The organization of the forces of the Public Health Service engaged in this relief work is practically completed. With its completion it is hoped to have built a machine of the highest efficiency and having first regard for the welfare of the soldier, sailor, and marine, and to have afforded facilities generally for carrying on what the Public Health Service recognizes to be a tremendously important function. It might be well to mention in connection with the obtaining of personnel for this work that the reserve corps, created by the act of Congress approved October 27, 1918, was of great assistance. Without the flexibility which it permitted in the corps, the service would have been unable to obtain sufficient and competent assistants for this work.

After-the-war program.

Upon the cessation of hostilities, the Public Health Service turned its attention toward the development of a comprehensive program to meet the urgent after-the-war health needs. The record of rejections during the draft showed that over 34 per cent of all draft registrants were rejected by examining boards on account of physical defects and diseases. Studies previously conducted by the service had indicated unmistakably that in large measure these defects and diseases could have been prevented had proper attention been given to them, especially in childhood. Therefore, this unsatisfactory condition of the public health is by no means necessary. Its persistence in the face of the energetic work of many departments and voluntary organizations shows primarily that health work has not been sufficiently organized and coordinated and has not received from governmental authorities the attention that it merits and must have if the country is to make rapid recovery from war losses and to render safe the development of new agricultural and industrial processes.

It is true that preventable disease rates have been lowered in many instances, and significant success has followed campaigns against

isolated diseases and insanitary conditions. The tuberculosis rate has steadily fallen. Typhoid fever has been made a negligible factor, and wherever active intelligent efforts have been made to combat it yellow fever has been kept out of the country. Nevertheless the public at large remains in ignorance of those main principles of health which investigations and practical experience have shown to be necessary for the prevention of disease. It is pitifully evident that such primary facts as the means of spread of typhoid fever and malaria, the effectiveness of smallpox vaccination, and the elementary principles of personal hygiene, such as the care of the teeth, are not known to the public generally. No national, comprehensive campaign, dealing with all phases of the public health, has been conducted. Until that is undertaken the information which the public will have in regard to disease prevention will be fragmentary. The problem is daily being aggravated by the fact that the population of the cities and of the country generally is increasing rapidly, making insanitary conditions more menacing.

In developing a program which will meet urgent national needs in public health, leadership must be assumed by some central authority. The Public Health Service is the natural agency to do so. In the past, under authority of Congress, it has built a sound foundation for the conduct of a national campaign for health by determining minimum standards of health and adequate measures for diminishing the annual toll of lives taken by preventable diseases and insanitary conditions.

The program which the Public Health Service has prepared to meet these urgent needs is comprehensive, dealing particularly with problems of industrial hygiene, rural hygiene, prevention of the diseases of infancy and childhood, water supplies, milk supplies, sewage disposal, malaria, tuberculosis, railway sanitation, municipal sanitation, health standard, health education, collection of morbidity reports, and the organization and training for duty in emergency of the reserve of the Public Health Service.

It is evident that the success of such a program will depend upon the active cooperation of Federal, State, and local health authorities and voluntary organizations to a degree not previously recognized. Experience has shown that this cooperation can best be secured on the Federal-aid extension principle. The service has already been authorized by Congress to carry on rural sanitation demonstrations under that plan, but the appropriations have been wholly inadequate. Additional authority is needed if this principle is to be extended to the entire field of public health. Experience has shown that this is the most feasible plan for obtaining the proper coordination of the activities of Federal, State, and local governments.

While there is grave necessity for strict economy in Government expenditures, it is fruitless and unwise to deny requisite funds for the

important work of the Public Health Service when human lives and the national welfare may depend upon the judicious use of Federal money.

Influenza.

In addition to activities relative to the control of the influenza epidemic, the Public Health Service concentrated efforts on the study of the disease. In view of known epidemiological facts, it is self-evident that the disease is highly communicable. There is a growing feeling that it may be communicable only in its earliest stages, particularly during the period of incubation.

A large amount of work was done to determine the prophylactic value of vaccines made from the influenza bacillus and of vaccines containing this organism together with various organisms which were regarded as secondary invaders and probably as the cause of the pneumonia which so often complicates influenza. The only experiments along these lines on which conclusions may be safely based are those in which a portion of the personnel in a group or in an institution was inoculated a number of days prior to the entrance of infection to the group or to the institution. Under these controlled conditions the vaccines which were tried failed to influence either the morbidity or the mortality of the disease.

PUBLIC BUILDINGS.

After the signing of the armistice, bids were invited for the construction of authorized Federal buildings and extensions, contracts for which had been deferred on account of the imperative needs for labor, material, transportation, and money in the prosecution of the war. It was found impossible, however, to resume building operations to any considerable extent because prices which had been gradually increasing for many months had reached a point where, except in a few isolated instances, the limits of cost fixed by law were insufficient.

This condition, affecting more than 100 buildings, has been brought to the attention of the Congress and estimates have been submitted of the amounts severally needed to be provided by way of increases in limits of cost to enable the department to proceed with the work of construction.

The restriction placed upon the letting of new contracts for the construction of Federal buildings during the war did not involve the suspension of the work of preparing drawings and specifications for buildings already authorized and not under contract, nor did it involve the suspension of construction work on buildings already under contract, and which at the time were in various stages of completion. Construction work, notwithstanding abnormal conditions of the most discouraging sort, was carried forward as rapidly as possi-

ble, with the result that 73 buildings and extensions were completed and made ready for occupancy during the year. On a production basis, and as a continuation of the building program of the preceding three or four years, this represented a rate of progress of a new building or extension every five calendar days.

The Postmaster General having reported to the Treasury that the Postal Service had outgrown many of the Federal buildings, the condition was brought to the attention of the Congress and a list of the buildings, together with estimates of the cost of extending a considerable number of them, has been submitted. Similar estimates for the remaining buildings will be transmitted in the near future.

Contractors' relief act.

When the United States entered the war with Germany on April 6, 1917, there were a large number of buildings under construction, the contracts for which had been awarded on bids prepared before that date. The demands which the war made upon the resources of the country for skilled workmen and materials variously affected these contracts. Priorities given for munitions displaced orders already given for building materials or postponed their being placed, and the commandeering of plants where building materials were being manufactured, together with transportation difficulties and increases in cost of freight, materials, and labor, caused unforeseen delays and expense to contractors. With a view to reimbursing these contractors, their subcontractors, and material men (including sureties who furnished means to enable failing contractors to complete their contracts, or who completed same as sureties), an act entitled "An act for the relief of contractors and subcontractors for the post offices and other buildings and work under the supervision of the Treasury Department, and for other purposes," was passed by the Congress and approved August 25, 1919.

That act provides for the reimbursement of such contractors, subcontractors, material men, and sureties for their increased costs due to war conditions for work performed after April 6, 1917, under Government contracts made or proposals submitted (and afterwards accepted without change in price) prior to that date. Claims must be submitted within three months from the passage of the act. Reimbursement is confined to the actual increased cost, exclusive of profits.

Already a number of claims have been filed, but as the act carried no appropriation for their payment the Treasury has submitted an estimate for an appropriation in an amount believed to be sufficient to care for the claims likely to be perfected soon, and further estimates will be submitted from time to time as funds are required to pay claims as audited.

National Archives Building.

Many of the priceless archives of the Government are exposed to destruction and loss for the want of safe and appropriate storage facilities. The necessity for a building specially designed for the preservation of these valuable records has long been recognized. Under authority conferred by the act of March 4, 1913, an examination has been made of the plans of a number of archives buildings of Europe, outline plans have been prepared and approved, a site selected, and estimates submitted for an appropriation for the land and the construction of the stack portion of the building. If the appropriation is made, work on the National Archives Building will be begun at the earliest practicable moment. The attention of the Congress is respectfully drawn to the very great and urgent need of providing funds for the construction of a building for this important purpose.

COAST GUARD.

Throughout the entire fiscal year 1919 the Coast Guard, in accordance with the provisions of the act of January 28, 1915, continued to operate as a part of the naval forces, and engaged in the prosecution of the war under the direction of the Secretary of the Navy.

The vessels of the Coast Guard rendered most useful service in the carrying out of war operations, and the service personnel were utilized to great advantage in various and important war activities under the direction of the Navy Department. Besides serving on Coast Guard cutters, officers of the service were attached to naval vessels in foreign and domestic waters, were on transport duty, and were assigned to training stations, aviation stations, navy yards, and naval districts. The Coast Guard during the World War maintained its high traditions and performed its war-time duties as part of the military forces of the country with marked credit and distinction.

On September 26, 1918, while escorting a convoy in European waters, the Coast Guard cutter *Tampa* was sunk with all hands in the Bristol Channel by a torpedo from an enemy submarine. Diligent search was made by destroyers in the vicinity of the disaster, but nothing was found but two unrecognizable bodies in sailor's uniform and some small pieces of wreckage. There were on board 8 officers, 4 warrant officers, and 100 enlisted men, all of whom, except the medical officer, belonged to the Coast Guard. Thus, in the performance of their duty, did 112 gallant officers and men give up their lives for their country. With the exception of the loss of the U. S. S. *Cyclops*, with her complement, this is the largest individual loss of life sustained by our naval forces during the war.

The Coast Guard was returned to the jurisdiction of the Treasury on August 28, 1919, by the following Executive order:

EXECUTIVE ORDER.

By virtue of the authority conferred by "An act authorizing the President to co-ordinate or consolidate executive bureaus, agencies, and offices, and for other purposes, in the interest of economy and the more efficient concentration of the Government," approved May 20, 1918, I do hereby make and publish the following order:

The important purposes for which the operation of the Coast Guard was temporarily transferred to the Navy under the act approved January 28, 1915, entitled "An act to create the Coast Guard by combining therein the existing Life-Saving Service and Revenue-Cutter Service" having been accomplished, and, it being for the best interests of the Government and for the efficient service of the Coast Guard in connection with the collection of the revenue that the Coast Guard be under the supervision of the Treasury Department, it is hereby directed that the Coast Guard shall on and after this date operate under the Treasury Department.

WOODROW WILSON.

THE WHITE HOUSE, *August 28, 1919.*

In accordance with the terms of the above order, the Coast Guard has resumed the performance of its peace-time functions under the Treasury.

ANCHORAGE CONTROL.

Under Title 2 of the espionage act, approved June 15, 1917, the Secretary of the Treasury was authorized, subject to the approval of the President, to make and enforce rules and regulations governing the anchorage and movement of vessels, foreign and domestic, in the territorial waters of the United States, and to exercise full control over such vessels while in ports of the United States. Under authority of this act, there was formed a board known as the board on the anchorage and movement of vessels. This board consisted of three members, representing the Treasury, War, and Navy Departments. An officer of the Coast Guard was designated as a representative of the Treasury on this board and also was made chairman. The board designated anchorage grounds at the ports of New York, Philadelphia, Norfolk, San Francisco, and the St. Mary River, and also prescribed regulations governing the movement of vessels in those ports as well as regulations governing the lading and unlading of explosives. The board did not deem it necessary to establish anchorage grounds and regulations governing the lading of explosives at other ports.

The office of captain of the port was created at each of the ports mentioned, except at San Francisco, and a United States Coast Guard officer was designated as captain of the port to enforce the regulations.

Many of the enlisted men and officers of the Coast Guard were engaged in this work and also assisted very materially in the enforcement of other laws and regulations pertaining to the entrance and

departure of persons into and from the United States, and in the search of vessels for contraband goods.

The Coast Guard officers and men also assisted materially in the enforcement of war-time regulations issued by this department pertaining to the operation, licensing, etc., of coastwise and harbor craft.

These special regulations have now been revoked and all of the activities above mentioned have practically ceased except those under the rules and regulations governing the anchorage and movement of vessels and the handling of explosives, which regulations are still in full effect and are being enforced by the officers and men of the Coast Guard.

BUREAU OF ENGRAVING AND PRINTING.

The demands of the Government upon the Bureau of Engraving and Printing during the fiscal year 1919 were the greatest in history. All previous records were broken by the engraving, printing, and delivery of 447,464,105 sheets of finished work, including Liberty bonds, Victory notes, war-savings stamps, thrift stamps, certificates of indebtedness, farm-loan bonds, stamps, and currency. The task was carefully and cheerfully performed by the employees of the bureau, who worked uncomplainingly in day and night shifts. There is no institution in the Government where greater care is necessary than in the Bureau of Engraving and Printing.

Prior to the war the law required the printing of the face of all money on hand plate-printing presses. To meet the emergency needs of the Government the statute was modified so as to authorize the Secretary of the Treasury to plate print currency and securities in whatever manner and by whatever process he deemed necessary. Under this authority, together with the installation of modern machinery and the application of up-to-date methods, the bureau has been equipped to meet the requirements and the necessities of the Government with respect to currency, stamps, and securities.

The bureau's cost-accounting system was improved during the year, and valuable information is now readily available as to the various operations to enable the director to determine definitely the costs of the output. This information is of particular value in connection with the product for which the bureau is reimbursed.

CONTRACTING AND PURCHASING.

As the business of the Government expands, there is an increasing need of centralization under some one authority of the great problem of contracting for and purchasing Government supplies. An initial step in this direction, with respect to contracting for supplies for use primarily by the Government services in Washington, was made by the establishment of the General Supply Committee, but the scope of its work is narrow at best. Within its limited field of

operations it has accomplished something in the reduction of purchase prices, but has left untouched the disadvantages to the public service at large which arise from a diversification of administrative views as to general and special needs and from a similar diversification in the form of the contract obligations assumed under the different branches of the service.

Similarly the establishment of Government fuel yards as authorized by the act of July 1, 1918, was a step in the general direction of centralized control to the advantage of the public service. But again the field of operations was made a limited one and its benefits confined to the branches of the Federal service and the municipal government in the District of Columbia and immediate vicinity.

These measures would seem to cover but a fraction of the general requirements for central control over contracting and purchasing. There is no good reason why the field of operations of a centralized authority of this character should be confined to a lesser territory than that marked by national boundaries, or why the benefits of organization, business judgment, and efficient methods should be employed only locally when the need for them is as widespread as the public service itself. It is thought that the whole needs of the Government in matters of contracting and purchasing, without regard to geographical points at which such needs may arise within the continental limits, could be as well, or better, served by the establishment of a central machinery as can the needs at any given point, such as the District of Columbia.

It can not be questioned that procuring supplies, including contracting for supplies for works of construction and manufactured articles or fabricated materials, is a task single in its nature, and one which would lend itself to central organization properly planned and equipped for its purposes, with a permanent chain of depots and warehouses for supplying expeditiously the requirements of all headquarters and field services. Of nearly equal importance in the advantages to be gained are the two questions of improved efficiency at a lower operating cost and the securing of supplies at lower prices. At present, without previous cooperation, the various branches of the public service are competitors among themselves in the markets which they seek, and their similar needs often operate to increase prices for each other under the general rule of supply and demand. This is an administrative problem of great importance in the interests of economy and efficiency, and I am sure that it will require but a cursory examination of the waste and duplication that inevitably must accompany the present system to make manifest the desirability for some drastic reform along the lines suggested.

The view has been advanced from some quarters that certain branches of service, whose requirements are specialized or highly

technical in character, would not obtain satisfactory results except through their own personnel. It is not seen that this view is tenable upon an analysis of the situation. If technical or expert services are available now in the various establishments of the Government, the same services could be utilized by a central control. The more or less centralized machinery brought into operation by the necessities of the world war may be cited as an answer to objections of this character. In practically all branches of the public service dealing with war activities the business control of technical equipment and its procurement was placed in the hands of others than the technical experts whose knowledge was essential to the design and choice of the equipment itself. Similarly, and more effectively perhaps, a central business control of procurement and distribution in time of peace can avail itself of expert services and technical knowledge wherever found within the Government. The fact that business men from civil life were called upon in a period of urgent haste to undertake the procurement through commercial channels of highly specialized articles of fabrication or manufacture and that their efforts were successfully applied with the cooperation of the technical experts within the service, is a sufficient indication that a central business control of procurement is not incompatible with the control by the appropriate branches of the character and choice of their technical supplies.

Aside from the economies to be derived from the application of good business judgment to purchasing, storing, and distributing, the establishment of a central control would have an influence of the utmost value on the contractual relations of the Government. Under the present divided control these are lacking in the uniformity which should obtain, and for that reason occasion many adjustments by the Treasury in the settlement of legal claims which might be avoided under a proper system of standardization of contract forms and management. The prevailing deficiencies in this respect came into view to an unprecedented degree as a result of recent war activities and have served to bring the subject into fresh and serious consideration. It will be recalled that a condition existed in contract affairs which necessitated legislative action for their adjustment not wholly within the strictly legal obligations of the Government.

It will require a trained and skillful organization, with all the facilities necessary for expansions in periods of emergency, if like experiences are to be avoided in the future. Under the urgency of the moment contract forms were disregarded in features essential to the interests of the Government and in many cases were entirely supplanted by informal agreements, written and oral. Form and procedure imposed by present laws were quite generally disregarded, and often were unknown to the officials drawn from civil life and

charged with the procurement of supplies because of their knowledge of industrial conditions. It is obvious that an established and effective central control, capable of expanding its facilities as circumstances require, would meet emergencies with greater security to the interests of the Government and contractors alike.

In the Government's everyday affairs, however, the need is just as urgent, and a lack of uniformity in the written instruments of contract is not alone responsible for the numerous claims against the Treasury. Faulty form and lack of standardization are supplemented to the disadvantage of the Government and contractors by the uncertainty and differences of construction rendered by administrative officers during the period of fulfillment, by unwarranted administrative acts in contravention of explicit terms of contract, both for and against the interests of contracting parties, and by all the many omissions and commissions which are due to the absence of a single supervision.

It is thought that these and a host of evils not touched upon can best be eradicated by combining in one establishment the adequate authority for contracting and purchasing, with all needed facilities, and unlimited as to its field of operations within the United States. To state it in its simplest form, it is a mere matter of combining in one establishment the classes of business common to all, with proper provision for specialized needs. It is not open to doubt that such action would redound immeasurably to the benefit of the public treasury and relieve all branches of the public service of a burden of duties not now administered satisfactorily to the disbursing and accounting authorities. Nor is it open to doubt that it can be effectively accomplished.

Something might be said of the advantages which would accrue to the public interests from measures which might be designed to cure specific evils alone, such as requiring as separate considerations greater uniformity in contract forms and methods of contracting, a revision of the statutory requirements as to advertising and proposals, and kindred reforms, each desirable in itself. But these would leave unsolved the really big problem presented by the situation as a whole. As has been pointed out in the annual report of the Comptroller of the Treasury, the sums involved are large, the public interests concerned are vital and far-reaching, the administrative and accounting duties are complex and burdensome, and the private interests concerned are equally important, often involving the business success or failure of contractors. The contract requirements of the Government standing alone constitute almost a department of Government in themselves, with their own legal and equitable considerations, and a mass of laws and court decisions surrounding their fulfillment, adjustment, and settlement. The present moment, with the experi-

ences of the war fresh in mind and much data available for consideration, would seem to be a propitious one for the study of all purchasing and contracting needs and the proper establishment of machinery necessary to an efficient, expeditious, and economical fulfillment of those needs for the purposes of both ordinary periods and periods of crisis.

It has been considered whether some action might be taken by executive authority, in the absence of legislative enactment, to bring purchasing and contracting operations as found in the various departments and independent establishments into some sort of correlation for the entire executive branch of the Government, but it is thought that the magnitude of the task and its intimate contact with all agencies of that branch argue for a completeness of control and such legal authority for the step as can be granted by the Congress alone.

A proper regard for economical and efficient administration, its bearings on the public treasury, and the judgment of competent critics all combine to urge the establishment of such an agency as the one proposed. Unlike many projects for which consideration is so often asked, it would unify and tend to contract rather than expand the administration of present activities.

GENERAL SUPPLY COMMITTEE.

In advance of provision for the centralized control of all contracting for and purchasing of supplies for Washington and the field, as recommended above, it is urgently suggested that prompt measures be taken at least to remodel and expand the functions of the General Supply Committee, which at the present time is only an agency of contracting for Government supplies. In the absence of the suggested general legislation, a plan should be evolved under which common supplies required for use by two or more of the executive departments or independent establishments of the Government in Washington would be contracted for, purchased, stored, and distributed through a single bureau. In lieu of the General Supply Committee there should be created a bureau of supplies consisting of three divisions, one of which should include the present general functions of the General Supply Committee, to be known as the division of contracts, the second to be known as the division of purchases, and the third to include the present Division of Property Transfer of the committee and to be known as the division of stores. This would require the maintenance of a suitable warehouse adequately stocked with all articles in common use for distribution to the Government service. The ability to carry in stock various classes of supplies commonly required by the departments would permit the prompt filling of all requests and obviate the necessity for open-market purchases which, to a great extent, exists at the present time. Such a

bureau would be able to buy supplies at opportune seasons and in quantities that undoubtedly would greatly reduce the cost.

With respect to the operations of the General Supply Committee during the fiscal year 1919, the records show that reported purchases by the various Government offices under contracts negotiated by the Secretary of the Treasury through the committee amounted to \$10,321,438.18. As certain establishments are not required by law to report purchases and others failed to report fully, the total amount of purchases during the year probably exceeded \$15,000,000.

After the signing of the armistice, it became apparent that large quantities of office material, supplies, and equipment would become surplus because of the cessation of war activities, and on December 3, 1918, the President, on the recommendation of this department, issued an Executive order directing that surplus material, supplies, and equipment falling into disuse because of the cessation of war activities, or for other reasons, be transferred to the Secretary of the Treasury for reissue to other Government establishments through the General Supply Committee. Under that order the General Supply Committee functions as a clearing house for the executive departments and independent establishments of the Government in the District of Columbia, in that it takes over all the surplus material, supplies, and equipment, classifies, warehouses, repairs, and reissues it from time to time to other governmental establishments as their needs arise. In making purchases from available funds for needed office material, supplies, and equipment the order required the several executive departments and independent establishments and the municipal government of the District of Columbia to buy from the stores of the General Supply Committee if the articles were obtainable from that source.

To carry the order into effect, the Congress granted an appropriation of \$100,000 for the remainder of the fiscal year 1919 and for the fiscal year 1920, and stipulated that the Executive order shall continue in effect until June 30, 1920, without modification, except that proceeds from the transfer of appropriations thereunder shall be covered into the Treasury as miscellaneous receipts.

From December 10, 1918, to June 30, 1919, there was transferred to the General Supply Committee \$1,031,948.54 worth of material, of which \$555,195.34 worth was issued. That amount includes discounts allowed on account of deterioration from use which equaled $15\frac{1}{2}$ per cent. The balance chargeable to stores account was, therefore, \$476,753.20. The total expense of operation; that is, overhead charges, for the period mentioned was \$24,297.30, or $4\frac{3}{10}$ per cent of gross sales.

Section 5 of the act approved July 11, 1919, provided that the heads of the several executive departments and other responsible

officials, in expending appropriations contained in that or any other act, so far as possible, should purchase material, supplies, and equipment, when needed and funds were available, from other services of the Government possessing material, supplies, and equipment no longer required because of the cessation of war activities.

To carry out that provision of the law, the duties of the General Supply Committee were further increased by the Executive order of August 27, 1919, by which the committee was designated as a central body of information with respect to supplies, and, as such, to receive reports of all surplus material, supplies, and equipment available by reason of the cessation of war activities in Government services throughout the United States. Record of material reported as surplus is maintained in the committee for the information of all Government departments and establishments.

There has been transferred to the General Supply Committee, under the Executive order of December 3, 1918, certain motor equipment, which it is unable to sell to other services of the Government. This consists of a number of old and badly worn trucks, automobile bodies, and motor cycles, which it would appear to be to the interest of the Government to sell at public auction. It is, therefore, recommended that the necessary authority be granted to permit the sale of equipment now or hereafter transferred to the General Supply Committee, for which there is no demand, and the sale of which would be in the interest of the Government, and further that, in the case of articles purchased at high prices during the war, the committee be allowed to transfer them to governmental services at a fair market value.

THE INTERNATIONAL HIGH COMMISSION.

The work of the International High Commission has gone on steadily through the fiscal year 1919 with a constantly growing record of accomplishment. With the signing of the armistice and the conclusion of hostilities, it was felt that the time was opportune and appropriate for the holding of a second Pan-American financial conference. Accordingly, at the suggestion of the commission which was established to carry out the recommendations of the first Pan-American conference, the President, through the Secretary of State, has invited the governments of Central and South America again to send their ministers of finance and other appropriate representatives to confer with the Secretary of the Treasury at Washington in January, 1920, on the financial and commercial problems of the American Republics. This second conference will open on January 12 and close on January 17.

Acting under the direction and coordination of the central executive council, the various national sections of the commission are now

engaged in studying a tentative program for the second conference which has been formulated by the council and in assembling data for consideration at that meeting. Careful studies of the public debt, currency system, banking laws and practices, and principal economic requirements of each Republic of Central and South America and the West Indies have been undertaken. The council also is giving particular attention to questions of communication and transportation and has set on foot a detailed investigation of the requirements for the rehabilitation and extension of maritime and land transportation facilities in Latin America. In this connection the council is receiving the hearty cooperation of the Department of Commerce and the United States Shipping Board, which have undertaken special surveys of transportation necessities in order to make the information available for the conference. Data also is being obtained with respect to the cable and wireless situation in Latin America.

The International Trade-Mark Registration Bureau at Habana has advanced still further toward effective operation, and the last obstacles to its actual receipt and registration of trade-marks from the countries of the Northern Group were being cleared up as the fiscal year ended. It is now actively functioning. Our own enjoyment of all the benefits of the trade-mark convention of 1910, so far as it is in effect, was somewhat handicapped during the fiscal year 1919 by the lack of enabling legislation to permit the Commissioner of Patents to open a register for marks communicated to him from the international bureau or bureaus. That difficulty, it is hoped, will be overcome during the present fiscal year.

This convention will serve as a practical device for the better security of the industrial property and good will of manufacturers and exporters not only in the United States, but in all the American Republics. It seeks to make the process of registration simultaneous, expeditious, and inexpensive; it does not affect the substance of domestic trade-mark regulations in any manner. It merely provides that the registrant in any one of the signatory countries may secure through the international bureaus registration in all the other signatory countries, provided there is no inherent obstacle in the nature of his trade-mark or in the technical provisions of the domestic trade-mark law. The rights acquired are not everywhere the same. The registrant is put on an equal footing with the domestic applicant for trade-mark registration in each of the countries to which the international trade-mark bureaus communicate the fact of its international registration. He acquires no greater rights than citizens of those countries, nor any less. He gets as much protection in those countries as their laws afford, just as citizens of those countries acquire as much protection in his country as his domestic law will

grant. It is a notable achievement of the International High Commission to have assisted in removing a cause of uncertainty, delay, and loss in the protection of our foreign commerce, and to have stimulated the commerce of other countries by encouraging the distribution among them of all articles wherein proprietary right and good will constitute important assets.

Associated with the preparation for the financial conference is the study that has been undertaken by the commission of the laws under which corporations and branches of foreign companies may organize or operate in the Republics of Central and South America. This inquiry is in line with the purpose of the commission to study the commercial law of the American Republics in the hope of removing the chief obstacles to closer commercial intercourse and gradually bringing about an approximation to the scientific standards of international commercial law and practice. With that serious object in view, the commission has not ceased to labor for uniformity of the law relating to bills of exchange and checks, bills of lading, warehouse receipts, and conditional sales. The careful consideration of the models proposed for legislation on any of these topics will require, on the part of the national legislatures of Latin America, a by no means inconsiderable period of time, as it has required and still requires in the legislatures of our several States in this country. The council is satisfied, however, with the progress made in this most important field and looks for the gradual acceptance of the rules and standards of practice submitted.

During the year special attention was given by all of the national sections to the two important conventions proposed by the council several years ago, the first relating to an international gold clearance fund and the second having to do with the simplification of regulations governing commercial travelers and their samples (Exhibits 85 and 86, pages 475 and 477). The commercial traveler convention has been signed by the United States and Uruguay, Guatemala, Salvador, Panama, Venezuela and Paraguay. Negotiations with a dozen other countries are now under way. The gold clearance fund convention is also in process of negotiation, although it was not formally signed with any country before the end of the fiscal year.

The commission is endeavoring to popularize the use of the Brussels classification of merchandise for statistical purposes, and to that end has issued a series of bulletins presenting the annual import and export statistics of each of the Republics, arranged in accordance with the Brussels classification and with values expressed in national currencies as well as in the international money of account agreed upon by the commission for this purpose and known as the Panamericano. The Department of Commerce publishes in English the material relating to the United States, while the commission publishes in Spanish and English alike the material relating to the other republics.

At the beginning of the fiscal year 1919, the expenses of the commission were still being defrayed from an appropriation of \$40,000 made in the act approved February 7, 1916. The Sixty-fifth Congress appropriated \$25,000 for the fiscal year 1919. The use of that appropriation, however, did not begin until October, 1918, when the appropriation of 1916 was exhausted. At the close of the fiscal year a balance of \$11,000 reverted to the general fund. For the fiscal year 1920 the Congress has appropriated the sum of \$25,000 for the expenses of the commission. The sum of \$50,000 also has been appropriated for the second Pan American Financial Conference, to remain available until expended.

In order properly to carry on the work of the United States section of the International High Commission during the fiscal year 1921, with due regard for its record of accomplishment and the important matters it has undertaken, it is my conviction that the appropriation made by the Congress should be increased to \$30,000.

During the year 1919 the membership of the United States section of the commission was as follows: The Secretary of the Treasury, chairman; John Bassett Moore, vice chairman; Duncan U. Fletcher, Andrew J. Peters, Paul M. Warburg, Samuel Untermyer, John H. Fahey, and John H. Wigmore. L. S. Rowe, secretary general.

The vacant place on the commission has since been filled by Herbert Fleishhacker, of San Francisco, formerly a member of the Federal Advisory Council and president of the Anglo and London Paris National Bank. The staff of the commission consists of an assistant secretary general, six technical assistants, and a corresponding number of clerical assistants.

SURETY BONDS FOR GOVERNMENT OFFICERS.

The attention of the Congress is directed to the increasing number of bonds required by the Government from its employees. It is estimated that approximately 200,000 employees, including the Postal Service, give fidelity bonds in varying penalties ranging from \$500 for a rural letter carrier to \$500,000 for an assistant treasurer of the United States. Most of these bonds are executed by bonding companies, and the premiums, which are paid by the employees themselves, are fixed within the limitation of the act approved August 5, 1909.

The growth and extent of the business suggest the desirability of considering the establishment of a plan whereby the Government would bond its own employees, who would pay premiums into a mutual fidelity fund to be used for the payment of losses arising under the bonds. This would be a wholly safe and satisfactory way of affording protection to the Government and at the same time undoubtedly reducing the premium charge to employees. In this connection it

should be pointed out that the joint commission of Congress created by the act of August 5, 1909, recommended the creation of a mutual bonding fund as the solution of the Government's bonding problem.

If such a plan be not adopted at this time, attention is called to the work now being done by the Treasury through the supervision exercised over bonding companies writing bonds for Government officers in all departments. The act of March 23, 1910, amending the act of August 13, 1894, merely transferred from the Attorney General to the Secretary of the Treasury the limited supervision provided for under the last-mentioned act, but did not give the Treasury Department any additional supervisory authority over these bonding companies. Reasonable funds should be provided to permit the effective enforcement of the statute by affording facilities for making periodical examinations of the financial condition of bonding companies, thereby securing a larger measure of protection for the Government. A large sum would not be required for this purpose.

Under regulations approved by the Secretary of the Treasury, bonding companies doing business with the Government are not permitted to assume a liability on account of any single risk or bond, with the exception of certain customs and internal-revenue bonds, in excess of 10 per cent of their capital and surplus as fixed by the Treasury Department. While the bonding companies have acquiesced in the rigid enforcement of this 10 per cent limitation, it is believed that the best interests of the Government would be served if appropriate legislation were enacted by the Congress definitely fixing the limit of liability. It is respectfully recommended that the act of March 23, 1910, be amended accordingly.

REPRESENTATION OF TREASURY ON WAR TRADE BOARD.

The Secretary of the Treasury continued during the current year to be represented on the War Trade Board, thus keeping that board in touch with the financial policies of the Treasury Department and securing for the Treasury Department the benefit of full information in regard to the trade and blockade policies of the War Trade Board.

Following the signing of the armistice, the War Trade Board undertook to remove restrictions on trade as rapidly as conditions warranted such removal, and by June 30, 1919, all but a few remnants of those restrictions had been removed. By order of the President, the functions of the War Trade Board were on that date transferred to the Department of State to be administered by the War Trade Board section of the Department of State, and the existence of the War Trade Board came to an end.

I take this occasion to record my judgment of the valuable service performed by that board and my appreciation of its cordial cooperation with this department.

PANAMA CANAL.

The general fund of the Treasury was charged during the fiscal year 1919 with \$12,265,775.08 on account of the Panama Canal, including \$1,726,857.87 for construction work and \$10,538,917.21 for fortifications, maintenance, and miscellaneous expenditures. The general fund was credited during the year with \$6,777,046.55 receipts from tolls, etc., making a net expenditure for the year of \$5,488,728.53. The total amount expended for canal construction, fortifications, maintenance, etc., from the general fund to June 30, 1919, exclusive of reimbursements from sales of bonds, was \$313,474,507.02, while the amounts received from Panama Canal bonds, including premiums thereon, issued in 1907, 1908, 1909, 1911, and 1912 was \$138,600,869.02, making the total expenditures on account of the Panama Canal to the close of the fiscal year 1919 \$452,075,376.04.

CONTINGENT FUND.

I respectfully request that the Congress appropriate for the fiscal year 1921 the sum of \$15,000 as a contingent fund for the Secretary of the Treasury. This amount was asked for the fiscal year 1920, but was not granted.

Out of this fund in previous years improved methods and economies have been effected and duplication of work eliminated.

FINANCES.

The following statements showing receipts, disbursements, estimates, and the condition of the Treasury are submitted:

RECEIPTS AND DISBURSEMENTS.¹

Fiscal year 1919.

The receipts and disbursements of the Government during the fiscal year ended June 30, 1919, were as follows:

(See details on pages 188 to 198.)

GENERAL FUND.

Receipts into the general fund, including trust-fund receipts, but excluding postal revenues:

Customs.....		\$183, 428, 624. 78
Internal revenue—		
Income and excess-profits taxes.....	\$2, 600, 762, 734. 84	
Miscellaneous.....	1, 239, 468, 260. 01	
		3, 840, 230, 994. 85
Sales of public lands.....		1, 404, 705. 12
Miscellaneous.....		622, 539, 527. 71
Total ordinary receipts.....		4, 647, 603, 852. 46

¹ "Disbursements," as used in this statement, in addition to actual expenditures, include unexpended balances to the credit of disbursing officers.

Disbursements,¹ from the general fund for current expenses and capital outlays, including trust-fund disbursements, but excluding postal service paid from postal revenues and Panama Canal disbursements:

For civil establishment—

Legislative establishment.....	\$16,605,836.15

Excess of public-debt receipts over public-debt disbursements.....	\$13,238,410,506.62
Excess of total disbursements over total receipts.....	1,059,349,775.36

SUMMARY OF GENERAL FUND TRANSACTIONS,

Fiscal year ended June 30, 1919.

	Receipts.	Disbursements.
Ordinary receipts, including trust-fund receipts, but excluding postal revenues.....	\$4,647,603,852.46	
Disbursements ¹ for current expenses and capital outlays, including trust-fund disbursements, but excluding postal service paid from postal revenues and Panama Canal disbursements.....		\$15,365,362,741.76
Special disbursements.....		3,574,512,664.15
Panama Canal receipts, tolls, etc.....	6,777,046.55	
Panama Canal disbursements.....		12,265,775.05
Public debt—receipts and deposits.....	29,075,976,515.75	
Public debt redemptions and purchases.....		15,837,566,009.13
Total receipts into the general fund.....	33,730,357,414.76	
Excess of disbursements over receipts.....	1,059,349,775.36	
Grand totals.....	34,789,707,190.12	34,789,707,190.12
General-fund balances:		
Balance free of current obligations, June 30, 1918.....		1,319,347,364.14
Pay warrants issued in excess of receipts, as above, fiscal year 1919.....	\$1,059,349,775.36	
Deduct increase in disbursing officers' credits, June 30, 1919, over disbursing officers' credits, June 30, 1918.....	794,069,792.42	
		265,279,982.94
		1,054,067,381.20
Deduct increase in matured interest obligations outstanding June 30, 1919, over such obligations outstanding June 30, 1918.....		51,335,339.20
Balance free of current obligations, June 30, 1919.....		1,002,732,042.00

¹ "Disbursements," as used in this statement, in addition to actual expenditures, include unexpended balances to the credit of the disbursing officer.

POSTAL SERVICE.

[Exclusive of Post Office Department proper, which is included in "civil establishment."]

Postal-revenue receipts.....	\$364,847,126.20
Postal service paid from postal revenues.....	362,504,274.24
Excess of receipts.....	2,342,851.96

UNITED STATES NOTES (GREENBACKS).

Issues to replace worn and mutilated notes.....	243,184,000.00
Worn and mutilated notes retired.....	243,184,000.00

The redemptions during the year of the notes unfit for circulation necessitated the issue of a like amount thereof to maintain the outstanding aggregate of the notes as required by law.

GOLD RESERVE FUND.

Balance in reserve fund June 30, 1918.....	\$152,979,025.63
Balance in reserve fund June 30, 1919.....	152,979,025.63

The redemptions of notes for gold from the reserve fund during the year were: United States notes, \$1,506,000.

As the redeemed notes were exchanged each day for gold in the general fund, the reserve was maintained at the fixed sum required by law, including \$2,979,025.63 tax on additional circulation received under act of May 30, 1908.

TRUST FUNDS.

(Held for the redemption of the notes and certificates for which they are respectively pledged.)

Gold coin and bullion.....	\$735,779,491	Gold certificates out-	
Silver dollars.....	169,148,295	standing.....	\$1,550,259,669
Silver dollars, 1890.....	1,745,161	Less amount in the	
		Treasury.....	814,480,178
		Net.....	735,779,491
		Silver certificates out-	
		standing.....	203,943,000
		Less amount in the	
		Treasury.....	34,794,705
		Net.....	169,148,295
		Treasury notes (1890)	
		outstanding.....	1,754,000
		Less amount in the	
		Treasury.....	8,839
		Net.....	1,745,161
	906,672,947		906,672,947

GOLD SETTLEMENT FUND, FEDERAL RESERVE BOARD.

Gold coin.....	\$1,416,086,099.10
----------------	--------------------

SINKING FUND.

The securities redeemed on account of the sinking fund, included in general-fund disbursements, were as follows:

Fractional currency.....	\$1, 823
One-year notes of 1863.....	30
Funded loan of 1891.....	4, 050
Refunding certificates.....	360
Funded loan of 1907.....	80, 550
Compound-interest notes.....	90
Consols of 1867.....	100
Total.....	87, 003

CONDITION OF THE TREASURY JUNE 30, 1919.

The public debt of the United States at the close of the fiscal year 1919 is set forth in detail, as follows:

Interest-bearing debt:

Loan of 1925, 4 per cent.....	\$118, 489, 900. 00
Consols of 1930, 2 per cent.....	599, 724, 050. 00
Panama Canal loan, 2 per cent.....	74, 901, 580. 00
Panama Canal loan, 3 per cent.....	50, 000, 000. 00
Postal savings bonds, 2½ per cent.....	11, 349, 960. 00
Conversion bonds, 3 per cent.....	28, 894, 500. 00
Certificates of indebtedness.....	3, 624, 983, 490. 00
War savings certificates.....	953, 997, 434. 77
First Liberty loan, 3½ per cent.....	1, 410, 071, 600. 00
First Liberty loan converted, 4 per cent..	167, 792, 750. 00
First Liberty loan converted, 4½ per cent..	403, 440, 100. 00
First-Liberty loan second converted, 4½ per cent.....	3, 492, 050. 00
Second Liberty loan, 4 per cent.....	704, 204, 350. 00
Second Liberty loan converted, 4½ per cent	2, 862, 252, 250. 00
Third Liberty loan, 4½ per cent.....	3, 958, 552, 700. 00
Fourth Liberty loan, 4½ per cent.....	6, 794, 504, 587. 00
Victory Liberty loan, 3½ and 4½ per cent..	3, 467, 844, 971. 77
	<u>\$25, 234, 496, 273. 54</u>

Debt on which interest has ceased:

Funded loan of 1891.....	20, 800. 00
Loan of 1904.....	13, 050. 00
Funded loan of 1907.....	407, 350. 00
Loan of 1908-1918.....	936, 000. 00
Refunding certificates.....	10, 840. 00
Old debt.....	900, 330. 26
Certificates of indebtedness, matured.....	8, 821, 000. 00
	<u>11, 109, 370. 26</u>

Debt bearing no interest:

United States notes (greenbacks).....	346, 681, 016. 00
Bank notes, redemption account.....	35, 830, 457. 00
Old demand notes.....	53, 012. 50
Fractional currency.....	6, 843, 314. 82
	<u>389, 407, 800. 32</u>

Total interest and noninterest bearing debt, exclusive of certificates and notes offset by coin and silver bullion.... 25, 635, 013, 444. 12

CASH IN THE TREASURY JUNE 30, 1919.

ESTIMATES FOR THE FISCAL YEARS 1920 AND 1921.

The estimates of receipts and expenditures for the fiscal years ending June 30, 1920, and June 30, 1921, are given in the subjoined tables. The estimates of receipts are based upon existing laws. The estimates of expenditures were made by the respective Government departments and independent establishments.

The following tabulation summarizes the estimated receipts and expenditures for the fiscal year 1920 and, on the basis of the latest information received from the various departments, shows the estimated results at the close of the year:

FISCAL YEAR 1920.

Balance in the Treasury June 30, 1919, free of current obligations....	\$1,002,732,042
Estimated receipts:	
Ordinary.....	\$6,100,250,000
Panama Canal.....	7,200,000
Public debt.....	1,210,556,634
Total.....	\$7,318,006,634
Estimated expenditures:	
Ordinary (exclusive of expenditures from such additional appropriations as may be made for the Railroad Administration).....	6,097,237,892
Special and Panama Canal.....	715,284,837
Public debt (including \$3,633,804,490 certificates of indebtedness outstanding June 30, 1919).....	4,664,104,490
Total (incomplete).....	11,476,627,219
Excess of estimated expenditures (incomplete) over estimated receipts.....	4,158,620,585
Estimated deficit in the general fund June 30, 1920.....	3,155,888,543
Estimated amount necessary for balance in the general fund June 30, 1920.....	750,000,000
Estimated gross deficiency June 30, 1920.....	3,905,888,543

There are many uncertainties in connection with the above figures which must be taken into consideration in attempting to forecast the condition of the Treasury at the close of the current fiscal year, and, of course, this department is not in possession of information that would enable it to form an opinion as to the deficiency estimates which may be presented to the Congress nor as to the additional appropriations the Congress may make.

On July 25, 1919, in a letter to the banks and trust companies of the country, which is quoted in full elsewhere in this report, it was roughly estimated that the expenditures would exceed the receipts for the fiscal year 1920 by not more than \$1,032,000,000, the amount of the deferred installments of the Victory loan. That estimate was made upon the assumption that the amount of certificates of indebtedness outstanding on June 30, 1919, would be taken care of through funding operations or otherwise. The estimate of receipts now presented exceeds that shown in the letter referred to by \$783,006,634.

The difference is largely in the item "Miscellaneous receipts," and for the most part represents salvage of war materials and supplies. Such receipts as these should clearly be applied to the reduction of the floating debt, represented by certificates of indebtedness.

It is important to point out that the estimated expenditures for the Railroad Administration for the fiscal year 1920 are based entirely upon appropriations already made, and do not include any expenditures that may result from such additional appropriations as may be granted for the current year. The Railroad Administration on the date of this report was unable to estimate what additional sums would be expended during the fiscal year 1920, inasmuch as the amounts that will be required are almost entirely dependent upon congressional action in connection with the return of the railroads to private control and the settlement of accounts between the carriers and the Government.

The following is a summary of the estimated receipts and expenditures for the fiscal year 1921 and, on the basis of incomplete information, shows the estimated results at the close of the year:

FISCAL YEAR 1921.

Estimated deficit in general fund June 30, 1920 (as above).....\$3, 155, 888, 543
Estimated receipts:

Ordinary.....	\$5, 412, 000, 000
Panama Canal.....	8, 000, 000
Public debt.....	200, 350, 000

Total.....	\$5, 620, 350, 000
------------	--------------------

Estimated expenditures:

Ordinary (exclusive of expenditures by the Railroad Administration, of expenditures from appropriation of \$280, 000, 000 included by the Shipping Board in the Book of Estimates, of expenditures on account of increased compensation of Government employees, of expenditures on account of increased compensation in the Postal Service, of expenditures on account of new construction in the Navy).....	3, 517, 752, 594
Panama Canal.....	18, 245, 391
Public debt.....	437, 800, 000

Total (incomplete).....	3, 973, 797, 985
-------------------------	------------------

Excess of estimated receipts over estimated expenditures (incomplete).	1, 646, 552, 015
--	------------------

Estimated deficit in the general fund June 30, 1921.....	1, 509, 336, 528
--	------------------

Estimated amount necessary for balance in the general fund June 30, 1921.....	500, 000, 000
---	---------------

Estimated gross deficiency June 30, 1921.....	2, 009, 336, 528
---	------------------

There are even more uncertainties in the estimates for the fiscal year 1921, as stated in the above table, than in the estimates for the current fiscal year. For instance, the estimated receipts include \$500,000,000, representing the capital stock of the United States Grain Corporation, which the Wheat Director hopes to return during the first half of the fiscal year 1921. It is not possible for the director to state positively at this time that the amount will be returned. With respect to estimated expenditures for the fiscal year 1921, it should be pointed out that the Railroad Administration is unable to make an estimate of expenditures during that fiscal year, for the same reason that it is unable to make an estimate of additional expenditures for the current fiscal year. The Chairman of the United States Shipping Board did not include in the estimate of expenditures for the Shipping Board and the Emergency Fleet Corporation any part of the \$280,000,000 for additional ship construction which has been incorporated in the estimate of appropriations for 1921, because, he states, that the matter is dependent upon the action of the President and the Congress in connection with future policy. As it is not known whether the Congress will continue the present increased compensation of Government employees or revise the salaries on the basis of the report of the Joint Congressional Commission on Reclassification of Salaries, no estimate of expenditures in this connection could be included. The above figures likewise do not include any estimate on account of increased compensation in the Postal Service, and the Postmaster General states that if the legislation in this respect enacted this year is repeated next year it will require an additional expenditure of \$40,000,000. The figures submitted by the Secretary of the Navy include no estimate for new construction, as it was necessary for him to study the question further and consequently defer his recommendations until the Congress shall have assembled in regular session.

The above figures show that the estimated expenditures for both of the fiscal years 1920 and 1921 are incomplete. This is particularly true with respect to the latter. Even in their incomplete form, the figures indicate that there will be a deficit in the Treasury at the close of the two-year period ending June 30, 1921, of \$1,509,336,528, if the floating debt is decreased by the amount of certificates of indebtedness outstanding on June 30, 1919. The amount of such debt should be reduced as rapidly as possible, and certainly to the extent of receipts on account of salvage from war materials and supplies, the repayment of stock of Government-owned corporations, and the like.

In connection with the receipts of both fiscal years referred to above, it should be borne in mind that the word "ordinary" in the tables has purely a technical meaning, and that in "ordinary receipts"

are included such exceptional items as repayment of foreign loans, salvage of war materials and supplies by the War and Navy Departments, and repayments of appropriations by the Shipping Board, Wheat Director, etc.

The estimates of receipts and expenditures for the two fiscal years are given in further detail in the following tables:

Fiscal year 1920.

RECEIPTS.	
Ordinary receipts:	
From customs.....	\$275,000,000
From internal revenue—	
Income and profits tax.....	\$3,750,000,000
Miscellaneous.....	1,240,000,000
From sales of public lands.....	4,990,000,000

Bonds purchased from payments on foreign obligations	90, 000, 000
Miscellaneous redemptions of the debt ...	300, 000

Total estimated public debt expenditures..... 4, 664, 104, 490

Grand total estimated expenditures..... 11, 476, 627, 219

¹ The estimated expenditures for Federal control of transportation systems for the fiscal year 1920 are based entirely upon appropriations already made and do not include any expenditures that may result from such additional appropriations as may be granted for 1920. The United States Railroad Administration on the date of this report was unable to estimate what additional sums would be expended during the fiscal year 1920, inasmuch as the amounts that will be required are almost entirely dependent upon congressional action in connection with the return of the railroads to private control.

Estimated excess of expenditures over receipts exclusive of public debt, fiscal year 1920	\$705, 072, 729
Estimated excess of total expenditures over total receipts, fiscal year 1920	4, 158, 620, 585

Postal Service.

The Post Office Department estimates that the postal revenues for the fiscal year 1920 will be \$386,600,000, with expenditures for the Postal Service for the same period of \$387,800,000, exclusive of additional compensation to be paid from the general fund of the Treasury.

Fiscal year 1921.

RECEIPTS.

Ordinary receipts:

From customs		\$325, 000, 000
From internal revenue—		
Income and profits taxes	\$3, 000, 000, 000	
Miscellaneous	1, 190, 000, 000	
		4, 190, 000, 000
From sales of public lands		1, 000, 000
From miscellaneous sources		896, 000, 000
Total estimated ordinary receipts		5, 412, 000, 000

Panama Canal:

Estimated receipts from tolls, etc	\$8, 000, 000
--	---------------

Total estimated receipts, exclusive of public debt	5, 420, 000, 000
--	------------------

Public debt:

War-savings certificates	\$175, 000, 000	
Deposits to retire Federal reserve bank notes and national-bank notes	25, 000, 000	
Postal savings bonds	350, 000	
Total estimated public-debt receipts		200, 350, 000
Grand total estimated receipts		5, 620, 350, 000

EXPENDITURES.^{1 2}

For civil establishment:

Legislative establishment	19, 727, 016
Executive proper, including Tariff Commission and Alien Property Custodian	2, 145, 644
State Department	13, 005, 961
Treasury Department proper	130, 880, 000
Public buildings, construction, sites, and equipment	12, 000, 000
War-risk insurance, \$297,649,600, less premium credits, \$100,000,000	197, 649, 600
War Department proper	8, 115, 000
Department of Justice	17, 800, 000
Post Office Department proper	2, 050, 000

¹ Do not include any estimated expenditure on account of increased compensation of Government employees, nor on account of increased compensation in the Postal Service.

² No estimate of expenditures by the United States Railroad Administration for the fiscal year 1921 is included, because on the date of this report the Railroad Administration was unable to make an estimate for that fiscal year, inasmuch as the sums that will be required are almost entirely dependent upon congressional action in connection with the return of the railroads to private control.

Retirement of Federal reserve bank notes and national-bank notes.....	25, 000, 000

¹ The United States Shipping Board states that this estimate does not take into consideration any expenditure from the appropriation of \$280,000,000, which it is estimated will be required for the fiscal year 1921, "if the President and the Congress shall decide that the Shipping Board should go forward and build additional passenger ships and such cargo and tank steamers as may be necessary to make a well-balanced program for a permanent merchant marine."

² Do not include any estimated expenditure on account of increased compensation of Government employees, nor on account of increased compensation in the Postal Service.

³ No estimate of expenditures by the United States Railroad Administration for the fiscal year 1921 is included, because on the date of this report the Railroad Administration was unable to make an estimate for that fiscal year, inasmuch as the sums that will be required are almost entirely dependent upon congressional action in connection with the return of the railroads to private control.

⁴ The Secretary of the Navy states that this estimate does not include any estimated expenditures for new construction.

⁵ Purchases of bonds under authority of sec. 6 of the act of Apr. 4, 1918 (bond purchase fund), are not included as an item of estimated expenditure; this authority expires one year after the termination of the war, and the Secretary reserves decision with respect to such purchases after July 1, 1920.

Public debt—Continued.

Exhibit of appropriations for 1920.

Appropriations made for the fiscal year 1920 and for prior years during the third session of the Sixty-fifth Congress and the first session of the Sixty-sixth Congress, including revised estimated permanent and indefinite appropriations, and appropriations for the Postal Service payable from postal revenues..... \$6,453,984,749.56

Deduct:

Postal Service for 1920 payable from the postal revenues..... \$401,216,149.00

Postal deficiencies of prior years payable from postal revenues..... 7,150,000.00

Deficiencies and supplementals for prior years..... 416,132,241.14

824,498,390.14

Total appropriations for 1920, exclusive of deficiencies and Postal Service payable from postal revenues..... 5,629,486,359.42

Agreeing with the appropriations for 1920 shown in the preceding table, against which the estimates of appropriations submitted for 1921 show a decrease of \$1,451,555,554.80 in the ordinary and \$1,443,290,000.80, including the Panama Canal.

Attention is respectfully called to further divisions of this report, to wit, the condensed annual reports of the various bureaus and divisions of the Treasury Department, and the tables accompanying the report on the finances.

CARTER GLASS,
Secretary.

To the SPEAKER OF THE HOUSE OF REPRESENTATIVES.

ABSTRACTS OF REPORTS OF BUREAUS AND DIVISIONS.

The following is a summary of the reports of the various bureaus and divisions of the Treasury Department:

TREASURER OF THE UNITED STATES.

During the fiscal year 1919 the ordinary receipts were \$4,647,-603,852.46, an increase of \$473,593,266.72 as compared with those of 1918. The ordinary disbursements were \$15,365,362,741.76, an increase of \$6,398,830,475.43 by like comparison. The net result for the year on ordinary account was a deficit of \$10,717,758,889.30.

The disbursements made on account of the Panama Canal during the fiscal year 1919 were \$12,265,775.08, while the receipts from tolls, etc., were \$6,777,046.55. The net excess of disbursements over receipts was \$5,488,728.53, which was paid out of the general fund of the Treasury.

Extraordinary expenditures of public moneys were made during the fiscal year 1919 under provisions of law as follows: Purchase of obligations of foreign Governments engaged in war with the enemies of the United States, \$3,477,850,265.56; and purchase of Federal farm loan bonds, \$96,662,398.59, making a total of \$3,574,512,664.15.

The transactions affecting the principal of the public debt during the fiscal year 1919 are set forth in the statement following:

Receipts on account of—

Postal savings bonds.....	\$289, 260. 00
National-bank notes.....	22, 644, 757. 50

Net excess of receipts.....13,238,410,506.62

The balance in the general fund on June 30, 1919 (on a cash receipt and cash payment basis), was \$1,226,164,935.26. The amount of pay warrants drawn during the fiscal year exceeded the receipts by \$1,059,349,775.36, and \$28,066,895.96 additional warrant payments were made by the Treasurer on account of a reduction of this amount in the warrants outstanding at the close of the fiscal year. The book credits of disbursing officers with the Treasurer, however, were \$628,652,026.37 greater at the close of the fiscal year 1919 than at the close of the previous fiscal year, leaving a net reduction for the fiscal year 1919 of \$458,764,644.95 in the balance in the general fund of \$1,684,929,580.21 on June 30, 1918 (on a cash receipt and cash payment basis).

During the fiscal year 1919 the redemptions from the reserve fund were, in United States notes, \$1,506,000. The redeemed notes were under the provisions of the act of March 14, 1900, immediately exchanged for gold, and thereby the reserve was maintained in volume and character.

The gold in the Treasury at the beginning of the fiscal year 1919 amounted to \$2,479,954,967.09. There was a noticeable monthly increase thereafter until May 15, 1919, when the Treasury holdings of the precious metal attained a maximum at \$2,569,059,633.48. The embargo established over the movement of gold on September 7, 1917, was modified by the Federal Reserve Board, with the approval of the President and the Secretary of the Treasury, on June 9, 1919, after which moderate withdrawals reduced the Treasury holdings to \$2,516,441,004.60 by June 30, 1919. Set apart for the respective uses, it was held on the following accounts: Reserve fund, \$152,979,025.63; trust funds (for redemption of gold certificates in actual circulation), \$735,779,491; gold settlement fund of Federal Reserve Board, \$1,416,086,099.10; and in general fund (belonging to the Treasury), \$211,596,388.87.

The imports of gold during the year were \$62,363,733, the exports \$116,575,535, and the net excess of exports \$54,211,802.

The currency distributed from the Treasury in Washington during the fiscal year 1919 to the subtreasuries, banks, and others amounted to \$492,966,596, a decrease of \$351,448,883 as compared with that of the preceding year.

The balance of public moneys on deposit in designated depositaries at the close of the fiscal year 1919 was as follows:

In Federal land banks.....	\$500,000.00
In Federal reserve banks.....	55,300,485.16
In special depositaries.....	905,411,514.76
In national banks.....	52,399,940.18
In foreign depositaries.....	22,885,165.93
In treasury of Philippine Islands.....	9,313,439.48
Total.....	1,045,810,545.51

The general stock of money in the United States at the close of the fiscal year 1919 amounted to \$7,518,789,000, an increase of \$777,716,706 as compared with that of the preceding year. The growth in subsidiary silver coin was \$11,013,858, in Federal reserve notes \$839,976,540, in Federal reserve bank notes \$172,222,980, while gold decreased \$49,197,748, standard silver dollars \$191,370,171, and national-bank notes \$4,928,753. The money in circulation increased in volume by \$386,602,549 and amounted to \$5,766,029,973 on June 30, 1919. The circulation per capita was \$53.59, and the share of gold to whole circulation 28.48 per cent. Money in circulation includes money in banks, but does not include money held at Federal reserve banks and in Treasury against outstanding issues of Federal reserve notes.

During the fiscal year 1919 the notes and certificates of United States paper currency issued numbered 260,333,387 pieces, of the total value of \$350,138,000. The redemptions were 342,789,832 pieces, of the total value of \$789,735,000. The pieces redeemed were 82,456,445 more than those issued and the amount was \$439,597,000 more than the amount issued during the year. The pieces outstanding number 334,550,753, of the total value of \$2,104,197,685. The average cost of each piece of United States paper currency issued and redeemed is about 1.526 cents, and the annual cost of maintenance of the currency issued by the National Government averages slightly less than one-fifth of 1 per cent of the amount outstanding.

National-bank notes amounting to \$358,427,738.05 were presented for redemption during the fiscal year 1919. This sum represented 51.42 per cent of the average amount in circulation. Of the notes received at the Treasury, \$28,599,350 were fit for use and were returned to the banks of issue for further circulation.

Federal reserve notes amounting to \$183,906,757.50 were presented for redemption during the year, of which \$37,297,650 were fit for use and were returned to banks and agents for further circulation.

Federal reserve bank notes amounting to \$60,722,113.50 were presented for redemption, of which \$2,688,700 were fit for use and were returned to banks of issue for further circulation.

The expenses of redemption have been assessed upon the national and Federal reserve banks.

The Treasurer held in trust at the close of the fiscal year 1919 United States bonds to the amount of \$692,252,950 as security for the circulating notes of national banks. The securities pledged for the safekeeping of public deposits in the depository banks amounted to \$53,720,400. The securities held for the safekeeping of deposits in postal-savings depositories amounted to \$206,830,439.48.

The stock of standard silver dollars in the United States at the beginning of the fiscal year 1919 was \$499,515,930. During the fiscal year the Secretary of the Treasury melted or broke up and sold as bullion, under provisions of the act of April 23, 1918, \$191,369,000 of the standard silver dollars held in the Treasury of the United States. Operations under said act during the past two fiscal years resulted in reducing temporarily the general stock of silver dollars in the country by \$260,121,554. On June 30, 1919, the general stock of silver dollars in the country was \$308,145,759, of which \$80,754,524 were in circulation and \$227,391,235 were held in the Treasury, against which Treasury notes of 1890 and silver certificates to the amount of \$170,893,456 were in circulation. Silver dollars were shipped to depositors therefor at the expense of the consignee for transportation as usual during the past year.

The stock of subsidiary silver coin in the country is \$242,870,438, of which \$231,886,499 was in circulation and the balance, \$10,983,939, was held in the Treasury.

The minor coins are not included in the stated stock of money in the country though in circulation in every section of the several States. Such coins are in great demand and are shipped to depositors therefor at the expense of the consignee for transportation, and they are also paid over the counter at Treasury offices in exchange for other kinds of money.

The trust funds, gold and silver, held to redeem notes and certificates in circulation, at the close of the fiscal year 1919, amounted to \$906,672,947, a decrease of \$501,021,304 as compared with like holdings in 1918. The decrease in gold was \$290,852,178 and in silver \$210,169,126.

The balance in the gold settlement fund July 1, 1918, was \$1,205,082,010. The deposits therein during the fiscal year 1919 were \$835,094,319.43, while the withdrawals were \$624,090,230.33, leaving a balance in said fund of \$1,416,086,099.10 on June 30, 1919.

District of Columbia.

The Treasurer of the United States is ex officio commissioner of the sinking fund of the District of Columbia.

There was issued during the fiscal year 1919 \$2,700 in District of Columbia 3.65 per cent bonds, while the funded debt retired amounted to \$4,750, thus reducing the bonded debt of the District of Columbia to \$5,577,700. A net purchase for the sinking fund of \$835,000 in

United States bonds was made during the year, making a total of \$2,492,500 of such bonds held in trust as an offset against the outstanding debt of the District of Columbia.

There has been no change in the old securities of the District of Columbia held in the care and custody of the Treasurer, and they are as follows: Chesapeake & Ohio Canal bonds, \$84,285, and board of audit certificates, \$20,134.72; while in the District of Columbia contractors' guarantee fund there is also a balance of \$132.51 uncalled for.

COMPTROLLER OF THE CURRENCY.

The national banks of the United States for the fiscal year ended June 30, 1919, embracing five and one-half months of war and six and one-half months of the period of readjustment, have recorded the greatest growth and development ever shown in any year since the inauguration of the national banking system in 1863. The increase in their resources for these twelve months amounted to \$2,960,048,000.

On June 30, 1919, the number of national banks in operation stood at the highest point ever reached—7,824, a net increase of 106 over the number in operation June 29, 1918.

For the fiscal year ended June 30, 1919, only two national banks were placed in charge of receivers, and, of these two, one has already arranged to pay depositors 100 cents on the dollar. This record for immunity from failure is the best recorded in nearly 50 years.

On June 30, 1919, the resources of all national banks were \$20,799,550,000. On June 29, 1918, their resources amounted to \$17,839,502,000. On January 13, 1914, the first call succeeding the approval of the Federal Reserve Act, the resources of the national banks amounted to \$11,296,355,138. On February 27, 1874, the resources of the national banks were \$1,808,500,529; so that in the 40 years from 1874 to 1914 the increase was \$9,487,854,609. The increase in resources from January 13, 1914, to June 30, 1919, was \$9,503,194,862. The national banks have, therefore, grown more in resources in the past five and one-half years than in the preceding 40 years.

The total deposits of national banks on June 30, 1919, amount to \$15,924,865,000, being the greatest amount ever reported and representing an increase over June 29, 1918, of \$1,903,256,000. The total United States Government deposits were \$566,793,000; the net amount due to national banks was \$1,134,918,000; the amount of time deposits reported was \$2,784,940,000; demand deposits, \$9,106,192,000; certified checks, cashier's checks, etc., \$481,952,000.

Loans and discounts on June 30, 1919, amounted to \$10,574,838,000, an increase of \$954,436,000 over June 29, 1918. The ratio of loans to deposits June 30, 1919, was 66.4 per cent against 68.6 per cent on June 29, 1918.

The cash on hand June 30, 1919, including balances due from Federal reserve banks and also including items in process of collection, amount to \$1,920,839,000, being an increase during the year of \$224,-689,000.

The United States Government securities held by the national banks at the close of the fiscal year June 30, 1919, including Liberty bonds, Victory notes, United States certificates of indebtedness and old United States bonds, amounted to \$3,171,912,000, an increase over the amount held June 29, 1918, of \$1,055,127,000. Of the \$3,171,912,000 Government securities owned June 30, 1919, \$1,449,518,000 were Liberty bonds and Victory notes, about \$1,032,444,000 were United States bonds and short-term certificates of indebtedness, and approximately \$689,950,000 were old United States bonds held as a basis for circulation. These figures show that on June 30, 1919, only 6.97 per cent of the total resources of the national banks were invested in Liberty bonds and Victory notes, and they held about 4.96 per cent additional United States securities, exclusive of United States bonds held to secure circulation.

Bonds and securities owned, other than United States Government securities, amounted June 30, 1919, to \$1,767,038,000, an increase over the previous year of \$26,193,000.

The net amount due to national banks from all banks (exclusive of Federal reserve banks) was \$1,581,079,000, an increase of \$118,666,000 since June 29, 1918. The aggregate amount due June 30, 1919, to other banks and bankers (except amounts due to Federal reserve banks) by national banks was \$2,974,076,000, an increase of \$177,-515,000 for the year. Against \$1,839,158,000 which the national banks held on deposit to the credit of the state banks, trust companies, and private bankers, the reports show that national banks had on deposit with State banks, bankers, and trust companies \$375,300,000. The national banks therefore had nearly five times as much money on deposit to the credit of State banking institutions as the national banks were themselves carrying with State banks and trust companies.

The official figures show that national banks are almost universally obtaining their loans, when they have occasion to borrow money, from the Federal reserve banks. The total bills payable and rediscounts outstanding June 30, 1919, amounted to \$1,484,769,000, the bills payable due Federal reserve banks were \$991,117,000, and the bills payable other than those of the Federal reserve banks amounted to only \$58,284,000. Rediscounts, including those with the Federal reserve banks and not included in direct liabilities, amounted to \$435,368,000. The bills payable from the Federal reserve banks arose largely from temporary loans which were secured by Liberty bonds, Victory notes, and United States certificates of indebtedness.

The circulation of national banks outstanding on June 30, 1919, was \$677,162,000, a reduction as compared with June 29, 1918, of \$4,469,000.

On June 30, 1919, the national banks had invested in banking houses, furniture and fixtures, etc., 28.94 per cent of their capital, or 1.55 per cent of their resources.

The capital, surplus, and profits of all the national banks on June 30, 1919, amounted to \$2,363,478,000, the highest figures yet reached, and an increase over June 29, 1918, of \$113,685,000.

The total reserve held June 30, 1919, by all national banks (exclusive of two banks in Alaska and three in Hawaii, nonmembers of the Federal reserve system) amounted to \$1,208,969,000, an excess of \$101,866,000 over the amount required by law. The increase in reserve held as compared with June 29, 1918, was \$79,412,000.

The table following shows the number of national banks reporting to the Comptroller of the Currency June 30, 1919, with their aggregate capital by States and by geographical sections.

Number of national banks and amount of capital stock (in thousands of dollars) as shown by reports of condition on June 30, 1919.

In accordance with the provision of section 333, Revised Statutes United States, which requires the Comptroller of the Currency to incorporate in his annual report to Congress statistics relative to the

condition of banks, other than national, and on account of the uniform courtesy and cooperation extended to his office by the banking departments of the several States, he is enabled to publish each year statistics showing the aggregate resources and liabilities of all reporting banks in the United States, and the table following shows the amount of loans, cash in vault, deposits, and total resources, together with the number of banks reporting on June 30, 1919, in comparison with similar information as of June 29, 1918.

Comparative statement of the number of banks reporting, loans, cash in vault, total deposits, and aggregate resources of all reporting banks in the United States as shown by reports on dates nearest to June 30 for the years 1918 and 1919.

STATE, SAVINGS, AND PRIVATE BANKS, AND LOAN AND TRUST COMPANIES.

Since the inauguration of the national banking system in 1863, there have been issued a total of 11,389 national bank charters.

¹ Rediscounts not included.

Of the 11,389 national bank associations chartered, 552 failed and were placed in charge of receivers; 2,998 have gone into voluntary liquidation; and 15 have been consolidated with other national banks under the act of November 7, 1918. The number of national banks in operation or authorized to do business June 30, 1919, was 7,824.

From the passage of the Federal reserve act, December 23, 1913, to June 30, 1919, the total number of national banks which have been chartered is 920, with an aggregate capital of \$72,529,500. Of these banks, 601 were chartered with a capital of less than \$50,000 each, and aggregate capital of \$15,684,500; and 319 with individual capital of \$50,000 or more, the aggregate capital of such banks being \$56,845,000.

Of the 189 national banks which were chartered during the past fiscal year, 69 succeeded State banks and trust companies, 52 represented conversions, and 17 reorganizations of State and private banks and 120 banks of primary organization.

The capital of the new national banks chartered during the year amounted to \$16,080,000. Of the banks chartered during this period, 120 had individual capital of less than \$50,000 each, the aggregate being \$3,110,000 and the average per bank \$25,917. Sixty-nine banks having aggregate capital of \$12,970,000 were organized, with individual capital of \$50,000 or more, the average capital per bank being \$187,971. One hundred and thirty-nine of the 189 banks organized during the year had not, up to June 30, taken out circulation.

To meet the demands for additional capital during the past year, 224 existing national banks increased their capital in the aggregate \$27,464,100. This compares with increases in the previous year of \$16,150,000, in which 164 banks participated. Only 4 banks reduced their capital during the past year, the aggregate reduction being only \$210,000. In 1918, 6 national banks reduced their capitalization, the total reduction being \$277,800.

During the fiscal year ended June 30, 1919, 66 national banks went into voluntary liquidation, including 3 banks the corporate, existence of which expired by legal limitation. Of the 66 voluntarily liquidating, 10 with an aggregate capital of \$2,680,000 were consolidated with other national banks; 6 with an aggregate capital of \$300,000 went out of business; and 50 with an aggregate capital of \$12,860,000 were absorbed by or reorganized as State banks.

The table following shows the total number of national banks organized up to June 30, 1919, by States and geographical divisions, also the number of national banks which have become insolvent, the number of voluntary liquidations, and the number of banks in operation or authorized to begin business in each State on the date mentioned.

Number of national banks organized, insolvent, in voluntary liquidation, and in operation, as shown by records in the Currency Bureau on June 30, 1919.

¹ Exclusive of 37 banks which were restored to solvency.

² Includes 15 banks consolidated with other national banks under the act of Nov. 7, 1918.

Prior to the approval, on November 7, 1918, of the act providing for the consolidation of national banks, the only method by which two national banks could be amalgamated was by the liquidation of one of the associations and the purchase or acquisition by agreement of its business by the other. The consolidation act provides that any two or more national banking associations located in the same village, town, city, or county may be consolidated into one as ociation under the charter of either of the existing banks on such terms and conditions as may be agreed upon by the majority of the board of directors of each association, when ratified and confirmed by shareholders representing at least two-thirds of the stock, and approved by the Comptroller of the Currency.

Under authority of this act up to and including September 30, 1919, 22 consolidations were effected involving 46 banks with combined capital of \$28,070,000. The capital of these banks after consolidation was \$28,525,000, hence an increase of \$455,000 in the capitalization. In two instances 3 banks were parties to the consoli-

dation, while in each of the other twenty cases but 2 banks were concerned.

The aggregate capital stock of the 2 national banks that have been placed in charge of receivers during the past fiscal year amounted to \$225,000, with aggregate liabilities to depositors and other creditors at the date of suspension of \$2,382,224. One of these two banks, however, has already paid depositors in full, leaving but one bank failure in the fiscal year from which the creditors may suffer loss.

The record shows that of the national banks which have failed since February, 1914, approximately 60 per cent have been either restored to solvency or have paid their depositors 100 cents on the dollar, or are expected to do so, whereas in the nearly fifty-year period prior to 1914 only about 35 per cent of the failed banks were restored to solvency or paid their depositors in full.

For the period of nearly two years from January 1, 1918, to November 1, 1919, covering over ten months of war and nearly twelve months of readjustment, only two small national banks out of nearly 8,000 were placed in charge of receivers, an average of one failure each eleven months. In the 25-year period prior to 1914, national bank failures averaged about eighteen per annum, or one in about every 20 days.

The records show the average number of national bank receiverships per annum per thousand operated banks for the twenty-five years prior to 1914 was more than twenty times, or 2,000 per cent, greater than the average number of such failures per thousand banks for the critical period which has elapsed since January 1, 1918.

This extraordinary reduction in national bank failures and in loss to depositors has resulted from the admirable operations of our new financial and banking system; from the greater thoroughness in the examinations of banks; and from the insistence that national banks shall observe the provisions of the National Bank Act, shall conform to the ethics of sound banking, and shall comply with the regulations promulgated by the Comptroller's bureau for the protection and preservation of the interests of the banks' depositors and shareholders.

MINT SERVICE.

Operations of the Mints and Assay Offices.

During the fiscal year 1919 the demands for coin of denominations below the dollar continued to be very large as compared with the period before the war. The demand for 1-cent pieces was the largest ever known and our presses were run 24 hours a day on this coin for months; 466,839,600 1-cent pieces were issued by the mints during the year. This demand was doubtless due principally to putting into effect certain internal-revenue taxes. The domestic coinage of 434,028,458 pieces has been exceeded only by the coinage of the preceding year; and the coinage for foreign governments amounted to 103,114,195 pieces as compared with 52,748,341 pieces during 1918.

The melting of silver dollars for use as bullion was continued through nearly the entire fiscal year, the operation incident to sale of 200,000,000 fine ounces of silver to the Government of Great Britain for use by the Government of India being completed in May, 1919. Over 191,000,000 dollars were melted during the year, giving total melted under the act of April 23, 1918, of 260, 121, 554 silver dollars.

An event of the year of more than passing importance to the Mint Service was the commencement of work on the new assay office building at New York. The work of the office has been hampered for many years by inadequate and unsuitable quarters, but it is expected that by the close of another fiscal year this will have ended and that the office will be suitably housed, with adequate storage vaults for the large values there kept.

Platinum work—its purchase, refining and manufacture into various shapes for the War Department—continued to be an important feature at the New York assay office during most of the fiscal year.

The technically and practically difficult task of originating and operating assaying and refining processes for platinum and allied metals, begun in the prior fiscal year, was finished this year with results which reflect great credit on the staff of the institution.

The mint service institutions operated during the fiscal year were: Coinage mints at Philadelphia, San Francisco and Denver; assay office at New York, which has a large trade in bars of fine gold and silver; mints at New Orleans and Carson City conducted as assay offices and assay offices at Seattle, Boise, Helena, Salt Lake City, and Deadwood, these being bullion purchasing agencies for the large institutions. Refineries were operated at the New York, Denver, and San Francisco institutions.

The value of the gold acquired by the Government at the mints and assay offices during the fiscal year 1919 was \$126,841,719.19; United States gold coin received for recoinage was of value \$24,521,644.12; transfers of gold between Mint Service offices totaled \$8,978,669.39; making an aggregate of gold handled by the Mint Service during the fiscal year 1919 of \$160,342,032.70.

Silver purchased during the fiscal year 1919 totaled 9,122,029.99 fine ounces, costing \$9,120,806.80, at an average price of \$1.00—per fine ounce; the silver received and repaid to the depositors thereof in bars bearing the Government stamp totaled 439,387.63 fine ounces; the United States silver coin received for recoinage totaled 456,831.78 fine ounces, with recoinage value of \$631,528.29; silver dollars aggregating 116,538,397.85 fine ounces, having a face value of \$151,-569,000, were received from other Treasury offices for melting; Philippine silver coins received for recoinage totaled 617,755 fine ounces; silver deposited in trust by other governments totaled 724,962.41 fine ounces; the transfers of silver between Mint Service offices totaled 3,081,897.57 fine ounces, making an aggregate quantity

of silver handled by the mint service during the fiscal year 1919 of 130,981,262.23 fine ounces. This is about two and two-thirds times the quantity handled last year, the large increase being due to the melting of silver dollars.

The domestic coinage of the fiscal year 1919 was of value \$19,570,657, namely \$14,682,079 subsidiary silver, \$1,457,875 nickel, and \$3,430,703 bronze coin. No gold domestic coin was made.

The coinage other than domestic included 29,195 gold 1-pound blanks for Peru; 13,750,000 nickel pieces and 7,000,000 bronze pieces for Peru; 47,595,000 nickel pieces for Argentina; 100,000 nickel pieces and 750,000 bronze pieces for Nicaragua; and 13,175,000 bronze pieces for Siam, all made at the Philadelphia mint; also Philippine coin made at the San Francisco mint consisting of 11,115,000 silver pieces, 2,000,000 nickel pieces and 7,600,000 bronze pieces.

The seigniorage on United States coinage executed totaled \$8,369,971.01, of which \$4,233,193.43 was on subsidiary silver coins and \$4,136,777.58 was on nickel and bronze coins.

Stock of coin and bullion in the United States.

On June 30, 1919, the estimated stock of domestic coin in the United States was \$1,773,839,984, of which \$1,222,823,787 was gold, \$308,145,759 was silver dollar coin, and \$242,870,438 was subsidiary silver coin.

The stock of gold bullion in the mints and assay offices on the same date was valued at \$1,802,850,973.72, an increase over last year of \$64,291,821.57, and the stock of silver bullion was 17,486,379.70 fine ounces, an increase over last year of 2,590,468.91 fine ounces.

Production of gold and silver.

The production of gold and silver in the United States during the calendar year 1918 was as follows: Gold, \$68,646,700; and silver, 67,810,139 fine ounces.

Industrial arts.

The amount of gold consumed in the industrial arts during the calendar year 1918 was \$52,409,740, of which \$32,892,395 was new material. Silver consumed amounted to 36,252,596 fine ounces, of which 26,722,333 fine ounces were new material.

Export of gold coin.

The net export of United States gold coin for the fiscal year ended June 30, 1919, was \$85,625,872.

Appropriations, expenses, and income.

The appropriated amounts available for Mint Service use during the fiscal year 1919 totaled \$1,778,420.38; reimbursements to appropriations for services rendered amounted to \$522,626.43; making an available total of \$2,301,046.81.

The expenses chargeable to appropriations were \$2,070,052.64; those chargeable to income, \$74,360.51; total, \$2,144,413.15.

The income realized by the Treasury from the Mint Service totaled \$11,849,583.21 of which \$8,371,202.33 was seigniorage; \$2,516,425.05 was received for melting silver dollars and is held to cover the loss by abrasion and the cost of recoinng silver dollars.

Income and expenses are itemized as follows:

INCOME.	
Earnings:	
Credited to appropriations—	
Charges on foreign coinage executed.....	\$326, 726.18
Charges for manufacture of special medals.....	4, 489.33
Charges for work done for other institutions, etc.....	42, 060.17
Charges for melting silver dollars.....	149, 350.75
Total earnings credited to appropriations.....	\$522, 626.43
Credited to revenues—	
Mint charges on bullion.....	299, 204.06
Proceeds of medals and proof coins sold.....	4, 408.93
Receipts from special assays of bullion and ores.....	3, 127.00
Charges on silver-dollar bullion sold.....	2, 516, 425.05
Total earnings credited to revenues.....	2, 823, 165.04
Total earnings.....	\$3, 345, 791.47
Profits:	
Gain on bullion shipments to refineries.....	\$3, 129.33
Less contra losses.....	590.02
Surplus bullion recovered.....	\$2, 539.31
Proceeds of sale of by-products (platinum, etc.).....	123, 694.27
Proceeds of sale of old materials.....	2, 998.24
Excess cash.....	3, 344.11
Commission on telephone calls.....	12.26
Commission on telephone calls.....	1.22
Total profits other than seigniorage.....	132, 589.41
Seigniorage on subsidiary silver coinage.....	4, 233, 193.43
Seigniorage on minor coinage—	
Nickel.....	1, 233, 358.10
Bronze.....	2, 904, 650.80
Total seigniorage.....	8, 371, 202.33
Total profits.....	8, 503, 791.74
Total income.....	11, 849, 583.21

EXPENSES.

Chargeable to appropriations:

Compensation of employees—

Mint Bureau, salaries appropriation.....	\$23, 645. 00
Mint Bureau, increase compensation appropriation.....	1, 317. 00
Mints and assay offices, salaries appropriations.....	240, 882. 37
Mints and assay offices, wages appropriations.....	1, 110, 476. 70
Mints and assay offices, increase compensation appropriation...	106, 169. 71
Total compensation of employees.....	\$1, 482, 490. 78

Equipment, stores, and other expenses—

Mint Bureau, contingent appropriation.....	5, 044. 19
Mints and assay offices, contingent and permanent appropriations (including \$8,406.60 wastage of gold and silver in operative departments, and \$9,535.79 loss on assay value of operative sweeps sold).....	574, 237. 91
Transportation of bullion and coin between mints and assay offices, freight appropriation...	8, 279. 76

Total miscellaneous expenses chargeable to appropriations 587, 561. 86

Total expenses chargeable to appropriations..... \$2, 070, 052. 64

Chargeable to revenue:

Seigniorage on minor coinage—

Expenses of distributing minor coin to Treasury offices.....	69, 002. 35
Wastage of minor metals in operative departments.....	5, 358. 16

Total chargeable to revenue..... 74, 360. 51

Total expenses..... 2, 144, 413. 15

Net income of the Government from the Mint Service..... ¹ 9, 705, 170. 06

Total..... 11, 849, 583. 21

¹ Includes \$2,516,425.05 received for melting silver dollars and held to cover the loss by abrasion and the cost of recoinage.

Deposits, income, expenses, and employees, by institutions, fiscal year 1919.

The number and value of deposits, the income (including seigniorage), the expenses of the fiscal year 1919, and the number of employees on June 30, 1919, at each institution, follow:

Institution.	Number of—		United States coin value of gold and silver received at each institution.	Income.	Expenses from appropriations. ¹	Trans- porta- tion of bullion and coin.	Em- ployees June 30, 1919.

BUREAU OF INTERNAL REVENUE.¹

The receipts from internal-revenue taxes for the fiscal year 1919 were as follows:

Income and profits tax.....	\$2,600,783,902.70	
Miscellaneous taxes.....	1,249,366,175.86	
		\$3,850,150,078.56
Fiscal year 1918:		
Income and profits tax.....	2,839,027,938.57	
Miscellaneous taxes.....	859,927,882.36	
		3,698,955,820.93
Net increase over 1918.....		151,194,257.63

The following comparative statement shows in greater detail the internal-revenue receipts for the fiscal years 1918 and 1919.

¹ The figures mentioned in this abstract differ from the figures carried in the financial statements of internal-revenue receipts because they represent collections by internal-revenue officers throughout the country, whereas the latter represent the deposit of these collections in the Treasury or depositaries during the fiscal year concerned, the difference being due to the fact that some of the collections in the latter part of the fiscal year can not be deposited, or are not reported to the Treasury as deposited, until after June 30, thus carrying them into the following fiscal year as recorded in the financial statements.

Total receipts from all sources.....	3,698,955,820.93	3,850,150,078.56	+ 151,194,257.63

¹ Includes \$13,296,927.32 from "Munition manufacturers' tax," which was repealed by the Revenue Act of 1917, effective Jan. 1, 1918.

Revenue Act of 1918.

The Revenue Act of 1918, approved February 24, 1919, provided for the raising of approximately \$10,000,000,000 during the first 24 months of operation through substantial increases in the rates provided by previous legislation and through the addition of a number of new objects of taxation. In the brief period remaining after the passage of the act before the close of the fiscal year, regulations and instructions for carrying out the provisions of the new legislation were prepared and issued and an extraordinary effort was made to secure the filing of returns of floor taxes which were assessable immediately after the passage of the act, and to care for the prompt handling of more than 4,000,000 returns of income and profits, together with the first quarterly installment of the tax due in connection with these returns on March 15.

Cost of administration.

The cost of administering the internal-revenue laws for the fiscal year 1919 aggregated \$20,573,771.52, or 0.534 per cent of the total collections, compared with \$12,003,214.07 for the fiscal year 1918, representing 0.325 per cent of the collections during that year.

During the fiscal year very large expenditures were made in connection with the assessment of income and profits taxes under the Revenue Act of 1918, although the collections from these assessments are payable, under the installment plan, partly in the fiscal year 1919 and partly in the fiscal year 1920. The increase in the ratio is due in part, also, to the expansion of the organization for the purpose of investigating and auditing the accumulation of income and profits tax cases for prior years as well as for the current year, and to expenditures for the administration of the child-labor tax law and other revenue measures under which collections are disproportionately low. The cost of collecting internal revenue under purely revenue laws can no longer be accurately measured by the cost of administration.

Income and profits taxes.

The collections of income and profits taxes during the year amounted to \$2,600,783,902.70, or \$238,244,035.87 less than the collections during the preceding fiscal year from similar sources. The decrease resulted from the provision in the Revenue Act approved February 24, 1919, for the payment of income and profits taxes in four quarterly installments, only two of which fell within the fiscal year. Under assessments made during the fiscal year the total amount of collections of taxes based on income arising in the calendar year 1918 will be augmented by approximately \$2,000,000,000, which will be included in the receipts of the fiscal year 1920. The number of income and profits tax returns filed under the Revenue Act of 1918 was more than 4,000,000, compared with less than 3,500,000 the year before. The problem of verifying and auditing this vast number of returns and preparing to handle expeditiously a similar task which will recur each year is being solved by the gradual recruitment and training of a large staff of competent auditors at Washington and by gradually assigning to the collectors of internal revenue throughout the country the handling of the various classes of cases arising in their districts as rapidly as the organization under each collector can be perfected and expanded. During the past year all returns of individuals having incomes of less than \$5,000 were retained by the collectors for a preliminary audit, which resulted in the early correction of many errors and left the organization at Washington free to devote attention exclusively to the larger and more difficult cases.

The Revenue Act of 1918 included a number of provisions for the adjustment of inequalities and inequities which had been found to arise under the operation of the Revenue Act of 1917. The interpretation and administration of these provisions necessarily complicated the handling of cases to which these provisions were found to apply.

In the expectation that a large number of claims would be filed under these relief provisions, Congress provided for the creation of the Advisory Tax Board, which was established on March 13, 1919, and discontinued October 1, 1919, after having rendered invaluable service in the framing of regulations, the hearing of appeals, and the disposition of difficult cases arising under the income and profits tax laws. In place of the Advisory Tax Board a unit of bureau experts, with appellate functions, has been created to continue the work of the board in hearing appeals presented by taxpayers.

Estate tax.

The Revenue Act of 1918 made extensive changes in the former acts providing for a tax on the net estate of decedents. The rate of tax on estates less than \$1,500,000 has been reduced, exemption has been provided for the estates of persons dying while actually serving in the military or naval forces, deductions are allowed of all bequests or gifts to the United States or any State, Territory, or political subdivision, or to eleemosynary and certain other institutions. The amount of tax collected during the year, however, aggregated \$82,029,983.13, compared with \$47,452,879.78 the preceding year.

Capital-stock tax.

The rate of tax on the capital stock of corporations was increased by the Revenue Act of 1918 from 50 cents to \$1 for each \$1,000 of the full value of the capital stock, and the amount exempt from tax was reduced from \$99,000 to \$5,000. As a result of these and other changes in the law, the number of taxable corporations was increased from 65,000 to 350,000. The full effect of the change in the annual rate of collections is not reflected in the collections which were made before the close of the fiscal year, amounting to \$28,775,749.66, compared with \$24,996,204.54 the year before.

Child-labor tax law.

The child-labor tax law, which became effective on April 25, 1919, under legislation included in the Revenue Act of 1918, received special attention during the brief period remaining before the close of the fiscal year. Information regarding the requirements of the law was widely disseminated and appropriate instructions issued to all field officers of the Internal Revenue Service. A special division was organized in the bureau at Washington, which has established the procedure by which employers may present satisfactory evidence of the ages of minor employees. No tax has as yet been found to be collectible under this law and employers generally have manifested a

gratifying disposition to cooperate with the revenue officers in securing the observance of the standards of taxability prescribed by the law.

Taxes on sales, special and miscellaneous commodities, occupations, and admissions and dues.

As the result of the improvement of administrative procedure under the provisions of the Revenue Act of 1917 providing taxes on sales of certain commodities by manufacturers and dealers and on transportation, insurance, admissions and dues, and certain occupations, as well as changes in the Revenue Act of 1918 affecting these objects of taxation, it has been found necessary to create a special administrative unit to give attention to the assessment and collection of taxes under these various classifications. During the year the collections from the transportation tax aggregated \$237,839,572.30, compared with \$70,736,550.01 in the preceding fiscal year. The excise taxes on the sales by manufacturers, producers, and importers of automobiles, motor cycles, and certain other commodities yielded \$82,424,873.83, compared with \$39,068,687.10 in 1918. The excise taxes on sales by dealers of certain works of art, carpets, picture frames, wearing apparel, perfumes and cosmetics, soft drinks, ice cream, and other commodities amounted to \$6,147,269.45, compared with \$993,477.72 in 1918. The collection of taxes on various occupations and on admissions and dues amounted to \$4,721,298.16 and \$54,992,157.01, respectively, compared with \$2,691,586.87 and \$28,616,395.37, respectively, in 1918.

Distilled spirits.

During the fiscal year ended June 30, 1919, there were produced from materials other than fruit 98,976,118.3 taxable gallons of distilled spirits, a decrease of 74,500,355.4 gallons compared with the quantity of like spirits produced during the preceding fiscal year.

Of this class of spirits there were removed from bonded warehouses, on payment of tax, 81,598,086.5 taxable gallons, a decrease of 6,189,737.0 taxable gallons from the quantity tax paid during the preceding fiscal year. This decrease in the quantity of spirits tax paid resulted from the extension of prohibition to several States during the year, and from the increase in the rate of tax to \$6.40 a proof gallon on spirits intended for beverage purposes.

The quantity of spirits remaining in distillery and general bonded warehouses at the close of the fiscal year 1919 was 72,358,151.1 gallons, a decrease of 86,601,113.4 gallons from the quantity—158,959,264.5 gallons—so held in bond at the close of the preceding fiscal year.

A large decrease in production of spirits and in the use of denatured alcohol during the year resulted from the greatly reduced demand at the close of the war for alcohol to be used in the manufacture of munitions for the United States Government as well as for the allies. Nor were any spirits produced during the year for beverage purposes, such production being prohibited by the act of August 10, 1917. Nevertheless, the protection and disposition of this vast quantity of liquors involves serious administrative problems. These spirits may be withdrawn for export or for use for nonbeverage purposes, but the demand in these directions is relatively small, and it appears probable that on January 16, 1920, when permanent prohibition becomes effective, at least 50,000,000 gallons will still remain in the bonded warehouses.

Denatured alcohol.

During the fiscal year 1919 there were withdrawn from bond free of tax, for denaturation, 60,399,308.9 proof gallons of alcohol and rum, against 90,644,722.8 proof gallons withdrawn for this purpose during the previous year.

Industrial distilleries.

During the fiscal year 1919, 208 industrial distilleries were established under the act of October 3, 1913. This act by authorizing greater freedom in registration and conduct of distilling operations sought to encourage the production of alcohol from the waste products of farms. Under the act of October 3, 1917, fermented malt liquors were authorized to be used as distilling material at industrial distilleries contiguous to brewery premises in the production of alcohol for denaturation. Many of the industrial distilleries formerly operated as breweries qualified during the past year and were converted into industrial distilleries in order to permit, in the course of manufacture of cereal beverages, the fermenting of material containing one-half of 1 per cent or more of alcohol—the finished product, however, to contain less than one-half of 1 per cent alcohol by volume.

Distilleries.

In addition to industrial distilleries operating under the act of October 3, 1913, there were engaged in the production of distilled spirits, at the close of the fiscal year, 13 grain distilleries, 23 molasses distilleries, and 38 fruit distilleries—a total of 74, compared with 236 in 1918. Supervision over all establishments engaged in the manufacture, rectification, and sale of distilled spirits is maintained through the field officers of the Internal Revenue Service. For the sale or use of distilled spirits for other than beverage purposes 31,880 permits were issued.

Fermented liquors.

The number of operating breweries decreased during the fiscal year 1919, the number of going concerns at the close of the year being 669, or 423 less than in 1918. The output of breweries during the past year aggregated 27,712,648 barrels, a decrease of 22,553,568 barrels from the production in 1918.

Wines and cordials.

Revenue from taxes on wines and cordials during the fiscal year ended June 30, 1919, amounted to \$10,521,609.14, compared with \$9,124,368.56 in 1918 and \$5,164,075.03 in 1917. The total production was 55,756,171 gallons for the fiscal year, of which 48,153,437 gallons had not over 14 per cent alcoholic content and 7,602,734 gallons had over 14 per cent but not over 24 per cent alcoholic content. On June 30, 1919, there were 17,521,147 gallons of wine on hand, compared with 47,159,384 gallons on hand June 30, 1918.

Prohibition enforcement

The prohibition-enforcement act places in the Bureau of Internal Revenue and the Department of Justice the important responsibility for the enforcement of prohibition. This work is essentially unrelated to the collection of taxes, which is the function of the bureau, and both the Secretary of the Treasury and the Commissioner urged that this important responsibility should not be imposed on the Treasury Department, which is already burdened with the fiscal and revenue problems of the Government. However, the Congress, evidently considering the similarity of some phases of the work of internal-revenue agents in the field, who are assigned to secure evidence and aid in the prosecution of persons who have evaded the taxes imposed by law on the manufacture and sale of alcohol beverages, with the police function of prohibition enforcement officers, has directed the Bureau of Internal Revenue to undertake, in addition to its functions as a tax-gathering agency, the enforcement of the prohibition law. Accordingly a separate and distinct organization within the Bureau of Internal Revenue will be created for this purpose.

Not to enforce prohibition thoroughly and effectively would reflect upon the Government and would bring into disrepute the reputation of the American people as law-abiding citizens. No law can be effectively enforced except with the assistance and cooperation of the law-abiding element. The bureau will accordingly put into operation at once the necessary organization to cooperate with the States

and the public in the rigid enforcement of the prohibition law, and appeals to every law-abiding citizen for support.

The bureau expects unreserved cooperation from those moral agencies which are so vitally interested in the proper administration of this law. Such agencies include churches, civic organizations, educational societies, charitable and philanthropic societies, and other welfare bodies. The bureau expects also cooperation and support from all citizens of the United States who may have opposed the adoption of the constitutional amendment and the law which make unlawful certain acts and privileges which were formerly not unlawful. Regardless of personal conviction, it is the right of the Government officers charged with the enforcement of this law to expect the assistance and moral support of every citizen in upholding the law.

The Bureau of Internal Revenue undertakes the task intrusted to it with a sense of assurance prompted by the same abiding faith in the American people that enabled it to appeal successfully to them for cooperation in the enforcement of the war-revenue laws. The people have so loyally responded to their heavy tax obligations that there is no reason to doubt that they will respond with equal loyalty to the efforts which the bureau will make in good faith to enlist the cooperation of citizens in the enforcement of the measure which, like the income tax, is now a part of the Constitution of the United States. The adequate and impartial enforcement of prohibition will sustain the majesty of the law and the honor of American citizens and American institutions.

BUREAU OF WAR RISK INSURANCE.

The following tables indicate the operation of the Bureau of War Risk Insurance during the fiscal year ended June 30, 1919, and show that a vast number of claims have been received and disposed of in that period. It is interesting to note that in the Marine and Seamen's Division the operations have resulted in a profit over losses incurred of about \$17,000,000, while in the Military and Naval Division the cost to the Government of insurance of soldiers and sailors in the active service over the premiums paid by the men was in excess of \$700,000,000.

Marine and seamen's insurance.

The writing of marine and seamen's insurance was suspended on January 4, 1919. Between July 1, 1918, and January 4, 1919, approximately one-third of the total insurance on hulls, cargoes, and freight was written, and during the same period five-sixths of the total insurance on the lives of seamen was written.

Since January 4, 1919, the bureau's activities in marine and seamen's insurance have been directed toward the settlement of all outstanding claims.

TABLE I.—*Statement of policies written for insurance on hulls, cargoes, and freight for the fiscal year ended June 30, 1919.*

Total number of policies issued.....	10, 034
Gross amount written.....	\$838, 724, 776
Cancellations.....	16, 283, 898
Net amount written.....	\$822, 440, 878
Net amount at risk July 1, 1918.....	\$115, 664, 225

TABLE II.—*Statement of premiums for insurance on hulls, cargoes, and freight for the fiscal year ended June 30, 1919.*

Gross premiums received.....	\$4, 043, 954. 63
Premiums refunded.....	483, 315. 87

Military and naval allotments and family allowances.

During the fiscal year the peak of the payments for military and naval allotments and family allowances was reached.

Approximately 645,000 awards were active at the end of the fiscal year, June 30, 1919. In December, 1918, the active cases numbered more than 1,544,000. The transactions in detail are shown in the following tables.

TABLE I.—*Allotments and family allowances, applications, exemption claims, and award for the fiscal year ended June 30, 1919.*

Applications received from men having dependent relatives.....	1, 858, 613

MILITARY AND NAVAL COMPENSATION.

Compensation is payable for death or for disability incurred while in the military or naval service, in addition to war risk insurance. Every notice of death or disability received from the War or Navy Department is therefore considered as a claim, and an investigation is made to determine whether or not compensation is payable. When the men are detached from the service they undergo a thorough medical examination. The bureau is furnished with copies of these medical examinations whenever they are needed in connection with claims.

The following table shows the number of claims on hand at the beginning of the year, those received during the year, and the disposition of both.

TABLE I.—*Statement of number of claims for military and naval compensation due to death or disability of men in the service for the fiscal year ended June 30, 1919.*

Claims pending at the end of previous fiscal year.....	10, 255	
Claims received during the fiscal year (death and disability).....	223, 167	
Total.....		233, 422
Claims allowed for compensation for death.....	23, 805	
Claims allowed for compensation for disability.....	31, 785	
Total claims allowed.....		55, 590
Claims withdrawn—death.....	12, 760	
Claims withdrawn—disability.....	2, 668	
Total claims withdrawn.....		15, 428
Claims disallowed—death.....	41, 099	
Claims disallowed—disability.....	2, 055	
Total claims disallowed.....		43, 154
Total claims disposed of.....		114, 172
Pending at end of year.....		119, 250

Many of the claims listed above as "pending" are not claims in the true sense. The notifications of death and disability are forwarded by the Army and Navy and are all treated as claims. In many cases it is found that there are no relatives entitled to receive the benefits of military and naval compensation. All such cases are thoroughly investigated and are considered as pending claims during this period of investigation. Claims in which the degree of the disability or the dependency is questionable may be allowed to remain pending, since, under the act, it is permissible to complete at a later date the proof of disability or of dependency. In many instances the degree of the disability may become such that there is no question that the case is compensable. In death cases compensation is payable, provided the dependency of the father or mother, or both, arises and claim is made within five years after the death of the person in the service.

The following tables show the details of the military and naval compensation awards on account of death or disability.

TABLE II.—*Statement of number of claims for military and naval compensation, due to death of men in the service, awarded in the fiscal year ended June 30, 1919.*

Whenever possible disabled men, to whom it is necessary to furnish hospital treatment, are sent to hospitals maintained by the United States Public Health Service. When men can not be moved or when private institutions offer better facilities, use is made of hospitals other than those maintained by the Government.

The following tables show the number of cases treated under the direction of the Bureau:

TABLE VII.—*Cases treated in the United States Public Health Service hospitals, distributed by nature of disease, fiscal year ended June 30, 1919.*

	Admissions.	Discharges.	Remaining for treatment.
General diseases.....	2,902	2,152	750
Neuro-psychiatric.....	430	227	203
Tuberculosis.....	1,529	802	667
Total for all diseases.....	4,861	3,241	1,620

Cases treated in hospitals other than those of the Public Health Service, distributed by nature of disease, fiscal year ended June 30, 1919.

	Admissions.	Discharges.	Remaining for treatment.
General diseases.....	344	230	114
Neuro-psychiatric.....	1,349	517	850
Tuberculosis.....	1,424	729	695
Total for all diseases.....	3,117	1,476	1,659

Cases treated in all hospitals, distributed by nature of disease, fiscal year ended June 30, 1919.

	Admissions.	Discharges.	Remaining for treatment.
General diseases.....	3,246	2,382	864
Neuro-psychiatric.....	1,779	744	1,053
Tuberculosis.....	2,953	1,591	1,362
Total for all diseases.....	7,978	4,717	3,279

The rate of expenditures from the appropriations for "Military and naval compensation" has increased very rapidly during the year.

The following table shows the expenditures by months:

TABLE VIII.—*Statement of appropriation and expenditures "Military and naval compensation" from July 1, 1918, to June 30, 1919.*

Month.	Total appropriation to July 1, 1918.	Expenditures.	Accumulated expenditures.	Unexpended balance.
Period ending June 30, 1918.....	\$12,150,000		\$341,365.27	\$11,808,634.73
July, 1918.....		\$210,441.62	\$210,441.62	11,598,193.11
August, 1918.....		259,444.92	469,886.54	11,338,748.19
September, 1918.....		265,103.89	734,990.43	11,073,644.30
October, 1918.....		363,872.26	1,098,862.69	10,709,772.04
November, 1918.....		398,393.71	1,497,256.40	10,311,378.33
December, 1918.....		476,794.29	1,974,050.69	9,834,584.04
January, 1919.....		670,118.10	2,644,168.79	9,164,465.94
February, 1919.....		1,065,827.51	3,709,996.30	8,098,638.43
March, 1919.....		1,309,937.13	5,019,933.43	6,788,701.30
April, 1919.....		1,995,008.09	7,014,941.52	4,793,693.21
May, 1919.....		1,959,751.87	8,974,693.39	2,833,941.34
June, 1919.....		2,326,649.26	11,301,342.65	507,292.08

The following table shows the detail of expenditures during fiscal year, 1919.

TABLE IX.—*Statement of appropriation for military and naval compensation, fiscal year 1919.*

Balance June 30, 1918.....	\$11, 808, 634. 73
Expenditures:	
Monthly awards.....	\$9, 370, 932. 15
Physical examinations.....	6, 559. 21
Hospital services.....	298, 408. 72
Medical and surgical services.....	20, 133. 32
Traveling expenses.....	9, 791. 01
Transportation.....	50, 085. 31
Supplies.....	17, 147. 61
Burial expenses.....	1, 528, 285. 32
Total.....	11, 301, 342. 65
Unexpended balance, June 30, 1919.....	507, 292. 08

Military and naval insurance.

Automatic insurance is the protection against death or total permanent disability afforded by the Government to the amount of \$4,500 for men who died or became totally permanently disabled in the active service in the period from April 6, 1917, to February 12, 1918. All the men in the service were given to February 12, 1918, or until 120 days after enlistment to apply for contract insurance. The law was later amended to allow them until April 12, 1918, or until 120 days after enlistment in which to apply for contract insurance. Contract insurance is issued in multiples of \$500 with a minimum amount of \$1,000 and a maximum amount of \$10,000. The total cost of automatic insurance is borne by the taxpayer. Under contract insurance the insured pays the normal peace-time cost of insurance; the expense of administration and the excess cost due to the war is borne by the Government. Because of the fundamental difference between contract and automatic insurance a separation of the number of cases under each is made in the following tables.

It was during the past fiscal year that the largest number of death claims for insurance were received by the bureau and were disposed of. Permanent total disability claims for insurance began to come in more rapidly during the latter part of the fiscal year, and the bureau is at present concerned with their investigation and in making awards.

Table I is an analysis of the disposition of the claims due to death and permanent total disability which have been received by the bureau. It indicates, in addition to the number of cases which have not been allowed or disallowed, the number of cases upon which payments are not being made, and the reasons therefor, where investigations are completed.

TABLE I.—*Statement of number of military and naval insurance claims due to death of disability for the period Oct. 6, 1917, to June 30, 1919.*

Claims received.....	117,885
Claims allowed.....	105,050
Automatic insurance:	
No payments being made—	
No relatives entitled to benefits.....	527
No payments being made—	
Awardee alien enemy.....	6
No valid claim existing under law.....	79
Total.....	612
Contract insurance:	
No payments being made—	
No relatives entitled to benefits.....	263
No payments being made—	
Awardee alien enemy.....	6
No valid claim existing under law.....	122
Total.....	391
Total automatic and contract insurance claims disposed of.....	106,053
Claims pending.....	11,832

Tables II, III, and IV make comparisons between the number of cases for contract and automatic insurance, amounts of insurance, and amount of monthly payments awarded during the fiscal year 1918, and during the fiscal year 1919. They also give the total number of claims for death and disability upon which there are awards actively running on June 30, 1919. When the beneficiary dies the payment of the award must at least be temporarily suspended until the next beneficiary is located. If there is no other relative within the permitted class, then the award must be permanently terminated.

TABLE II.—*Statement of number of claims for contract and automatic insurance, death and disability, June 30, 1919:*

	Automatic.	Contract.	Total.
Death:			
Claims awarded, fiscal year 1918.....	2,363	4,733	7,096

Mar. 31, 1919.....	1,995,138.29	29,626,822.07	6,678,259.23	20,497,692.35	8,288,740.84
Apr. 30, 1919.....	45,111,689.32	74,738,511.39	9,529,573.92	30,027,266.27	43,870,856.24
May 31, 1919.....	63,507,220.59	138,245,731.98	6,760,024.23	36,787,290.50	100,618,052.60
June 30, 1919.....	57,311,506.59	195,557,238.57	7,011,067.43	43,798,357.93	150,918,491.76

It is, of course, to be understood that war risk insurance is payable only in monthly installments of \$57.50 for each \$10,000 of insurance. There is, therefore, a liability for each award to pay installments in the future which must be borne by these appropriations. Certain transfers from the pay of the Army, Navy, Marine Corps, etc., have still to be made to the credit of this appropriation.

BUREAU OF ENGRAVING AND PRINTING.

The output during the year was the greatest in the history of the Bureau of Engraving and Printing. There were engraved, printed, and delivered 447,464,105 sheets of finished work, of which 66,816,000 sheets of United States notes and certificates were delivered to the Treasurer of the United States; 13,500 sheets of 2 per cent, 3½ per cent, and 4 per cent United States registered bonds, 9,871,438 sheets of Liberty loan bonds, 4,569,740 sheets of gold notes of the United States Victory Liberty loan, 1,620,250 sheets of certificates of indebtedness to the Division of Loans and Currency; 7,090,269 sheets of national-bank currency, 56,809,000 sheets of Federal reserve currency, and 49,999,200 sheets of Federal reserve notes to the Comptroller of the Currency; 76,605,952 sheets of internal-revenue stamps (5,630,150,673 stamps) to the Commissioner of Internal Revenue; 270,250 sheets of customs stamps to the Division of Printing and Stationery; 142,316,519 sheets of United States postage stamps to postmasters on orders of the Postmaster General; 269,536 sheets of Philippine postage stamps to the Bureau of Posts, Manila, P. I., on orders of the Secretary of War; 1,761,500 sheets of Treasury national-bank circulating notes, certificates of indebtedness, and interim certificates for Philippine certificates of indebtedness, internal-revenue and documentary stamps, and postal cards to the government of the Philippine Islands on orders of the Secretary of War; 2,505 sheets of bonds and interim certificates for bonds, and 264,625 sheets of cigarette stamps to the government of Porto Rico on orders of the Secretary of War; 620 sheets of internal-revenue stamps to naval government, Virgin Islands, on order of the Secretary of the Navy; 1,330 sheets of postal savings certificates of deposit to postmasters; 771 sheets of postal savings bonds to Division of Loans and Currency; 387,135 sheets of Federal farm loan bonds and interim certificates for Federal farm loan bonds, and 87,236 sheets of bonds and interim certificates for joint-stock land banks to the Federal Farm Loan Bureau; 15,254,763 sheets of war-savings stamps to Treasurer of the United States, assistant treasurer at New York, Federal reserve banks, and post offices; 882,667 sheets of war-savings certificates to Post Office Department; and 12,569,299 sheets of checks, drafts, and miscellaneous to the Division of Printing and Stationery, of the office of the Secretary of the Treasury; aggregating 447,464,105 sheets. In addition to these impressions delivered, miscellaneous work was executed to the value of \$569,619.32, of which amount \$432,807.40 was reimbursed to the appropriations, \$4,767.44 charged to the appropriations, and \$132,044.48 deposited in the Treasury on account of miscellaneous receipts.

Compared with the deliveries in the fiscal year 1918 there was a decrease of 24.77 per cent in United States notes, certificates, and bonds; an increase of 179.16 per cent in national-bank and Federal reserve currency and Federal reserve notes; 16.11 per cent in United States postage stamps; 46.88 per cent in checks, drafts, and miscellaneous; and a decrease of 29.61 per cent in customs stamps; 14.2 per cent in internal-revenue stamps; 30.72 per cent in war savings stamps; or an average increase for all classes of 12.77 per cent, representing 50,673,820 sheets.

The face value of the sheets delivered aggregated the stupendous sum of \$48,754,644,581.82.

The acts of July 1, 1918, July 3, 1918, and July 11, 1919, contained \$6,098,007.26 for the bureau, and repayments for services and materials furnished the several executive departments and bureaus amounted to \$6,202,754.82, making the total available for the operations of the bureau \$12,300,762.08.

The expenditures for statutory salaries were \$214,849.83, for custody of dies, rolls, and plates \$8,283.33, for compensation of employees \$4,340,236.72, for wages of plate printers and printers' assistants \$2,974,743, for materials and miscellaneous expenses \$3,277,562.60, and for increase of compensation \$755,510.62, making a total of \$11,571,186.10 and leaving an unexpended balance of \$729,575.98, distributed as follows: Statutory salaries, \$31,860.17; custody of dies, rolls, and plates, \$116.67; compensation of employees, \$338,974.75; plate printing, \$113,497.78; and materials and miscellaneous expenses, \$245,126.61.

CUSTOMS.

The aggregate receipts of the Customs Service from all sources for the past fiscal year, according to the reports received from collectors of customs, amounted to \$186,241,435.89, an increase of \$1,390,079.49 as compared with the preceding fiscal year, and over \$112,000,000 less than was collected during the fiscal year ended June 30, 1914, immediately prior to the outbreak of the European War. With the formal restoration of peace, however, it is confidently expected that the customs duties collected under existing laws will gradually increase to their former proportions.

The value of imports for 1919 (exclusive of Porto Rico) amounted to \$3,091,369,329, an increase of \$146,309,926 over those of 1918, while the exports during the fiscal year 1919 amounted to \$7,224,867,829, an increase of \$1,296,582,188 over the exports of 1918, and nearly \$5,000,000,000 greater than the prewar exports reported for the fiscal year 1914.

The total expense of conducting the Customs Service during the past fiscal year was \$10,147,576, which amount represented an increase

of \$138,652 over the total expenses of the preceding fiscal year. It may be stated in this connection, however, that for the fiscal year 1919, \$500,000 was added to the regular customs appropriation to defray the salaries and other expenses incident to the customs enforcement of the "espionage" and "trading with the enemy" acts. By the adoption of frugal methods in the expenditure of this special fund, and repayments made to the appropriation for services performed for other departments, it was possible to return over \$400,000 of this amount to the Treasury unexpended.

Despite the fact that the continuation of the European War decreased the regular activities of the Customs Service, the past fiscal year has been a period of the greatest volume of work in the history of the Customs Service. As the war progressed in its intensity it became necessary to exercise the greatest vigilance to insure the enforcement of the restrictive measures adopted by the Government.

The department may well be proud of the manner in which the loyal and patriotic employees of the Customs Service met the numerous innovations in practice and procedure with which they were confronted during this critical period. For the first time in the history of the service it became necessary during the war to supervise and check with the utmost care the enormous volume of exports; to perform the tedious and vexatious censoring of communications outside of the regular course of the mails; to issue hundreds of thousands of water-front passes, seamen's identification cards, and licenses to vessels; to muster the crews of arriving and departing vessels and cause careful searches to be made of such vessels and their passengers for hidden contraband; to grant bunker licenses with exacting computations for food and fuel allowance; to clear vessels at all hours of the day and night to meet the naval requirements of the convoys; to convert the entire service into an auxiliary to the intelligence service, and to perform various other duties in hitherto untried fields.

Shortly after the signing of the armistice steps were taken to remove the restrictions which had been imposed on commerce as a war emergency, and conferences with that end in view were accordingly held by representatives of the Customs Service with those of other departments for which the Customs Service, during the war, had been to all intents and purposes a "clearing house" in the enforcement of the various war measures. As the result of these conferences, restrictions were gradually removed as far as consistent with the existing conditions, and while it is true that the espionage, trading with the enemy, and passport acts are still in force, the department felt justified, on June 30 last, in discontinuing the special force therefore employed, so that the war work that still remains to be performed, such as the issuance of seamen's passports and identifica-

tion cards, the checking of import and export licenses, and the inspection of passports, is now being performed by the regular force as a part of the customs routine.

The number of foreign vessels entering from and clearing to foreign ports during 1919 were 43,486 and 40,388, respectively, as against 42,682 and 42,277, respectively, during the fiscal year 1918. It may be stated that the increase in marine transactions throughout the country, dating from the signing of the armistice, indicates that with the removal of war restrictions our foreign trade is gradually returning to normal conditions.

Under the act of June 7, 1918, commonly referred to as the motor-boat act, collectors of customs are required to see that all motor boats in their districts are numbered and to impose and collect the penalties prescribed for failure to comply with the provisions of the act, under regulations promulgated by the Secretary of Commerce. These added duties have greatly increased the work in the marine divisions in the various custom houses throughout the country, for not only is it necessary to keep a record of the numbers assigned to every motor boat and the names and addresses of the owners thereof, but subsequent changes of ownerships must likewise be recorded. In some customs districts embracing large areas of water, it has been necessary to increase the office force especially to handle this work.

By reason of the passage of State and Federal prohibition laws, considerable activity has developed at the seaboard and particularly along the Mexican and Canadian frontiers in the smuggling of liquors, which has also appreciably increased the work of custom officers, and special measures had to be devised to meet this new situation. Persons caught smuggling liquors and narcotics into this country have been quickly punished, and as the result of the strict watch maintained and the severe penalties imposed, there is every likelihood that there will be a steady decline in traffic of this character.

During the past fiscal year the custom of holding an annual conference of collectors of customs and appraisers of merchandise, which had been suspended during the war, was resumed. At the recent conference many recommendations were made for improving the customs procedure and are now being considered by the department. The exchange of ideas with respect to customs practices, existing in the various customs districts at these annual conferences, has greatly strengthened the esprit de corps of the service and stimulated a genuine interest in the various administrative officers to improve the efficiency of the work of their respective districts to the highest possible degree.

With a view to reducing the expense of administration and of printing, and to simplify and standardize customs forms and accounting methods, a new accounting procedure was put into operation

throughout the service on April 1, 1919. Under the new method the office records and schedules of collections and disbursements are so arranged that they can be prepared by carbon process at one writing, the naval office records and the schedules for the Auditor for the Treasury Department being copies of the collector's records. Under the new accounting procedure 49 new forms take the place of 194 forms which were required under the former procedure, and the large saving in printing and stationery alone is very easily apparent. While the system has not been in operation long enough to warrant an estimate being given as to actual saving in time and labor that it will accomplish, it is safe to say that at the large naval office ports, the accounting work under the new procedure can be performed with less than half the force required under the old.

Under a recent change in practice, sanctioned by the Comptroller of the Treasury, moneys received under the night unlading act of February 13, 1911, for services of customs officers employed at night and on Sundays and holidays are accounted for as a special deposit, thus permitting of a more timely payment to the employees affected than was possible when such moneys were required to be deposited to the credit of a special fund, and payments made therefrom to the employees in interest.

In the above connection attention is invited to the fact that under the present practice moneys reimbursed for the services of storekeepers and other customs officers, though paid from the customs appropriation, are covered into the Treasury as "Miscellaneous receipts," in accordance with the act of March 4, 1907, which in part provides as follows:

* * * from and after the close of the fiscal year 1907, all sums received from fines, penalties, and forfeitures connected with the customs, and from fees paid into the Treasury by customs officers, and from storage, cartage, drayage, labor, and services, shall be covered into the Treasury as are other miscellaneous receipts.

As the amount of money to be expended in the Customs Service during a given fiscal year is limited to a fixed sum, considerable embarrassment is at times experienced by this department in passing upon applications of merchants for the establishment of bonded warehouses requiring the services of a storekeeper, as well as applications of transportation companies for the stationing of men for inspecting duties at places other than customs ports. While the salaries of these classes of officers are reimbursed to the Government they are actually paid from the fixed customs appropriation, and inasmuch as the demand for the establishment of bonded warehouses fluctuates according to the prevailing business conditions throughout the country there is no certainty of determining even the approximate number of such warehouses which may be established

during the fiscal year. It may very easily happen, therefore, that the officer responsible for keeping the customs expenses within the limit of the appropriation in passing upon the merits of applications for the establishment of bonded warehouses, or for the assignment of customs men to special duties for the accommodation of railroad companies, is influenced in his decision more by the fact as to whether the appropriation can stand the additional expense involved than by the real business necessity which exists for the action requested.

In this connection it may be stated that at the present time the proprietors of warehouses at San Francisco and New York have signified their willingness to increase the salaries of storekeepers in those cities \$200 each per annum, which increase though without expense to the Government, can not be authorized for the reason that there are not sufficient customs funds available for this purpose.

It is accordingly recommended that action be taken to secure an amendment to the act of March 4, 1907, so as to exclude the services of storekeepers and other officers therefrom, and permit the handling of the moneys received on this account in the same manner as reimbursable services rendered under the night unlading act of February 13, 1911; that is, payments made from this source be placed in the collectors' special deposit accounts, and disbursements made direct therefrom by check to the storekeeper, inspector, or other officer performing the service.

Attention is again invited to the efficient and thorough manner in which the men of the Customs Service performed the arduous and intricate duties which devolved upon them during the critical period of the war. They are entitled to special commendation for the patriotic spirit manifested by them in remaining at their posts at salaries far insufficient to meet the prevalent high cost of living, notwithstanding inducements offered them to enter private employ at greatly increased compensations. It is perhaps unnecessary to dwell upon the hardships these men have been subjected to, nor to the actual cases of distress and suffering which have been brought to the attention of the department, but it should be pointed out that some of these men are approaching the limit of endurance and that unless some immediate measure of relief is afforded to meet the growing feeling of discontent, a disintegration of the present efficient organization, which it has taken years of painstaking effort to build up in the Customs Service, seems inevitable.

During the war, men of unusual ability, at great personal sacrifice, remained at their posts from purely patriotic motives, but the termination of hostilities has naturally freed them of this obligation, with the result that the service is being depleted to an alarming extent because these younger and more efficient men are resigning from the

service. At the port of Norfolk alone, the number of resignations from the date of the signing of the armistice to the close of the past fiscal year, a period of eight months, represented approximately 50 per cent of the entire force employed. The difficulty experienced in retaining capable men in the Customs Service is furthermore a hardship to collectors of customs charged with the responsibility of conducting the affairs of their districts along the required standards of efficiency, and it is to be hoped that the conditions referred to will in some manner be remedied.

Tea inspection.

According to the annual report of the supervising tea examiner, the total amount of tea imported and examined, under the Tea Act of March, 1897, during the fiscal year 1919 was 113,338,535 pounds, of which 1,420,568 pounds, or 1.25 per cent, were rejected by the tea examiners as not being equal to the Government standards in quality. Of these rejections 939,187 pounds, or 66 per cent, were appealed to the United States Board of Tea Appeals by the importers, and of the total amount appealed 898,450 pounds, or 95.8 per cent, were finally rejected and 39,737 pounds, or 4.2 per cent, were finally admitted. The 39,737 pounds finally admitted by the United States Board of Tea Appeals brings the total amount that was finally imported for human consumption to 111,957,704 pounds and reduces the amount finally rejected to 1,379,831 pounds, or 1.2 per cent, of the total amount examined.

During the fiscal year there were no rejections for impurities (artificial coloring, facing, etc.). This is the first year since the campaign against artificially colored teas was begun that no teas whatever containing artificial color have sought entrance into the United States. The success of this reform is due to the enthusiastic support given the department by the tea importers of this country as well as the support given by the tea producers and exporters of the Far East. The value of the reform is that it removes the fictitious value that was placed upon some teas by concealing their inferiority and places the tea business on a more equitable basis.

The large percentage of rejections for India, Japan dust, and Java and Sumatra teas was due to the fact that much of these teas just slightly below the Government standards were brought in for human consumption with the hope that they would pass the Government standard and escape the cent-a-pound duty that is placed on teas when imported for manufacturing purposes, because upon being rejected they were reentered for the latter purpose.

The total importations this year are much smaller than last year due to the fact that during the war the importers, fearing restrictions

on tea, brought in much more than in normal times, notwithstanding that the insurance and freight rates were exceedingly high.

In studying the table comparing the importations for the last three fiscal years it is interesting to note that the large importations of teas from the Dutch East Indies made during the war, when they had practically no other market, are continuing after the war, and shows in a pronounced way the effects of the war on this branch of our foreign trade.

According to the report of the Department of Commerce during the fiscal year 1919, more than 15,000,000 pounds of tea have been exported to foreign countries largely to meet the demands of European countries immediately after the war. Most of this tea was taken from the stock imported during 1918.

A deduction of the amount of tea exported from the total amount of tea imported in the last three years shows that, for that period, our average annual consumption amounted to over 116,000,000 pounds.

Recapitulation of statistical tables for fiscal year ended June 30, 1919.

OFFICE OF THE SUPERVISING ARCHITECT.

The following statements show in general the projects authorized by Congress, and in detail the financial operations of the Office of the Supervising Architect for the fiscal year ended June 30, 1919:

BUILDINGS.

New buildings completed (occupied or ready for occupancy) at the close of the fiscal year ended June 30, 1918.....	1,139
Purchase completed (Galveston, Tex., appraiser's stores).....	1
Number of marine hospitals and quarantine stations.....	55
New buildings completed during fiscal year ended June 30, 1919.....	67
Net total number of buildings (completed) under the control of the Treasury Department June 30, 1919.....	1,262
Buildings placed under contract during the fiscal year ended June 30, 1919.....	13
Buildings placed under contract prior to the commencement of the fiscal year 1919 and not completed June 30, 1919.....	14
Contracts for new buildings in force July 1, 1919.....	27
Total number of buildings completed and in course of erection June 30, 1919.....	1,289
Buildings authorized prior to the act of Mar. 4, 1913, not under contract June 30, 1919.....	16
Buildings authorized in acts of Mar. 4 and June 23, 1913; Mar. 4, 1915; July 26, 1916; and Mar. 4, 1917, not under contract June 30, 1919.....	140
Total.....	156
Total buildings completed, in course of erection, or authorized (not including extensions).....	1,445

EXTENSIONS.

Extensions completed (occupied or ready for occupancy) during the fiscal year ended June 30, 1919.....	6
Extensions placed under contract during the fiscal year ended June 30, 1919.....	0
Extensions placed under contract prior to July 1, 1918, and not completed June 30, 1919.....	2
Contracts for extensions in force July 1, 1919.....	2
Extensions authorized prior to act of Mar. 4, 1913, not under contract June 30, 1919.....	1
Extensions authorized in acts of Mar. 4, 1913, and Mar. 4, 1917, not under contract June 30, 1919.....	8
Extensions authorized but not under contract June 30, 1919.....	9

RECAPITULATION.

Contracts completed during the fiscal year ended June 30, 1919:	
New buildings.....	67
Extensions.....	6
Total.....	73
Contracts awarded during the fiscal year ended June 30, 1919:	
New buildings.....	13
Extensions.....	0
Total.....	13
Contracts awarded prior to July 1, 1918, not completed June 30, 1919:	
New buildings.....	14
Extensions.....	2
Total.....	16
Contracts in force July 1, 1919, regardless of date of award:	
New buildings.....	27
Extensions.....	2
Total.....	29

The above statement does not include the following:

Major miscellaneous contracts awarded from July 1, 1918, to June 30, 1919.....	26
Miscellaneous contracts chargeable to the special allotment of \$200,000, under the appropriation "Repairs and preservation of public buildings, 1919"....	24
Minor miscellaneous acceptances, approximately.....	750

STATEMENT OF APPROPRIATIONS MADE DURING THE FISCAL YEAR ENDED JUNE 30, 1919.

Summary of acts carrying appropriations for the fiscal year 1919.

The sundry civil act approved July 1, 1918, carried appropriations as follows:

For buildings only.....	\$1,428,049.00
For extensions, alterations, etc.....	229,800.00
For rent of buildings.....	14,400.00
For marine hospitals.....	17,500.00
For quarantine stations.....	98,000.00
Total.....	\$1,777,749.00

On account of annual appropriations:

For repairs and preservations.....	\$1, 000, 000. 00
For mechanical equipment.....	500, 000. 00
For vaults and safes.....	175, 000. 00
For general expenses.....	525, 000. 00
For operating force.....	3, 500, 000. 00
For furniture and repairs of same.....	650, 000. 00
For operating supplies.....	2, 065, 000. 00
For Salamanca, New York, ground rent.....	7. 50

Total..... \$8, 415, 007. 50

Reappropriated on account of architectural competitions..... 39, 929. 76

Total, this act..... 10, 242, 686. 26

The legislative act approved July 3, 1918, carried an appropriation for "Salaries, Office of Supervising Architect," in amount..... 221, 020. 00

The urgent deficiency act approved July 8, 1918, carried an appropriation for "Operating supplies," in amount..... 150, 000. 00

The urgent deficiency act approved Nov. 4, 1918, carried appropriations as follows:

Repairing post office, courthouse, etc., Chicago, Ill...	\$22, 000. 00
Rent of buildings.....	16, 000. 00
Quarantine stations.....	166, 000. 00

Total, this act..... 204, 000. 00

The urgent deficiency act approved Feb. 25, 1919, carried an appropriation for the completion of remodeling, repair, etc., of the custom-house, New Orleans, La., in amount..... 13, 700. 00

Total amount appropriated for fiscal year 1919..... 10, 831, 406. 26

Summary of acts carrying appropriations for the fiscal year 1920.

The legislative act approved March 1, 1919, carried an appropriation for "Salaries, Office of Supervising Architect," in amount \$221,020. The sundry civil act, not having been approved until after the close of the fiscal year 1919, does not appear in this report. It will appear in the annual report for the fiscal year ending June 30, 1920.

STATEMENT OF APPROPRIATIONS FOR PUBLIC BUILDINGS JULY 1, 1918, TO JUNE 30, 1919.

Expenditures during the fiscal year.

For statutory roll.....	\$212, 478. 14
For sites and additional land.....	\$101, 150. 00
For construction of new buildings.....	7, 057, 014. 43
For extensions to buildings.....	1, 167, 394. 47
For special repairs of buildings.....	165, 859. 09
For rent of buildings.....	33, 496. 31
	8, 524, 914. 30
For repairs and preservation.....	939, 331. 45
For mechanical equipment.....	439, 362. 37
For vaults and safes.....	125, 959. 25
For operating supplies.....	2, 324, 457. 97
For general expenses.....	463, 079. 39
For furniture and repairs of same.....	732, 659. 63
For operating force.....	3, 251, 222. 83
For architectural competitions.....	2, 951. 24
Total.....	17, 065, 416. 57

Contract liabilities existing at close of business June 30, 1919.

On account of statutory roll		
On account of sites and additional land.....	\$103,225.00	
On account of construction of new buildings.....	5,424,788.83	
On account of extensions to buildings.....	706,005.04	
On account of special repairs to buildings.....	32,490.67	
On account of rent of buildings.....	188.17	
Total.....	6,266,697.71	
Less authorized contract liabilities in excess of amounts appropriated under the special appropriations.....	452,503.97	\$5,814,193.74
On account of repairs and preservation.....		336,554.65
On account of mechanical equipment.....		211,649.50
On account of vaults and safes.....		70,483.24
On account of operating supplies.....		357,880.41
On account of general expenses.....		33,454.07
On account of furniture and repairs of same.....		324,798.25
On account of operating force.....		357,837.18
On account of architectural competitions.....		18,762.71
Total.....		7,525,613.75

Unencumbered balances July 1, 1919.

For statutory roll:		
1918.....		\$12,418.20
1919.....		17,102.98
For sites and additional land only.....	\$2,065,952.64	
For construction of new buildings.....	9,537,797.90	
For extensions to buildings.....	2,110,325.01	
For special repairs to buildings.....	473,217.19	
For rent of buildings.....	62,997.50	
		14,250,290.24
For repairs and preservation:		
1918.....		2,609.00
1919.....		3,344.87

PUBLIC HEALTH SERVICE.

The operations of the Public Health Service during the fiscal year 1919 are summarized by the Surgeon General as follows:

Division of Scientific Research.

Upon the signing of the armistice, the division turned its attention to rendering all assistance possible to the program for the continuation and extension of measures for the general protection and improvement of the public health.

Anthrax.—An investigation was made with reference to the occurrence of anthrax, the infection having been found on shaving brushes secured in the open market. As a result the interstate quarantine regulations were amended to control the manufacture of shaving brushes.

Cerebrospinal meningitis.—Investigations of outbreaks of this disease were made at a number of points, and advice was given in regard to the control of the disease.

Malaria.—Malaria investigations during the past year have been limited mostly to work in the extra-cantonment zones, the intensive control operations being supervised by sanitary engineers of the service. Some special problems in malaria control were studied in connection with this work. In addition, surveys were made on request of the State and local health authorities in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, and Oklahoma. Cooperation with the railroads of the South in the supervision of malaria-control work was continued. In so far as possible laboratory and biological studies of special malaria problems were made at the headquarters in New Orleans, and at other points.

Pellagra.—The study of the value of certain single foods as a preventive of pellagra, when added to the diet of a group of inmates in an asylum in which cases of pellagra were ordinarily of frequent occurrence, was continued during the year. Valuable results are expected from this study.

The collection of data with regard to factors influencing pellagra prevalence in cotton-mill villages was practically completed during the fiscal year and reports on the several phases of this comprehensive investigation are now in preparation.

In addition, clinical and laboratory investigations of pellagra have been continued at the service pellagra hospital at Spartanburg, S. C., consisting of dietary treatment of 133 patients and 45 out-patients.

Trachoma.—At the close of the fiscal year five trachoma hospitals were in operation, being located at Pikeville, Jackson, and Greenville, Ky., Tazewell, Tenn., and LaMoure, N. Dak. These hospitals have been operated for the purpose of suppressing trachoma at points where it is most prevalent. In addition, field clinics have been held at various points, and these have proved to be of great advantage, both in giving instructions in the diagnosis and treatment of trachoma, and in educating the public in the prevention of the disease.

Surveys of the prevalence of trachoma have been made in a number of States. The importance of this disease as a public health problem is indicated in the fact that it is gradually spreading to parts of the country which previously had been free from it. In so far as facilities permitted, laboratory and other studies have been made in regard to the disease.

Typhoid fever.—In addition to the rural sanitation work of the service, which has dealt primarily with the prevention of typhoid fever and similar diseases, special studies have been made in regard to the cause of outbreaks of typhoid fever at a number of places.

Rural sanitation.—Studies of and demonstrations in rural sanitation under a special appropriation from Congress were continued during the past fiscal year. The demonstrations have been made in the following counties: Bibb, DeKalb, Glynn, Muskogee, and Walker Counties, Ga.; Calhoun, Madison, Lauderdale, Colbert, and Talladega Counties, Ala.; Cumberland, Edgecombe, Wake, and Durham Counties, N. C.; Charleston County, S. C.; Davidson and Hamilton Counties, Tenn.; Harris, McLennon, Orange, and Tarrant Counties, Tex.; Harrison County, Miss.; Mason County, Ky.; Ottawa County, Okla.; Cherokee County, Kans.; Jasper County, Mo.; and Norfolk and eight other counties in Virginia.

The expenditures of the service for the demonstration phases of the work in each of these counties were met by at least an equal amount of funds furnished from State and local sources. Frequently the counties appropriated much more for the work than was allotted by the service. In most cases these counties comprised wholly or partially rural areas adjacent to cantonments or to large and important war industries. The demonstration consequently not only subserved its normal purpose of improving rural sanitation conditions,

but also operated to furnish immediate sanitary protection to a large number of troops or workers in war industries. One of the primary objects in this rural sanitation work has been to assist in the establishment of a permanent, adequate health organization in the counties in which demonstrations were conducted, such organization to be financed wholly or in great part by the county. This object has been attained in virtually all of the counties in which work was carried out.

Public health organization and administration.—The war necessarily interrupted the studies of public health organization and administration which had previously been conducted by the division in a large number of States and cities. However, the study of county health work in Edgecombe County, N. C., was continued until the end of the fiscal year, and it is believed considerable data of importance in improving rural sanitation has been secured. The service assigned an officer to the city of Boston, to assist in solving problems of public health administration in that city. Following a survey of public health administration in the State of New Mexico, the service detailed an officer to act temporarily as health officer of the State in order to assist in the reorganization of the health department of that State.

Office of Industrial Hygiene and Medicine.—By an executive order of July 1, 1918, the Public Health Service was placed in charge of sanitary or public health activities connected with the prosecution of the war. For the conduct of this work, an office of industrial hygiene and medicine was organized, and district headquarters were established in a number of the large cities of the country. The work of this office was carried out in cooperation with the Working Conditions' Service of the Department of Labor. In addition to making studies and surveys of sanitary conditions in industries such as have been made in previous fiscal years, the division, to a large extent, actually supervised health conditions in plants making munitions and other war supplies, especially those under the control of the Government. Upon the signing of the armistice the service ceased to exercise sanitary supervision of industrial plants, but continued to give advice as to sanitary improvements and medical service, and to conduct special studies in regard to problems of industrial hygiene.

Shipyard sanitation.—Under the presidential order just referred to, the service assumed supervision of activities in connection with the health and sanitation of shipyards under control of the Emergency Fleet Corporation. The corporation gave financial assistance to the work until the middle of February. The service also made sanitary surveys, and took all action possible to improve sanitary conditions in communities in which important shipyards were located. The sanitary control assumed by the service was necessarily discontinued

at the end of the fiscal year, owing to the fact that Congress did not make an appropriation for continuing the work.

Child hygiene.—The experiences of the war, and especially the lessons of the draft, the rehabilitation of devastated areas and the reconstruction problems of the warring nations, all serve to focus the attention of the world upon problems of child hygiene as never before in the history of mankind. Owing to small appropriations the activities of the service in this field have been limited, but the service has made such studies in regard to child hygiene as were practicable. As a part of the general plan of the control of communicable diseases careful health supervision of the schools in these districts was maintained during the past year, wherein 168,357 children were examined for the presence of communicable diseases and incidentally for the detection of hampering physical defects. The work in the schools was supplemented by visits to the homes by nurses, and advantage was taken of the opportunity to instruct parents in matters relating to the health of children. Infant welfare clinics were established in eight zones, and three dental clinics for school children also were operated.

Mental hygiene.—Intensive psychiatric studies were carried on at the State Industrial Farm for Women at Lansing, Kans. A physical and mental study of 100 delinquent women was made in the city of Louisville, Ky. These studies showed that a large percentage of these women were feeble minded, or otherwise abnormal mentally, and that many of them had a limited comprehension of the principles of personal hygiene.

Water supply and sewage disposal.—A number of investigations have been made in order to give advice as to securing proper water supplies and adequate sewage disposal, particularly in places such as cantonments, naval establishments and plants making war materials.

The cooperation of the service with the Capital Issues Committee whereby advice was furnished as to the immediate necessity from a public health standpoint of bond issues and capital expenditures for sanitary improvements was continued until the signing of the armistice. Such advice was given in the case of projects in not less than 45 cities from July 1 until the close of the war, in some cases involving an expenditure of millions of dollars.

Studies of industrial waste were continued, the treatment plant for purifying tannery wastes at Luray, Va., remaining in operation until the end of the fiscal year. It has been demonstrated in these studies that industrial wastes can, in many cases, be purified at comparatively low cost. Reports of these studies are now being published.

Hygienic Laboratory.—The Hygienic Laboratory during the past year studied the question of transmission of influenza from person

to person and conducted other laboratory investigations of the disease. Special studies were made of serums and vaccines for diseases such as anthrax, cerebrospinal meningitis, pneumonia and rabies. Other studies have related to dried milk, methods of detection and prevention of trinitrotoluol and other industrial poisonings, and improving the methods for the manufacture of arsphenamine and nearsphenamine.

Apart from specimens received in connection with the enforcement of the Biologics law, specimens of all kinds have been examined. Nineteen hundred and eighty-eight antirabic treatments and 776,163 c. c. of typhoid vaccine were distributed during the year.

Control of biological products.—Owing to the war, demands for such important preparations as typhoid vaccines, smallpox virus, antimeningococcic and antipneumococcic serums, increased enormously, and their manufacture and sale had to be supervised by the service with more care than ever before. All manufacturers of antimeningococcic and antipneumococcic serums have been requested to submit for examination in the Hygienic Laboratory, samples of every lot manufactured before release to insure the potency and purity of these products. In connection with the licensing of biological products 7,551 samples were examined.

Arsphenamine.—Assistance has been rendered to the Federal Trade Commission in licensing the manufacture and sale of arsphenamine and allied products as in the previous year. The service has continued studies in regard to the toxicity and chemotherapy of this drug, in order to safeguard its use.

Leprosy investigations.—Leprosy studies have been continued in Hawaii at the Leprosy Investigation Station in cooperation with the Quarantine Service, and with the local health authorities. Intensive experimental treatment has been carried out in the case of patients. In the case of all these patients the derivatives of chaulmoogra oil have apparently resulted in improvement, a large percentage having made very favorable progress.

Division of Interstate Quarantine.

Previous to the signing of the armistice, the energies of this division continued to be concentrated on work in extra-cantonment zones and other areas for the protection of the health of the military forces. Since the signing of the armistice this work was continued through the end of the fiscal year only about the permanent camps or those from which soldiers have been demobilized. Consequently the division has gradually been returning to its prewar routine, consisting of the supervision of the purity of water used for drinking and culinary purposes in interstate traffic, plague suppressive meas-

ures, and other activities in connection with the prevention of the interstate spread of diseases.

Interstate water supplies.—During the past year, in addition to the routine supervision of the purity of water used for drinking and culinary purposes in interstate traffic, there also has been conducted a comprehensive study of the general control of such water supplies for the purpose of adequately bringing their regulation up to date and for the utilization in cooperation through as great a degree as possible, of the existing departmental machinery of the various States. This study resulted in the amending of the existing regulations and the subsequent adoption of an improved form of certificate. In localities which are found to be weak in water-supply control, the Federal agency will supplement and otherwise aid the States during the current year. This plan of action received unanimous approval of the conference of State and Territorial health officers.

Plague suppressive measures.—Plague suppressive measures at New Orleans, La., and Seattle, Wash., have been continued, but with a reduced force since plague-infected rats have not been found in either place during the past year. Measures have been continued in and around San Francisco, Calif., with more emphasis being placed upon the ground-squirrel infection. No infected rats have been found in San Francisco since 1908. Infected ground squirrels have been found during the past year and it may be advisable to inaugurate a more intensive plan of hunting during the current fiscal year in order to obtain a more reliable index of their infectivity.

Selection of a suitable site for the national leprosarium.—The board for the selection of a suitable site for the national leprosarium has reached a tentative agreement. It is thought that construction of this institution will be begun before the end of the current fiscal year, and that Federal aid can be extended to those afflicted with leprosy.

Extra-cantonment zone sanitation.—Extra-cantonment zone sanitation has been continued under the joint direction of the Divisions of Domestic Quarantine and Scientific Research, with the assistance of the Bureau of Sanitary Service of the American Red Cross, and in cooperation with State and local health departments. Funds have been supplied by the above agencies and civic organizations for work in and around the individual localities. During the past fiscal year extra-cantonment zone work was conducted in areas about the following camps, training stations, and industrial plants with the most gratifying results:

Camp Beauregard.
Camp Bragg.
Camp Benning.
Camp Bowie.

Barron Field.
Carruthers Field.
Love Field.
Charleston Port Terminal.

Fort Moultrie.	Camp Lee.
Fort Sumter.	Camp Lewis.
Naval Training Station at Charleston, S. C.	Camp McArthur.
Camp Devens.	Rich Field.
Camp Dodge.	Camp McClellan.
Fort Des Moines.	Camp Meade.
Camp Pike.	Camp Merritt.
Eberts Field.	Muscle Shoals Industrial Plant.
Camp Logan.	Payne Field.
Ellington Field.	Park Field.
Park Place.	Camp Polk.
Camp Eustis.	Camp Sevier.
Camp Alexander.	Camp Shelby.
Camp Hill.	Camp Sheridan.
Camp Stuart.	Taylor Field.
Fort Monroe.	Camp Sherman.
Langley Field.	Fort Sill.
Camp Morrison.	Post Field.
Camp Funston.	Souther Field.
Fort Riley.	Camp Zachary Taylor.
Gersner Field.	Camp Knox.
Camp Gordon.	Camp Travis.
Camp Jesup.	Fort Sam Houston.
Fort McPherson.	Brooks Field.
Camp Greene.	Kelley Field No. 1.
Camp Hancock.	Kelley Field No. 2.
Camp Humphreys.	Camp Wadsworth.
Camp Joseph E. Johnston.	Camp Wheeler.
Camp Jackson.	Fort Oglethorpe.
Emerson Field.	Camp Forest.
Fort Leavenworth.	Camp Greenleaf.
	Old Hickory Powder Plant.
Army and naval supply bases at Portsmouth and Norfolk, Va.	
Naval training station at Gulfport, Miss.	
Naval training station at New London, Conn.	
Naval training station at Pensacola, Fla.	
Naval training station at Portsmouth, N. H.	
Munitions and explosive plant at Nitro, W. Va.	
Picric acid plant at Brunswick, Ga.	
Old Hickory Powder Plant at Nashville, Tenn.	

This work, which was instituted under the general authority of the Public Health Service in the zones around the first camps established, was subsequently carried out by the service in accordance with special authority conferred by Congress in Public Act No. 181, Sixty-fifth Congress, H. R. 12441, as follows:

Interstate quarantine service: For cooperation with State and municipal health authorities in the prevention of the spread of contagious and infectious diseases in interstate traffic, including the sanitation of areas adjoining military and naval reservations and Government industrial plants, in order properly to safeguard the health of the military forces and Government employees, \$1,000,000.

The activities may be enumerated as follows: Malaria control, rural sanitation, control of milk supplies, control of food supplies,

medical inspection of schools, public-health nursing, control of communicable diseases, and general sanitation.

To carry out extra-cantonment zone work and the disease-control measures as outlined above, service supervision was maintained in 51 zones, 13 of these having complete organizations, which were given every assistance by service officials on duty. The results of these organizations demonstrated so clearly the advantages to be derived from a completely organized and well-equipped health department that when service activities were concluded, 21 towns and cities in which the service had been operating created and made provision for complete organizations with full-time health officials.

Under the supervision of the Division of Sanitary Reports and Statistics, the service published each week a summary of the prevalence of the more important communicable diseases in the extra-cantonment zones. Officers of the service forwarded over 40,000 completed cards reporting communicable diseases. These cards, when tabulated as to disease, age, sex, color, and termination of illness, should be of value to sanitarians in their study of preventable diseases.

Prevention of interstate spread of disease.—In view of the fact that the Public Health Service is obligated by congressional action to prevent the interstate spread of disease, a plan was discussed at the recent meeting of the State and Territorial health officers in Washington, whereby service officers should be detailed to the different States at the request of the State health officer for the purpose of assisting in the control of the interstate spread of disease. It was decided that assistance could be more efficiently rendered by having a service officer on duty in the individual State health department in order to be able to keep the bureau more closely in touch with the incidence of disease in the respective localities. As a result of this plan an officer has been assigned to this duty in each of the following States where he is available for epidemiological work in order better to assist in the prevention of the interstate spread of disease.

Arkansas.

Georgia.

Louisiana.

Maryland.

Massachusetts.

Indiana.

Ohio.

South Carolina.

Wisconsin.

Mississippi.

The influenza epidemic.—During the summer of 1918 there appeared press reports of an epidemic of so-called "Spanish influenza," which was practically pandemic in southern Europe. The disease was reported to the Public Health Service from France, Switzerland, Great Britain, and elsewhere. Press dispatches reported about 8,000,000 persons suffering from the disease in Spain alone. During April and May, 1918, prior to the report of influenza in epidemic form in the United States, several outbreaks of disease of unknown origin were

reported and were investigated by officers of this service, with the conclusion that it was influenza in a mild form.

The first report to the Surgeon General of any considerable number of known cases in this country was received from Boston, Mass., on September 18, 1918, stating that 2,500 cases existed in that vicinity. On September 24 an officer was detailed to Boston to investigate conditions and obtain whatever information was possible. On September 28 the State health authorities of Massachusetts requested assistance from the bureau in combating what was then an epidemic of serious proportions. An officer of the service was immediately sent to Boston to supervise service activities in cooperation with the different State health departments in the New England States, and within the next few days about 20 service officers had been detailed there.

The disease spread rapidly throughout the country and soon became pandemic. Owing to the inability of States, cities, and localities to furnish medical assistance and nursing supervision to those suffering from the disease, Congress on October 1, 1918, appropriated \$1,000,000 for use in combating the epidemic.

Service officers were detailed to different sections to cooperate with local agencies and to give all possible assistance to afflicted communities. All marine and other hospitals under the direction of the service were opened to patients suffering from the disease. State health officers were made field directors in many instances, as the number of service officers was inadequate. The entire force engaged in extra-cantonment work was employed in the battle with the disease.

The American Medical Association and the Volunteer Medical Service Corps were called upon to furnish medical assistance and the American Red Cross to furnish nurses. This resulted in the employment of about 1,100 doctors and 800 nurses and nursing assistants who were available for duty wherever needed. In addition hundreds of doctors and thousands of nurses and nursing assistants volunteered for service in their own localities. The personnel in the employ of the Public Health Service was shifted about and transferred from State to State as the epidemic lessened in one area and became violent in another.

There was a great dearth of doctors and nurses owing to the demands of the war, and the personnel under the direction of the Public Health rendered splendid service in relieving the distress of many stricken communities. Nurses and physicians also were detailed for duty on various Indian Reservations and in the Territory of Alaska.

The Division of Sanitary Reports and Statistics cooperated in the work. To obtain prompt and adequate information as to the prevalence of the disease throughout the country, all State health officers

were requested to collect reports from municipal and local health authorities, and to send a daily summary to the bureau. These reports were compiled and furnished to those interested in the suppression of the epidemic.

A bulletin of advice was published giving the known facts regarding the disease, its mode of spread, and the precautions which should be observed. Millions of copies of this bulletin were distributed. Press bulletins were sent out through the large newspaper associations, and a series of one-column newspaper articles were supplied in the form of stereotyped plates and matrices to more than 10,000 newspapers. A poster bearing an instructive cartoon calling attention to the necessity for covering coughs and sneezes was displayed in post offices, railroad stations, stores, schools, and on bulletin boards.

The epidemic reached its height during the months of October and November and gradually diminished until in February, 1919, the bureau felt that local physicians were able to meet the demands for medical assistance. Consequently on February 15 virtually all personnel were recalled and all service work discontinued.

Division of Foreign and Insular Quarantine and Immigration.

The operations of the Public Health Service with reference to the administration of quarantine stations and enforcement of quarantine laws and regulations were conducted on the same general lines as formerly. During the year service officers inspected 11,424 vessels and 731,065 passengers and crew at maritime stations. At border quarantine stations 70,171 travelers were inspected, exclusive of the local interurban traffic. There were detained 1,807 vessels, either because of disease on board or because the vessel came from an infected port, and 1,721 vessels were disinfected.

At foreign and insular stations Public Health Service officers inspected 4,245 vessels, 344,326 passengers and crew, and fumigated 1,396 vessels.

During the year the legislature of the State of Texas enacted a law providing for the transfer of certain State quarantine stations, property and functions to the Public Health Service, contingent upon reimbursement to the State of Texas for the property transferred. In accordance with the terms of that measure, negotiations for the transfer were initiated and were progressing at the end of the fiscal year. The chief result of this action will be the elimination of the double quarantine system at Galveston and several points along the Texas-Mexican border and the acquisition of control by the Public Health Service of minor stations along the Gulf at Sabine Pass, Aransas Pass, and Point Isabel. Along the border, quarantine administration will remain as formerly, except that the State will

abandon its function and the Public Health Service will have sole control.

In the latter part of the fiscal year, the governor of the State of Pennsylvania by proclamation suspended the State quarantine service at Delaware River, and plans were perfected whereby the department would take over the Marcus Hook quarantine station under the terms of a lease, at a nominal rental, and conduct quarantine inspection at Delaware River from that place. Inspection of vessels at Reedy Island quarantine station will be discontinued and that station held in reserve for the treatment of infected vessels and the disinfection and detention of passengers and crew as required. By this arrangement there was eliminated a double quarantine system that was most expensive and inconvenient to the commercial interests of Philadelphia.

Baltimore quarantine station continued to be operated by the Public Health Service under the terms of the lease between the Government and the city. The department had hoped that the necessary appropriations would be granted to enable the service to take over both the Baltimore and the New York stations, thus completing the national quarantine system. Favorable action, however, was withheld by Congress.

It has been the established policy of the Government since 1893 to take over local quarantine stations, paying for them at reasonable prices, and operating them under Federal control. Under the general provisions of the act of February 15, 1893, virtually all of the local and State quarantine stations thus have been transferred to the United States Government, the exceptions being Baltimore and New York. The transfer of those two stations is merely being held in abeyance pending the necessary appropriations by Congress.

There were 19 officers of the Public Health Service on duty at American consulates for the purpose of enforcing the provisions of the United States quarantine regulations affecting vessels at the port of departure. These officers also examined intending immigrants for the purpose of determining whether they were eligible physically and mentally for admission to the United States.

The prevalence of plague, yellow fever, cholera, typhus, and small-pox in countries having commercial relations with the United States continued as in the previous year, but the measures carried out by the Public Health Service at foreign and domestic ports have prevented the introduction of any of these maladies.

The operation of the quarantine stations along the Mexican border was so successful that no cases of typhus were reported as occurring in the southwestern part of the United States, notwithstanding a very considerable prevalence of the disease in northern and central Mexico.

An epidemic of typhus of some dimension was reported at Rotterdam, and a public health officer was stationed at that place to carry out precautionary measures against vessels, crews, and passengers destined for the United States. Typhus was also reported as very prevalent in certain of the Italian coast cities, and medical officers of the Public Health Service likewise were assigned to those places to supervise precautionary measures against vessels sailing for the United States. The dissemination of typhus throughout Europe was expected to occur on the cessation of hostilities, and, for the purpose of meeting such an emergency, a medical officer of the Public Health Service was ordered to Europe as general supervisor of service activities in that section. It is a striking testimonial to the sanitary measures carried out among the troops and at embarkation camps that no case of typhus developed on any of the transports returning from Europe or among the crews or passengers of merchant vessels.

Cholera prevailed chiefly in the Orient, where, in the latter part of the fiscal year, it reached grave epidemic proportions, principally in the Philippines and along the Chinese coast. The chief quarantine officer of the Philippines is carrying out all necessary precautionary measures against the spread of the disease to vessels at Manila, thus eliminating danger of the disease being transported to the United States.

Plague prevailed in about the same areas as in the preceding year, but India continues to be the chief reservoir of the infection for the rest of the world.

There was the usual infection reported from Guayaquil, where the disease remains a constant menace to the Canal Zone.

The only measure that seems to promise the successful exclusion of plague from our ports is the systematic fumigation of all vessels for the destruction of rats, and for this purpose 3,117 vessels were fumigated during the year.

Yellow fever again was reported as occurring in epidemic form in Merida, Yucatan Peninsula, Mexico. In the latter part of the fiscal year a severe epidemic was reported in the northern part of Peru, the disease having been introduced from Guayaquil. On the eastern coast of South America a notable epidemic of the disease occurred in the city of Bahia.

While the source of infection at Guayaquil is a constant menace to the Canal Zone, the foci in South America do not constitute any serious menace to the United States. It is the foci in Mexico that constitute the menace to this country.

Smallpox of a very virulent type continued present in Mexico. On account of the aversion of the mass of the population to vaccination, it is not expected that the smallpox situation in Mexico will improve materially for many years to come. For the purpose of preventing

the introduction of infection into the United States chief reliance was placed on vaccination of incoming travelers. In the course of the year 41,376 persons were vaccinated at border points.

Medical inspection of aliens.—During the fiscal year ended June 30, 1919, officers of the Public Health Service examined 926,234 aliens for the purpose of detecting such mental or physical conditions as might render them subject to deportation under the provisions of the immigration law. Of this total 339,375 were passengers, and 586,859 were alien seamen. Of the total number of aliens examined, 19,149 were certified to by Public Health officers as having some mental or physical defect. The disabilities discovered that would render the alien mandatorily subject to deportation were 623 on account of mental defects and 4,530 on account of disease. Nine thousand nine hundred and seventy-one aliens were certified to as having some physical condition that would materially interfere with their ability to earn a living, and 4,025 were certified to as having some minor physical defect.

While the European conditions during the past year were such as materially to curtail immigration, the provisions of the immigration act of February 5, 1917, with reference to the medical examination of alien seamen served to make the magnitude of medical examinations almost on a parity with the prewar period, especially at the port of New York.

Division of Sanitary Reports and Statistics.

Industrial morbidity reports.—To collect industrial morbidity reports, the service has prepared a blank form to be suggested to all industrial establishments which will agree to inaugurate the keeping of records and supply the same to the Public Health Service. These records will be published in the Public Health Reports regularly.

Collaborating epidemiologists, assistant collaborating epidemiologists, and epidemiologic aides.—To assist the States in the collection of more complete morbidity statistics, the service has continued its policy of appointing officials at nominal salaries in additional States and now has 485 collaborating and assistant collaborating epidemiologists. Pursuing this policy of aiding the States and thereby increasing the completeness of the morbidity reports of the service, the bureau has detailed regular officers as epidemiologic aides to eight States. It is intended that these regular officers shall do everything possible to encourage the physicians in their States to report promptly all of the important communicable diseases. If these details of epidemiologic aids prove satisfactory and add to the efficiency of morbidity reporting, it is contemplated detailing regular officers to every State desiring such cooperation.

State and city morbidity reports.—Weekly telegraphic reports of the prevalence of communicable diseases were received from State health officers and published currently in the Public Health Reports, 24 States reporting at the close of the year.

Thirty-nine States furnished monthly reports of the prevalence of preventable diseases, and annual summaries of the reported morbidity or mortality, or both, were received from 44 States.

At the end of the year, reports of the prevalence of communicable diseases from 475 cities in all parts of the United States were being received and published weekly in the Public Health Reports, an increase of 25 cities as compared with the previous fiscal year.

Public Health Reports.—During the fiscal year the weekly Public Health Reports contained 2,737 pages, or 464 more than during the preceding year. Sixty-four articles appearing in this publication were reprinted as separate pamphlets for economical distribution.

Division of Marine Hospitals and Relief.

During the fiscal year 93,722 patients received treatment as beneficiaries of the service. Of this number 38,355 were treated in hospitals, and 55,367 were treated as dispensary or out-patients. The hospital patients received a total of 757,018 days' treatment. Of the above patients 13,856 were beneficiaries of the Bureau of War Risk Insurance, and 6,465 were injured employees of the Government coming under the United States Employees' Compensation Commission, 11,454 being treated in hospital and 8,867 treated as dispensary or out-patients. During the year the service operated 21 marine hospitals, all of which are owned by the Government, and maintained 118 other relief stations where medical assistance was furnished patients.

In carrying out the provisions of the act of Congress approved March 3, 1919, entitled "An act to authorize the Secretary of the Treasury to provide hospital and sanatorium facilities for discharged sick and disabled soldiers, sailors, and marines," nine Public Health hospitals were established during the latter part of the year, chiefly in May and June. The majority of these hospitals were transferred to this service by the War Department under the provisions of the above-mentioned act.

At the tuberculosis sanatorium of the service at Fort Stanton, N. Mex., 600 patients were cared for during the year. Of these, 319 were discharged, 81 died at the sanatorium, and 200 remained under treatment at the close of the year.

Aid was extended to other branches of the Government in the physical examinations of 41,185 persons, of whom 3,593 were rejected. In addition, 10,306 merchant seamen were physically

examined to determine their fitness for service on American vessels, of whom 908 were rejected; and 1,749 foreign seamen were examined, of whom 80 were rejected. Nine thousand six hundred and sixteen beneficiaries of the War Risk Insurance Act were given physical examinations.

During the latter part of the year the Canadian Government requested the Secretary of the Treasury to extend to discharged Canadian soldiers resident in the United States the facilities of the hospitals of the Public Health Service under a reciprocal arrangement by which discharged American soldiers would receive the same privileges in Canada. In pursuance of this request plans were made whereby the Public Health Service will treat in its hospitals and contract hospitals all discharged Canadian soldiers resident in the United States, and Canada will do likewise with respect to discharged American soldiers.

Division of Venereal Diseases.

With the signing of the Army appropriation bill on July 9, 1918, the Division of Venereal Diseases was created as a part of the Public Health Service with an assistant surgeon general in charge. The act appropriated \$1,000,000 for allotment to States which should adopt the regulations for the control of venereal diseases promulgated by the Secretary of the Treasury.

The duties of the division under the law are to study and investigate the cause, treatment, and method of prevention of such diseases to cooperate with State boards of health; and to promulgate and enforce interstate quarantine regulations governing the travel of infected persons.

The program for carrying out the law has developed into three phases: The medical, the educational, and the law enforcement. The proper coordination of these three phases is deemed essential to the success of the program as a whole, but it has proved a problem most difficult of solution. It is believed, however, that progress has been made and that the results obtained indicate that a solution is being found.

Public-health education.

The importance of the educational activities of the Public Health Service was never better exemplified than during the nation-wide epidemic of influenza.

In order to extend and better coordinate this important educational work, a section of public health education was organized in April, 1919. In the short period the section has been in operation a number of promising features have been inaugurated, and there is reason to believe that the organization of this section will contribute greatly to the promoting of the public health.

The section aims to constitute itself a national center or clearing house on the subject of public health education. Plans are under way whereby all the ordinary media of publicity and education will be used. This will involve the preparation of press bulletins and the utilization of stereomats and plates, the publication of lithographed health posters, the organization of a lecture service, the administration of a loan library of stereopticon slides and moving pictures, the preparation and organization of traveling exhibits, the maintenance of a public health information bureau, and the employment of such other educational methods as the circumstances may indicate. It is planned to carry on these activities in close cooperation with State and local health authorities and with important national health organizations.

During the fiscal year 1919, the service issued more publications than in any other year since its creation. Exclusive of the publications of the Division of Venereal Diseases, the editions aggregated 9,532,392 copies, an increase of 5,167,542 over that reported last year. The publications of the Division of Venereal Diseases aggregated 10,120,772 copies. In the face of the country's large demand for the bureau's publications, the limited funds available for printing made it necessary to curtail the issue of a considerable number of health leaflets and entirely to forego reprinting some of the leaflets in foreign languages for use in industrial centers having a large foreign element.

Recommendations.

Personnel.—At the close of the fiscal year ended June 30, 1918 there were 218 medical officers in the regular commissioned corps. This number has decreased to 206, by deaths and resignations, in spite of strenuous and persistent efforts to augment the service by recruits in the entrance grade and notwithstanding the fact that Congress authorized by the act approved March 3, 1919, a large addition to the corps to enable it to care for the patients of the War Risk Insurance Bureau. Moreover, at this time the number is still further being reduced by additional resignations, and it is clear that something must be done to obtain and retain efficient medical officers for duty in the Public Health Service.

At present, the opportunities in private life are so much greater in the way of financial returns that it is practically impossible to obtain recruits in the grade of assistant surgeon, which is the only way provided in law.

The failure to increase is partly due to the fact that the pay in the lower grades is not commensurate with that received in private life and partly due to the fact that the prospect for promotion to the higher grades is uncertain.

In order to remove these handicaps to recruiting the service to the required number, the following legislation is respectfully recommended:

1. Provision for a substantial increase in the compensation for the commissioned corps.
2. Provision for the promotion of assistant surgeons to the grade of passed assistant surgeon, after three years' service, instead of four as at present.
3. Provision for an increase in the number of senior surgeons and assistant surgeons general.
4. In addition to the needs of improving the conditions of the regular commissioned medical corps, the development of the Public Health Service now requires the commissioning of men who represent branches of the sanitary profession other than medical. This matter is becoming more urgent as time goes on, and the passage of legislation is needed to permit commissioning in the Public Health Service, members of the sanitary profession, such as sanitary engineers, pharmacologists, zoologists, chemists and bacteriologists, after satisfactory examination.

National quarantine.—The recommendation of former years is renewed with respect to the acquisition of the New York and Baltimore quarantine stations, thus completing the national quarantine system.

The respective governments of the State of New York and the City of Baltimore have enacted the necessary legislation authorizing the transfer of these two properties to the United States Government subject to reimbursement being made in accordance with the valuation of the property being transferred. The Secretary of the Treasury is authorized to take over local quarantines in the act of February 15, 1893, and the lack of funds alone prevents the consummation of the transfer of these two stations to the Government. Recommendations repeatedly have been submitted to Congress for the necessary appropriations, but favorable action thus far has been withheld. The deferred action, however, appears to have been based more on questions of economy than policy, and the department trusts that there will be no reversal of the policy for national control of quarantine as expressed in the act of February 15, 1893, in accordance with which a very large number of local quarantines have been acquired by the United States Government and paid for according to the value of the property transferred.

Reports of prevalence of diseases.—It is again recommended that appropriations be increased in order that the present system may be extended and the reports made more complete. No health agency can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring. The

\$25,000 now appropriated for this purpose should be increased to \$100,000 for the next fiscal year. With adequate appropriations it will be possible to establish a registration area for morbidity reports and in time extend the area to cover most of the population of the United States.

Provision should be made for the issuance of a weekly mimeographed bulletin for immediate distribution to health officers giving information of the prevalence of communicable diseases in cities in different parts of the United States. The data for such a bulletin can be secured by telegraph from city health officers.

Division of Venereal Diseases.—The work of the Division of Venereal Diseases is of such great importance as a public health problem, and the details of a coordinated plan for the entire country are so varied, that increased personnel for this division is desired. At least \$320,000 is required for the proper operation of this division for the ensuing fiscal year.

COAST GUARD.

Award of life-saving medals.

Forty-one medals were awarded by the Secretary of the Treasury during the fiscal year ended June 30, 1919, under authority of acts of Congress approved June 20, 1874, June 18, 1878, May 4, 1882, and January 28, 1915, in recognition of heroism displayed upon thirty-four occasions in the rescue, or attempted rescue, of persons in danger of drowning in United States waters and from American vessels at sea. The medal of the first class (gold) was bestowed in five instances, and the medal of the second class (silver) in thirty-six instances. Twenty-four of the medalists were attached to the United States Navy; eight to the United States Army; two to the United States Marine Corps; two to the United States Coast Guard; three were police officers and two were civilians. Of those belonging to the Navy, five were officers and nineteen enlisted men. Of those belonging to the Army, two were officers and six enlisted men. The work of the medalists in twenty-three instances was performed within the boundaries of the United States; in five, at sea; in two, in France; in two, in the Dominican Republic; and in one, in Scotland. The number of persons rescued was thirty-seven; of whom twenty-eight were men, two women, and seven children.

LOANS AND CURRENCY.

The following is the report of the Division of Loans and Currency for the fiscal year ended June 30, 1919:

Interest-bearing debt of the United States—Changes during the fiscal year ended June 30, 1919.

DIVISION OF PUBLIC MONEYS.

The monetary operations of the Government have been conducted through the Treasurer of the United States, 9 Assistant Treasurers of the United States, 12 Federal reserve banks, 18 branch Federal reserve banks, the treasurer of the Philippine Islands, the American Colonial Bank of Porto Rico, and 1,331 national-bank depositaries.

To prevent disturbing the financial conditions on account of payments made in connection with subscriptions to Liberty bonds, Victory notes, and for the purchase of Treasury certificates of indebtedness, the Secretary continued the policy of specially designating incorporated banks and trust companies as depositaries of public moneys, thus permitting the subscribing banks to deposit by credit with themselves, until needed by the Government, the proceeds arising from the above-mentioned sources. Such deposits paid 2 per cent to the Treasury.

On July 1, 1918, there were 6,510 special depositaries which, with 3,040 designated during the past year, made the total number 9,550 on June 30, 1919. Of these 4,511 were national banks and 5,039 State banks and trust companies. Sixty-five of the original 88 banks designated in the drought-stricken districts of Texas and New Mexico, under the Secretary's announcement of March 21, 1918, were continued through a portion of the year 1919 for the purpose of aiding the stock-raising industry. These deposits were repaid into the Treasury during the year.

During the fiscal year of 1918, 11 depositaries were established in foreign countries for the purpose of enabling Government disbursing officers to make prompt payments in connection with the purchase of supplies and for payment of officers, enlisted men of the Army and Navy, and for other purposes. Eleven additional depositaries were

established for the same purpose during the year, so that on June 30, 1919, there were five depositaries in England, five in France, two in Belgium, three in Italy, two in Spain, one in Switzerland, two in Canada, and two in Argentina.

The amount of public moneys held by depositaries on June 30, 1919, was as follows:

Deposits in Federal land banks.....	\$500,000. 00
Deposits in Federal reserve banks.....	105,457,355. 50
Deposits in special depositaries, account of sales of certificates of indebtedness and Victory notes.....	905,397,000. 00
Deposits in foreign depositaries:	
To credit of Treasurer of the United States.....	24,641,009. 19
Deposits in national banks:	
To credit of Treasurer of the United States.....	45,492,512. 64
To credit of other Government officers.....	9,081,833. 82
Deposits in Philippine Treasury:	
To credit of Treasurer of the United States.....	6,299,935. 95
To credit of other Government officers.....	2,075,807. 01
Total of all funds with depositaries on June 30, 1919.....	1,098,945,454. 11

On June 30, 1919, there were 765 regular national bank depositaries, 12 Federal reserve banks, 18 branch Federal reserve banks, 566 temporary national bank depositaries, and 9,550 special depositaries for Liberty loan and Treasury certificates of indebtedness funds. Eight regular depositaries were designated for the convenience of Government disbursing officers in connection with Army cantonments, camps, and aviation fields during the year, and 25 regular and 24 temporary depositaries were discontinued; 3,193 special depositaries were designated and 153 discontinued.

Under the provisions of the act of October 6, 1917, and the proclamation issued thereunder by the President under date of October 12, 1917, the Secretary of the Treasury purchased from funds deposited by the Alien Property Custodian United States securities of the par value of \$109,612,500. There were on hand July 1, 1918, similar securities of the par value of \$39,122,000. Securities of the value of \$47,336,000 matured and were redeemed, the proceeds being reinvested as available. The total amount of such securities carried by the Secretary of the Treasury in the vaults of the Treasurer of the United States in trust for the Alien Property Custodian on June 30, 1919, was \$101,398,500.

One Federal land bank was designated as a depositary of public moneys during the year in accordance with the provisions of the act of July 17, 1916, and a deposit of \$500,000 was made therewith, which deposit has since been repaid to the Government.

As authorized by the act of January 18, 1918, amending act of July 17, 1916, the Secretary of the Treasury purchased during the fiscal year 1919 \$85,615,000 farm loan bonds. The department was carrying on June 30, 1918, \$56,970,000 of such bonds, and the

various Federal land banks repurchased bonds during the fiscal year 1919 to the amount of \$5,700,000, leaving the total amount of farm loan bonds on hand at the close of the year \$136,885,000.

On November 1, 1919, the total number of depositaries not including those carrying special deposits on account of subscriptions for Liberty bonds, Victory notes, and purchases of Treasury certificates was 1,295 and the amount held by them was \$45,140,659.63.

SECRET SERVICE DIVISION.

There were 510 arrests made by Secret Service agents or under their direction during the year. Nearly half of this number were for violations of sections 148 and 151 of the Federal Penal Code. Note raisers and check forgers were mainly responsible for this unprecedented record. Nine new counterfeit note issues were discovered in circulation, only two of which, however, were in any sense dangerous. Counterfeit notes amounting to \$22,839.10 were seized or captured. Sixteen thousand one hundred eighty-seven dollars and forty-eight cents in counterfeit coins were taken out of circulation or captured from the makers. One hundred and fifty-seven plates, 15 dies, and 109½ molds for note and coin counterfeiting, together with miscellaneous contraband property, such as presses, cutting machines, crucibles, ladles, etc., were seized.

The nine new counterfeit note issues discovered were as follows:

February 1, 1919, \$20 Federal reserve note, Bank of New York. Poor photo-lithograph.

February 24, 1919, \$10 Federal reserve note, Bank of New York. Poor photo-lithograph.

April 30, 1919, \$5 Federal reserve note, Bank of Chicago. Poor lithograph.

April 30, 1919, \$20 Federal reserve note, Bank of San Francisco. Photograph; not deceptive.

May 6, 1919, \$1 silver certificate. Photo-mechanical. Poor.

May 6, 1919, \$10 Federal reserve note, Bank of New York. Very poor lithograph.

May 20, 1919, \$1 Federal reserve bank note, Bank of Cleveland. Zinc-etched. Poor.

May 23, 1919, \$5 Federal reserve note, Bank of Chicago. Etched; deceptive.

June 14, 1919, \$20 Federal reserve note, Bank of Boston. Etched; deceptive.

In addition to their work in the suppression of counterfeiting, agents of the service investigated many cases of thefts of Government property, violations of the gold exporting, customs, and other laws relating to the Treasury Department and its several branches, as well as rendering valuable service in cooperation with the Food Administration and War Trade Intelligence Bureau.

REPORT OF THE SECRETARY OF WAR.

WAR DEPARTMENT,
Washington, November 11, 1919.

MR. PRESIDENT:

The reports herewith transmitted cover the operations of the War Department for the year 1919. A comprehensive report is in process of preparation by Gen. Pershing which, when completed, will cover in detail all the operations of the American Expeditionary Forces in France. I shall transmit that report to you upon its completion, and its publication as a separate document will no doubt be authorized. The general operations of the department are covered in the reports of the Chief of Staff and the heads of the operating divisions of the War Department in America. For the most part, they cover the fiscal year ending July 1, 1919, and must be read in conjunction with similar reports submitted in 1918 and 1917 to complete the story of the activities of the War Department from the declaration of war on the 6th of April, 1917, to the present time.

The armistice, which concluded hostilities on the 11th of November, 1918, called upon us to reverse the flow of men and supplies across the Atlantic. Up to that day the energies of the department were devoted to the acceleration of the processes by which our Army was selected, trained, transported to France, and supplied there. From the 11th of November our problems have been the return and demobilization of our soldiers, cancellation and adjustment of contracts for war supplies, the settlement of obligations between the War Department and the public authorities and nationals of our Allies in the war, and the formulation of a military policy for the country which would adjust the permanent Military Establishment to our needs and apply to its organization the lessons learned in the war. These diverse matters must be separately discussed.

Our battle field was in France. The problem was to select, train, equip, and transport soldiers in the largest number possible and to bring their weight to bear as early and as decisively as possible in order to shorten the war and assure victory. The United States entered the World War on the 6th of April, 1917; the armistice went into effect on the 11th of November, 1918—a period of one year, seven months and five days. During that time the size of the Army was increased from about 200,000 men, of whom 133,000 were in the Regular Army and 67,000 in the National Guard, to an aggregate of

3,757,624 men, of whom 2,086,000 were transported to France. At the end of 1917 our forces in France aggregated 194,000 men; during the succeeding months the number of men transported was as follows:

January.....	47, 853	June.....	278, 664
February.....	49, 110	July.....	306, 350
March.....	84, 889	August.....	285, 974
April.....	118, 642	September.....	257, 457
May.....	245, 945	October.....	180, 326

In the last six months of the war, therefore, substantially a million and a half men were transported to France, and in the great battle of the Meuse-Argonne, which lasted in all 47 days and came to an end with the signing of the armistice, 1,200,000 American soldiers participated, divided into 29 combat divisions and bringing to bear a fighting strength which drove the enemy out of defensive works, constructed through years of occupation, in which every scientific resource was exhausted to make them impregnable.

In attempting to measure the extent and success of the American military effort, certain limiting factors must be kept in mind. The most important and controlling of these was the capacity of troop and cargo transport available from time to time. Submarine warfare made heavy inroads upon the available ocean-going tonnage of the world. The estimated aggregate tonnage sunk is 9,236,483 tons, out of 25,140,000 tons under allied flags at the beginning of the war. It was early realized that ocean tonnage would play a controlling part both in the possibility of American participation on the European front and in the maintenance of food and other supplies for the European nations engaged. As a consequence, a great shipbuilding program was formulated in the United States, and from it rapidly increasing relief was experienced; but in March, 1918, when the spring offensive on the western front opened and the need for the immediate transportation of large numbers of American soldiers became apparent, the question of ships remained critical, and the response which America made to the demands of the situation was necessarily adapted to the tonnage available. Under your direction, preference was given to the shipment of infantry and machine-gun units, and it was only after the immediate menace of the German drive had been relieved that troops of other arms could be sent and our troops organized into complete divisions in France. As it was, of the total number of American troops transported to France, 49 per cent were carried in British ships.

The tonnage limitation, however, was even more severely felt in the matter of cargo. As the American Expeditionary Forces in France grew in numbers their needs correspondingly increased, and as American production of war materials got into its full swing vast

masses of material accumulated here awaiting transport. The situation, however, was such as to require the most intensive economy in cargo space and frequent changes in programs of shipments. The commanding general in France made out a schedule of priorities covering all supplies needed by him, and the supply departments in the United States used the tonnage available to supply first the needs indicated in the priority program. To save time and to save tonnage, supplies were purchased for the American Army in Europe whenever possible, and whenever an adequate supply of any needed article could be found in Europe its place on the priority shipping program was given to the next need for which American resources had to be relied upon. We had, therefore, constantly to balance our ability to transport troops against our ability to supply them and maintain them in the field.

Another limiting factor was the production or procurement of artillery. The facilities for the production of cannon in the United States prior to the war were very limited. In England and France great plants had grown up, feeding an increasing supply of these arms to their forces, and a very helpful arrangement was made with the French Government to supply divisional artillery to American troops which would have been quite adequate to the program originally adopted for the building up of the American Army. The department, however, set about the creation of additional facilities in this country, realizing the necessity of having an American source of supply. The report of the Chief of Ordnance shows the progress we had made when the armistice came, and had the war continued into another year American-made artillery would have completely solved the problem which the equipment of our rapidly increasing forces presented.

These facts are adverted to both to show the hearty cooperation of our British and French associates in the transportation and equipment of our forces, and also the success with which the United States addressed itself to the problem of creating independent sources of supply in ships and artillery, both of which require time and extensive industrial coordination for their production.

A third set of limitations arose out of the demands made upon American industry and raw material supplies by our Allies. The practical paralysis of production in the European countries during the war caused the Allies to rely more and more upon outside sources of supply. Prior to our own entry into the war the several European countries maintained elaborate purchasing agencies here, and drew heavily upon us for raw materials and finished products of every kind. When the United States came rapidly to increase its own Army, American industry was already intensively engaged in pro-

ducing the necessities of life for our own people and great quantities of subsistence and other materials upon which our Allies depended both for the needs of their civil populations and for their armies. It was not possible arbitrarily to cut off our associates in order that our own Army might be speedily equipped and supplied. We had constantly to bear in mind the needs of the Allies who were actually holding the fighting front, and of the civil populations back of their armies, upon whose morale the continuance of the conflict depended until our own forces could arrive in such numbers as to give decisive weight to the allied military power.

The allied purchasing agencies were, therefore, pooled and their requirements coordinated through an allied purchasing agency, which finally became associated with the War Industries Board, and there, daily, it was necessary to decide allocations of raw material and manufacturing facilities in order to distribute among these many urgent needs the available materials, as far as possible, in the order of their relative urgency.

The generous assistance rendered to the United States by Great Britain and France in the matters above referred to, and in many other ways, was reciprocated by action in this country which made common cause with our Allies in providing access to the material resources of the United States. One result of this was that on both sides of the ocean there was cooperation and mutual assistance, and much costly duplication of facilities was eliminated.

Another result, however, was the necessity constantly to deal with the limitations upon our ability to equip our own armies which this preference for the common cause entailed. There were shortages in equipment of the American Army which the stimulated and aggressive industry of America could easily have supplied but which were voluntarily endured in order not to cause a more distressing shortage in some important need of the nations associated with us.

Considerations of this kind abounded on every hand, as was to be expected, in an enterprise which represented the concentration of the financial, industrial, and commercial power of four great nations, and no judgment of the part played by any one of these nations is just which counts only the numbers of its soldiers or any other item of its activities which can be exhibited statistically and fails to note the extent to which cooperation required it to subordinate its own operations in the interest of the success of the combined effort. The spirit of this cooperation was splendid throughout. Nothing but a great cause understood and loved alike by the people of the several allied nations could have sustained it.

The simple beginning of the American Expeditionary Forces is found in the orders issued to Gen. Pershing on the 26th day of May, 1917. They are as follows:

From: The Secretary of War.

To: Maj. Gen. J. J. Pershing, United States Army.

Subject: Command, authority, and duties in Europe.

The President directs me to communicate to you the following:

1. The President designates you to command all the land forces of the United States operating in continental Europe and in the United Kingdom of Great Britain and Ireland, including any part of the Marine Corps which may be detached for service there with the Army. From your command are excepted the military attachés and others of the Army who may be on duty directly with our several embassies.

2. You will proceed with your staff to Europe. Upon arrival in Great Britain, France, or any other of the countries at war with the Imperial German Government, you will at once place yourself in communication with the American Embassy and through its agency with the authorities of any country to which forces of the United States may be sent.

3. You are invested with the authority and duties devolved by the laws, regulations, orders, and customs of the United States upon the commander of an army in the field in time of war and with the authority and duties in like manner devolved upon department commanders in peace and war, including the special authorities and duties assigned to the commander of the Philippine Department in so far as the same are applicable to the particular circumstances of your command.

4. You will establish, after consultation with the French War Office, all necessary bases, lines of communication, depots, etc., and make all the incidental arrangements essential to active participation at the front.

5. In military operations against the Imperial German Government you are directed to cooperate with the forces of the other countries employed against that enemy; but in so doing the underlying idea must be kept in view that the forces of the United States are a separate and distinct component of the combined forces, the identity of which must be preserved. This fundamental rule is subject to such minor exceptions in particular circumstances as your judgment may approve. The decision as to when your command, or any of its parts, is ready for action is confided to you, and you will exercise full discretion in determining the manner of cooperation. But, until the forces of the United States are in your judgment sufficiently strong to warrant operations as an independent command, it is understood that you will cooperate as a component of whatever army you may be assigned to by the French Government.

6. You will keep the department fully advised of all that concerns your command, and will communicate your recommendations freely and directly to the department. And, in general, you are vested with all necessary authority to carry on the war vigorously in harmony with the spirit of these instructions and toward a victorious conclusion.

These orders, it is to be observed, directed Gen. Pershing to proceed with his staff to Europe and gave him wide authority and discretion. They particularly directed him to establish all necessary bases, lines of communication, depots, etc., and to make all the incidental arrangements essential to active participation at the front, and they pointed out to him that in military operations against the Imperial German Government "the underlying idea must be kept in view that the forces of the United States are a separate and distinct component of the combined forces, the identity of which must be preserved." They intrusted to Gen. Pershing's discretion and judgment also the manner of cooperation between his command and the allied armies, so that from the first he was free to use his forces

as the exigencies of the situation might from time to time suggest, but always he was to keep in mind that the intention of this Government was that its military forces should be independent and that, when they had arrived at an adequate strength, they should conduct operations under independent command.

The communication between Gen. Pershing and the War Department was, of course, constant and voluminous. It dealt, however, with details of men and supplies. The authority conferred upon him by his original orders was never in any particular modified or diminished, and the fundamental view expressed in his initial orders as to the character of American participation was steadily adhered to under your direction to the end. Gen. Pershing left America with your full confidence and that of the War Department. Throughout the strenuous and sometimes terrible months of our participation this confidence supported and sustained him, and when he returned to America it was to close a great military undertaking, during which no shadow of misunderstanding had arisen between him and his Commander in Chief. The theory of these orders, of course, was that our field of operations was necessarily removed a great distance from Washington, that it was quite impossible for us to form accurate judgments of the varying incidents in the field of operations, and that imposing the tremendous responsibility for the success of the expedition upon its commander we could not do less than give him full authority and leave him untrammelled by attempts to formulate plans of action which, made at a great distance, could not be informed with knowledge of the situation which the commander at the front had when the plans reached him.

But if there was this confidence and full donation of authority upon the one side, there was a splendid response from the commander on the other side. Gen. Pershing and his staff proceeded to Europe, placed themselves in communication with the military authorities of Great Britain and France, studied earnestly the military operations on the western front up to the time of their arrival, measured the strength of the enemy and the resources of our allies.

There were elements in the problem which might well have caused grave apprehension. The armies of France, Great Britain, and Italy had borne for three years the furious and deadly assaults of the great German military machine, the toll levied by battle upon the manpower of these nations had been appalling, and it was becoming increasingly difficult for them to maintain their divisions at full strength. The submarine peril menaced the supply of munitions of war and of foodstuffs to great civil populations, which were called upon in increasing numbers to abandon production in order that they might give themselves as soldiers in the ranks or as workers in the munitions plants. Rigid economies were being enforced on every hand to make the scanty importations of food cover the wants of peoples

wasted by war. Meanwhile the German armies had crushed long-planned offensives by the allied armies with apparent ease, and by the collapse of Russia were daily being strengthened by divisions of trained soldiers brought from the eastern front until the menace of superior numbers and apparently inexhaustible supplies of the munitions of war haunted the councils of the allied powers.

But those who visited Gen. Pershing's headquarters during the war know that from the beginning there was resolution and a clear-sighted knowledge of the size of the task. It would have been idle to plan for a small American Army. On the other hand, it required imagination and daring to plan for a large one—to take a million American men to France, separate them from home by 3,000 miles of ocean, and subject them to the hazard of the uncertain and diminishing food supplies of Europe. To face the possibility of having such an army cut off from its home base without adequate munitions or subsistence was bad enough; but there still remained the question as to whether such an army could in fact be transported. History furnished no example, and the diminishing tonnage under allied control offered little encouragement; and there still remained the further question: If these difficulties could be overcome, could they be overcome in time?

Gen. Pershing and his associates gave no room to doubt and accepted no counsel except that of determination. They began at the seashore of France, deepening rivers and building great docks and warehouses, enlarging railroads, establishing supply bases and facilities, all on such a scale that when the critical hour came and the combined energies of the United States and Great Britain did surpass all previous estimates and land 2,000,000 men in France, the arrangements made for their reception and for their maintenance were found adequate; and had the war gone on and the 80-division program been carried out, the imagination and daring of these early plans would still have been adequate.

The detailed description of the things done in France must necessarily be left to the full report which Gen. Pershing is preparing. It is a wonderful story and exhibits at its best the confidence in their institutions which Americans may justly have. It exhibits also the talent of America flocking about the national standard in the hour of need, spending itself without reserve to do a great thing. There grew up in France a vast system of engineering and other undertakings in an incredibly short space of time, and they were a monument alike to the commanding general, to the great company who aided him there and here, and to the devotion of the American spirit, both abroad and at home, which gave itself intensely that the cherished blessings of civilization should not perish.

It is difficult in this report to refrain from commenting upon the thoroughness with which the purely military preparation in France

was made. A substantially new organization of tactical units was created, schools were established in order that the latest practice in the various arms and in staff work might be accurately taught, officers were trained in association with our veteran allies, and in turn trained their associates.

Throughout all of this, as in the earlier uses of our forces, there ran the thread of the original order which led to the ultimate organization and use of an independent American Army. It is not ungenerous to recall that the allied higher command hesitated to believe that it would be possible for the American Army, entering the contest so late, to acquire what they themselves had got by cruel experience from the beginning. Suggestions were constantly made that it would be wiser to fill in gaps with American troops and associate them in small units with the veteran French and British armies. Indeed, it became necessary after the German drive beginning in March, 1918, to depart temporarily from the settled plan, and Gen. Pershing in the presence of the emergency promptly placed his entire force at the disposition of the supreme commander and yielded to the request for the preferential shipment of infantrymen and machine-gun units and their speedy association with larger organizations of British and French troops, but in September, 1918, it was at last possible to undertake a great American offensive operation.

Some of our divisions remained associated with the British and French armies, and between March and September defensive and offensive operations were participated in by American troops; but from the time the battle of the St. Mihiel salient began the distinctive, independent American Army, occupying its own sector of the front, pressed relentlessly its attack, and in the combined operations which brought the war to a victorious conclusion the American Army bore its full share of the burdens of battle and contributed its full share to the allied success.

When the armistice came the American force in France exceeded that of Great Britain and was fast approaching that of France. The ration strength of the three forces showed the Americans 31 per cent, the British 28 per cent, and the French 41 per cent; of the length of the western front the American Army held 22 per cent, the British 19 per cent, and the French 59 per cent. Had the rate at which American troops were being transported continued a few months longer, the American Army would have exceeded in strength the French Army.

During the summer of 1918 Gen. Pershing recommended by cable that the American program contemplate 80 combat divisions in France for the campaign of 1919. Later studies led him to recommend an increase in this program to a strength of a hundred divisions. As these recommendations were made they required careful study. The operations of the selective service law promised

an adequate strength in man power, but the old limitations of troop and cargo transport capacity remained to be studied. The capacity of America to meet the increasing financial burden and to produce the necessary raw materials and the manufactured equipment and supplies, had also to be surveyed, for it must be remembered that we had constantly to measure the strength of America not merely in proportion to the military effort which our forces were making, but to add the contribution which the American farm, mine, and factory had to make to meet European allied needs.

The studies of these problems by the War Industries Board and by the Chief of Staff led to the conclusion that we could certainly meet the 80-division program. It was accordingly adopted, with the intention and understanding that it was to be the minimum of our effort and that all that could be added to it would be added to it, in order that in the campaign of 1919 our forces should be overwhelming and the war brought to a close.

The execution of the 80-division program, however, depended upon supplies of artillery to be procured in France, and tonnage for both troops and cargo to be procured in England.

Under your direction I visited both countries. In France the necessary arrangements were made for an adequate supply of artillery. At a meeting of the Interallied Maritime Council in London the tonnage needs for the 80-division program were frankly stated and a resolution taken that those needs should be satisfied if possible. The British Government continued, for our troop transport service, the ships which had been placed at our disposal earlier in the year to meet the emergency caused by the March drive of the German Army. Cargo tonnage also was placed at our disposal. Meanwhile our own Shipping Board further invaded the few commercial facilities which had been left to supply South America and the East with American products upon which they depend.

The result of all this was a great increase in the tonnage used by the Army. It was never adequate to prevent serious shortages in important items in the Expeditionary Forces, but it continued to increase and the production of ships in America finally led us to feel that by March of 1919 it would be possible for us to maintain our increasing army in France and release to very urgent British uses the emergency tonnage placed at our disposal under the arrangement made by the Interallied Maritime Council. Grave fears were constantly being expressed in the United States lest we should find ourselves unable to subsist the growing army in France. The problem was serious, but no chance not justified by the situation was taken and while there could not be much public discussion on the subject, the War Department watched with vigilance the changing aspects of the problem and in the end its judgment was vindicated by the event.

The net result of our effort at the time of the armistice was that from our entrance into the war we had transported to France 2,057,675 men, including marines, but not Army civilians, and up to November 1, 1918, had shipped 4,179,329 short tons of cargo. Gen. Pershing organized a purchasing agency, under the direction of Brig. Gen. Charles G. Dawes, through which he purchased in Europe the equivalent of 4,341,405 short tons of supplies. In part these purchases represented timber, forage, animals, artillery, and transport equipment, all of which were indispensable both to our construction enterprises and to the daily movement and subsistence of the Army. Without them, obviously, it would have been impossible for us to maintain so large a force. The report of Gen. Dawes, as Chief Purchasing Agent, will appear as a part of the comprehensive report to be made by Gen. Pershing. I single it out for comment here only because of the extraordinary zeal and success with which the operations of Gen. Dawes were conducted, and because of relief which his purchases afforded to us in the matter of tonnage, which, of course, was both the most compelling limitation upon our efforts, and the cause of our gravest anxieties.

It seems to me appropriate here to observe that the termination of the war in 1918 was to a certain extent unexpected. When I visited France in October, 1918, plans for the campaign of 1919 were still under earnest consideration. The American 80-division program was, of course, addressed to that campaign. Marshal Foch expressed confident belief in his ability to win the war in 1919, with the aid of 80 American divisions. The plans in this country, as well as those in Europe, were all made in anticipation of operations on a tremendous scale beginning in the spring of 1919.

We had failed to realize the effect of our accelerated troop movement, both in demoralizing the enemy and in strengthening the fighting efficiency of the allied armies on the western front. Had the great troop movement of the summer of 1918 not been carried out, the practically continuous battle on the western front from March to November would not have been possible. The conflicting armies would have stabilized their positions, spent the winter in fresh preparations, and in the spring of 1919 would have opened the decisive campaign. As it turned out, however, the combined strength at the disposal of the supreme commander enabled him to assume the offensive in July, and to hold it aggressively until the exhausted and beaten enemy was obliged to surrender.

The saving to the world in thus shortening the war is incalculable alike in life and treasure. The end came when America had completed but half of her program. It was enough to turn the tide. The full splendor of the strength of our people, however, appears only if one doubles the marching millions who passed through the Argonne Forest, and rested their arms when the armistice was signed. Had

the campaign of 1919 been fought our Army in France would have numbered 4,000,000 men; they would have been supplied from American sources (with artillery as a partial exception) with arms, munitions, and subsistence; they would have had adequate motor and animal transportation, and American-built ships would have insured the safety and adequacy of their supply. Coming suddenly, the termination of hostilities found us with great industrial enterprises nearing completion, vast accumulations of stores awaiting transportation, and with expenditures made from which no actual benefit was derived. These were all a part of the preparation for the campaign of 1919. Until practically the 1st of November the need for such a campaign seemed assured.

DEMOBILIZATION OF PERSONNEL.

Upon the signing of the armistice, it was necessary to throw into reverse the machinery which was at that time working at maximum capacity in pushing troops to France. The problem that now presented itself was the less exciting, although very important, work of demobilization.

The general plan for demobilization of the emergency Army had as its object the transfer of all men prior to their discharge to the demobilization camp in or nearest the State from which they entered the service, and there discharging them.

The purpose of this plan was to induce the men upon discharge to return to the community from which they came, to the end that they might again resume the places in the economic world which they had occupied before they became soldiers.

The following demobilization camps were utilized to carry out the plan. These camps had formerly been mobilization camps to which troops had been sent from local draft boards or other sources for training for overseas service.

Camp Beauregard, La.
Camp Devens, Mass.
Camp Dodge, Iowa.
Camp Grant, Ill.
Camp Gordon, Ga.
Camp Hancock, Ga.
Camp Lee, Va.
Camp Logan, Tex.
Camp Custer, Mich.
Camp Funston, Kans.
Camp Greenleaf, Ga.
Camp Kearny, Calif.
Camp Meade, Md.
Camp Sevier, S. C.
Camp Taylor, Ky.
Camp MacArthur, Tex.
Camp Pike, Ark.

Camp Shelby, Miss.
Camp Sherman, Ohio.
Camp Greene, N. C.
Camp Wadsworth, S. C.
Camp Jackson, S. C.
Camp Bowie, Tex.
Camp Dix, N. J.
Camp Travis, Tex.
Camp Humphreys, Va.
Camp Lewis, Wash.
Camp McClellan, Ala.
Camp Sheridan, Ala.
Camp Upton, N. Y.
Presidio of San Francisco, Calif.
Fort Logan, Colo.
Columbus Barracks, Ohio.

In accordance with cabled instructions from the War Department, the preliminary work necessary to be accomplished in France to facilitate demobilization in the United States was inaugurated shortly after the armistice. The demobilization of the temporary forces in the United States commenced at the same time by orders from the War Department. Since all organizations represented a fair proportion of men from all trades and commercial activities, and as no key or pivotal men had been drafted, the policy adopted was to demobilize by complete organizations as their services could be spared, thus insuring the maximum efficiency of those organizations remaining, instead of demobilizing by special classes with the resulting discontent among those not given preferential treatment and retained in the service, thus lowering their morale and efficiency and disrupting all organizations with the attendant general discontent.

The problem of demobilization of the United States forces was different from that of other countries, since its pivotal or key men had not been withdrawn from industry, nor had its man power been drafted to the same extent as that of our Allies; and while in the beginning there was considerable insistence from various sections for special classes of discharge, the adopted policy was pursued consistently throughout the entire process, no deviation therefrom being made except where the country as a whole was benefited, as, for example, in the discharge of coal miners, railroad men, and certain post office employees, or in well-established cases of distress and where men were essential to industry. In other words, the wishes of the individual were subordinated to those of the country he was serving.

The following brief description of the methods of demobilizing the overseas troops includes the process used for those that did not leave the United States:

All troops upon their departure from France for the United States were reported by cablegram as to strength, composition, and States from which they entered the service, or in which their homes were located. In the case of sick and wounded, the number was given, also whether bed-ridden or requiring no special attention.

Based upon this information, which was received approximately one week before their arrival in the United States, orders were issued by the War Department directing their distribution for discharge to the demobilization camps in or nearest their own States. In the case of sick or wounded, these were distributed to those hospitals fitted for handling their special class of disability which were located nearest the homes of the men, in order that they might be visited by their relatives with the minimum expense. When the sick and wounded had recovered, they were demobilized in the same manner as other troops. In certain cases some men were permitted to leave

the hospital while undergoing treatment, provided they were capable of being cared for by their relatives. As a protection to the country as a whole, no cases of contagious or infectious diseases, such as venereals, were released from Government treatment until they were either completely cured or were no longer a menace to the public health.

Prior to the departure of troops from France, they were subjected to a careful physical examination, disinfection, and provided with clean clothing throughout. Those found with communicable diseases or otherwise sick were separated from the well and placed in separate organizations with appropriate medical attendance.

Upon reaching the United States, the troops were again subjected to the disinfecting process in order that upon their being scattered throughout the United States the public would be safeguarded against the possible spread of disease. En route to the United States, the personnel adjutant assigned to each transport assisted the troops in the preparation of records and reports, and furnished useful information to the end that the work of demobilization might proceed smoothly upon their arrival at the debarkation camp at the ports. The troops en route to the United States having been assigned to their debarkation camp by the port authorities prior to their arrival, the unloading of troops, their transportation and assignment to quarters in the camps at the port were accomplished expeditiously, efficiently, and without confusion.

At the debarkation camps which were operated by the Transportation Service, troops were disinfected, as stated above, surplus equipment taken into store, records verified, completed in whole or in part, troops paid in full and distributed into companies or detachments destined for the same demobilization camp; demobilization camp commanders were advised of the numbers to be sent to their camp, with dates of departure from port and arrival at camp, and the troops shipped thereto for discharge from the service.

Companies of men sent to the United States from France for discharge due to emergency were discharged without delay at a camp near the port, instead of being sent to the camp nearest their homes. These were exceptions to the rule where speed in separating them from the service was the essential element.

Upon arrival at their proper demobilization camp, the following process which was followed indicated the method pursued in the discharge of men of the emergency army. Every safeguard was employed to the end that both the Government and the individual might be protected and that the individual, in so far as it was possible to do so, might be assisted in returning to his former life in the civil world, or placed in some employment suited to his taste and ability.

The soldier about to be discharged was first taken to the medical discharge board where he was disposed of as follows:

If his statement as to his physical condition, and that of the medical discharge board as determined by a physical examination agreed, he was sent to the records team, where his service record was completed. In the event of disagreement, the soldier was sent to a medical board of review which determined the percentage of his disability. He was then sent to the insurance section which prepared the necessary compensation blanks for him and then to the Federal Board for Vocational Training which advised him on the subject of training in order to fit himself to make a living. Upon completion of this routine the soldier went to the records team.

All men who were not in the same physical condition as when they entered the service, and who had not attained their maximum improvement, were retained in the service and sent to a base hospital for treatment.

At the records team each man's records were completed, and as he passed through this team he was asked by a representative of the United States Employment Service whether or not he had a job, or wished one. If he had a job, and was not doubtful of his retention thereof, nothing was done in his case. If he was doubtful he was registered and given a card to his nearest local representative. If he had no job, he was directed to report to the United States Employment Camp representative, where every effort was made to secure a job for him.

After leaving the records team he was, at a scheduled time, sent to the finance officer and paid; to the camp railroad ticket office where he purchased his ticket, and to the train for entrainment to his home or place of entry into service.

Arrangements were made by the camp authorities for special trains in order that men from the same locality might return in a body for such reception as their home people might desire to extend to them. A reduced railroad fare of 2 cents per mile was granted to men traveling within 24 hours from date of discharge as an added inducement to return to their homes without delay.

To enable the people to see organized bodies of troops which had served in the battle fields of France, regiments or other organizations to the extent of several hundred thousand men were stopped at the cities which they represented for parade and reception while en route from the port of debarkation to their demobilization camps.

While at the demobilization camp awaiting discharge, lectures were given on the subject of their war-risk insurance, allotments, compensation, and Liberty loan allotments. Special representatives were at the camp whose duty it was to explain doubtful points, and to assist in protecting the financial rights of the soldiers.

While the troops were en route from France, in the debarkation camps, en route to demobilization camps, at such camps, and en route to their homes the various welfare organizations did everything in their power to provide for their comfort and amusement.

The following table shows the number of officers and enlisted men discharged, by months, from the date of the signing of the armistice to October 11, 1919:

Month.	Officers.		Enlisted men.	
	Number.	Cumulative.	Number.	Cumulative.
1918.				
Nov. 11-30.....	593	593	43,000	43,000
December.....	37,043	37,636	609,000	652,000
1919.				
January.....	23,563	61,199	358,000	1,010,000
February.....	14,913	76,112	263,000	1,273,000
March.....	11,479	87,591	263,000	1,536,000
April.....	12,185	99,776	298,000	1,834,000
May.....	14,622	114,398	383,000	2,217,000
June.....	13,588	127,986	391,000	2,608,000
July.....	16,404	144,390	361,000	2,969,000
August.....	15,986	160,376	151,000	3,120,000
September.....	8,716	169,092	73,000	3,193,000
October.....	8,690	177,782	33,000	3,226,000
Nov. 1-10.....	2,018	179,800	10,266	3,236,263

During the earlier period of this rapid demobilization the problem of unemployment on the part of the returned soldiers presented serious difficulties. The industry of the country was itself in process of reorganization; factories which had been converted to make munitions of war had to be reconverted to peace-time production, contracts for war supplies were canceled, and there was a necessary interval before the channels of trade could be cleared and the resumption of ordinary business effected. Very close cooperation was established with the Department of Labor in dealing with this situation. Weekly reports were received from every section of the country, showing the demand for labor and the extent of unemployment; and for a brief time in some demobilization camps discharges were delayed, except in the cases of men who desired to be discharged, in order not to add to a prevalent surplus in the supply of labor. An agency was set up in the War Department to aid discharged officers and soldiers to find employment. It did not operate an employment agency, but appealed successfully to the chambers of commerce, local councils of defense, business men's associations, and other bodies in the industrial centers and, by giving a certain leadership and direction to their several efforts, greatly relieved the condition.

Throughout the whole country there was an instant response to the appeal of the returned soldier. The old job or a better one awaited him wherever industrial conditions became sufficiently normal to allow his employment. Often employers took their old men back before they had jobs for them, and many made places for men whom they had not previously employed, rather than see a soldier turned away.

The work of the War Department bureau was most effective. It distributed literature addressed to employers, explaining the state of mind of the returned soldier who, having served his country in the field, came back with a larger sense of his relations and a higher purpose in his civil life. It distributed literature also addressed to the soldier, pointing out that success in civil life is due to merit, and that he must, therefore, seek his new opportunity not only on the basis of his past services in the field, but on the prospective value of his work to his employer. Happily, the resumption of industrial activity in the country was speedy, and the readjustments necessary were made without serious difficulty.

The world needs the utmost effort of America as a producer of raw materials and finished products; its depleted supplies can not be made up by so ready a resumption in the war-devastated countries of Europe, where the losses in man power and destruction of facilities has been so great. It is fortunate that this duty laid upon American industry and enterprise can be met by the addition to the ranks of our workers of 4,000,000 young men, many of whom have learned to realize the world's need of their work by what they have seen of the world's losses, and all of whom have been strengthened in body and purpose by the service which they have rendered.

The extent to which our population was absorbed in war work of one kind and another is interesting. Demobilization, of course, meant not merely the demobilization of the soldiers, but readjustments involving the occupations of the civil population. At the time of our entrance into the war the population of continental United States was probably 105,000,000 people, of whom 54,000,000 were males and 51,000,000 were females. Nearly half of the males were old men and boys, and nearly half of the females were old women and girls, so that these two groups, aggregating almost half of the total population, may be considered as relatively not of producing age. With such an assumption the distribution of the entire 105,000,000 population during the war was probably about as shown in the following table:

Occupations of Americans during the war.

	Number.	Per 1,000.
Men in France fighting.....	1,400,000	13
Men in France behind lines.....	600,000	6
Men in Army in United States.....	1,700,000	16
Men in Navy.....	550,000	5
Men in war work in United States.....	7,150,000	68
Men in nonwar work in United States.....	18,600,000	178
Total men of producing age.....	30,000,000	286
Old men and boys.....	24,000,000	229
Total males.....	54,000,000	515
Women in war work.....	2,250,000	21
Women in nonwar work.....	25,750,000	245
Total women of producing age.....	28,000,000	266
Old women and girls.....	23,000,000	219
Total females.....	51,000,000	485
Grand total.....	105,000,000	1,000

The figures of the table give us a basis for classifying each 100 people according to their occupations before the war and during the war. In this classification the number of American soldiers on the fighting line in France has been considered as being substantially equal to the number of American soldiers behind the line in France. This is probably in fair accord with the typical facts, although more than half of the men who reached France saw actual fighting. The distribution is presented in the table below:

Distribution of each 100 American citizens.

	Popu- lation in peace time.	Population in war time.
Producing men.....	29	1 fighting in France. 1 in France not fighting. 2 other soldiers and sailors. 7 civilian war workers. 18 nonwar workers.
Old men and boys.....	23	23 old men and boys.
Producing women.....	26	2 war workers. 24 nonwar workers.
Old women and girls.....	22	22 old women and girls.
Total.....	100	100

A further computation would distribute each 100 men of producing age about as follows:

Fighting in France.....	3
Behind the lines in France.....	3
Other soldiers and sailors.....	7
Civilian war workers.....	24
Nonwar workers.....	63
Total.....	100

Of each 100 women of producing age there would be about 4 war workers and 96 nonwar workers.

The figures illustrate not only the difficulties of demobilization, but they are suggestive also of the intensity and exclusiveness of the mobilization of the man power, both military and nonmilitary, of a nation required by modern war:

RECORDS ON DEMOBILIZATION.

When it became apparent that the armistice was imminent and that demobilization would probably begin in the immediate future, measures were taken for the preparation and disposition of the necessary records, both individual and organizational. The demobilization of such an enormous Army as had been mobilized was unprecedented in the United States, and new forms for accurate record had to be devised and the necessary instructions for the accomplishment of the forms and the filing of them published to the service.

Such forms and instructions were ready and distributed for use when demobilization was ordered.

The individual records of officers and enlisted men were forwarded to The Adjutant General of the Army for proper filing for future reference.

The records of organizations were either forwarded to The Adjutant General of the Army for filing and future reference or were retained at the demobilization camps for use. As one camp after the other was demobilized or abandoned the records were placed at a contiguous camp for file.

It is almost impossible to visualize the great volume of records that for the protection of the Government as well as of the individual soldier must be kept properly filed for immediate reference.

One record, the service record of the enlisted man, upon complete demobilization of 4,000,000 men requires 12,000 running feet of filing space, and this is but one of the several records filed for enlisted men.

For the purposes of demobilization there have been issued to the service approximately the following number of blank forms:

Form No. 135-3 A. G. O. (report of physical examination of enlisted men prior to separation from service in the United States Army), 5,420,000.

Form No. 395-1 A. G. O. (report of physical examination of officers prior to separation from service in the United States Army), 330,000.

Form No. 525 A. G. O. (honorable discharge, enlisted men), 4,775,000.

Form No. 525-2 A. G. O. (honorable discharge, officers), 233,000.

Form No. 525-3 A. G. O. (honorable discharge, officers serving under bureau chief), 30,000.

Inserts for service records of enlisted men, 6,070,000.

Pasters for service records of enlisted men, 6,400,000.

Final indorsement for service record of enlisted men, 5,010,000.

Appendix to file record card of officer, 225,000.

Circular of information concerning war-risk insurance, 5,130,000.

ACTIVITIES OF RESERVE OFFICERS' TRAINING CORPS (INCLUDING THE STUDENTS' ARMY TRAINING CORPS), FOR THE YEAR 1919.

Following the cessation of hostilities consequent upon the signing of the armistice, the demobilization of the Students' Army Training Corps and the reorganization of the Reserve Officers' Training Corps in the schools and colleges of the country was at once undertaken. The discontinuance of the Students' Army Training Corps involved the discharge of 3,961 officers and some 170,000 men, and the settlement with the institutions of 687 contracts involving \$12,535,957.39.

Units of the Reserve Officers' Training Corps were reestablished in secondary and collegiate institutions throughout the country and a comprehensive program was undertaken for the training of candidates for commissions in the Officers' Reserve Corps. Under the emergency authority granted to the President during the war, an allotment of 1,000 commissioned officers was made for the work. By the close of the academic year, June, 1919, units had been established in 191 collegiate and 128 secondary institutions and more than 90,000 students were undergoing instruction. Officers of the Army detailed as instructors numbered 635, assisted by 599 noncommissioned officers. One hundred and fifty-one applications for units, to be organized with the opening of the school year in September, 1919, were received. During the summer of 1919 Infantry training camps of six weeks' duration were conducted for the Reserve Officers' Training Corps at six of the Army cantonments, and a Coast Artillery Camp at Fort Monroe, attended by 3,405 students. With the commencement of the academic year in September-October, 1919, it became apparent that the officer personnel for duty with the Reserve Officers' Training Corps would necessarily be materially reduced, due to the demobilization of the Army and the discharge of temporary officers. The limited commissioned personnel available for this duty has rendered it difficult for the War Department to meet the widespread demand on the part of institutions for the establishment of units and the detail of commissioned and non-commissioned officers as instructors. On September 1, 1919, the Committee on Education and Special Training, under whose control and supervision the Reserve Officers' Training Corps was placed during the war, was ordered demobilized, and such control passed to the Director of the War Plans Division of the General Staff. A branch of this division to be known as the Reserve Officers' Training

Corps Branch was organized for the supervision of all matters affecting the establishment and maintenance of the Reserve Officers' Training Corps.

The supervision of military instruction in schools and colleges under the provisions of General Order No. 48, War Department, 1916 (sec. 56, act of June 3, 1916), General Order No. 70, War Department, 1913 (sec. 1225, Revised Statutes), and the act of April 27, 1914 (issue of rifles and ammunition to schools for purposes of target practice), is also vested in the War Plans Division and directly conducted by the Reserve Officers' Training Corps Branch. These institutions, while not maintaining units of the Reserve Officers' Training Corps, are given Government assistance in military training by the issue of arms, equipment, and ammunition. Army officers may be detailed as instructors if available.

The following table shows the organization of the Reserve Officers' Training Corps on October 31, 1919:

<i>Summary.</i>	
1. Infantry Senior.....	units.. 148
Infantry Junior.....	do.. 127
Cavalry.....	do.. 7
Coast Artillery.....	do.. 21
Field Artillery.....	do.. 22
Signal Corps.....	do.. 10
Engineer.....	do.. 19
Ordnance.....	do.. 10
Motor Transport Corps.....	do.. 10
Total.....	374
2. Number of institutions at which units are authorized or approved for organization.....	269
3. Incomplete reports on enrollment indicate that approximately 100,000 students are undergoing training in the above units.	
4. Schools operating under G. O. No. 48, W. D. 1916.....	23
Schools operating under G. O. No. 70, W. D. 1913.....	15

AMERICAN FORCES IN GERMANY.

About the time that the General Headquarters of the American Expeditionary Forces left France, the Army of Occupation in Germany was greatly reduced, and the designation consequently changed to "American Forces in Germany." As now organized (Oct. 11, 1919) these forces have a strength of 519 officers and 10,399 enlisted men and consist of the following organizations with headquarters at Coblenz: Eighth Infantry; Second Battalion Sixth Field Artillery; Company A of the First Engineers; Second Pioneer Infantry less the First Battalion and Companies G, H, I, and K; Seventh Machine Gun Battalion; Evacuation Ambulance Company No. 26; Field Hospital No. 13; Motor Command No. 41; Motor Transport Companies No. 333, No. 334, No. 335, and No. 336; Butchery Company No. 351;

Field Remount Squadrons No. 311, No. 314, No. 322, and No. 334; Mobile Laundry Company No. 318; and First Supply Train Companies A, B, C, and D.

A provisional brigade, consisting of the Fifth and Fiftieth Infantry and attached troops (Headquarters Motor Command; Motor Transport Companies 737 and 405; Service Park Unit No. 540; Provisional Machine Gun Battalion; and Company D, First Engineers) with a strength of 236 officers and 4,330 enlisted men, is now en route to Coblenz, with a view to its possible use in Silesia.

The question of supplying our forces along the Rhine was at the outset a problem that required serious consideration. For many reasons it was difficult to use French railroads for the shipment of supplies, and after careful study of the situation it was decided that the Rhine should be used as a line of communication for our forces. Accordingly, Base Section No. 9 was created with headquarters at Rotterdam and Antwerp. This base section, which was to be used only for the purpose of transshipping freight up the Rhine, was never used for the Army of Occupation, but is now being put into operation for the reduced Rhine garrison.

AMERICAN EXPEDITIONARY FORCE—NORTHERN RUSSIA.

During the summer of 1918 the situation in Russia presented a problem which demanded serious consideration. The chaotic state of the Government, the distress among the Russian people, the intrigues and activities of German prisoners of war, had produced a situation which had to be met and solved. After careful consideration the Supreme Interallied War Council decided to send an expeditionary force to Archangel in order to prevent the Germans from using that port as a submarine base, and to guard allied supplies which might be there, or which would be landed there in the future. The Government of the United States approved of this project and decided to cooperate in it. Accordingly it mobilized at Aldershot, England, a force consisting of the Three hundred and thirty-ninth Infantry, the First Battalion of the Three hundred and tenth Engineers, the Three hundred and thirty-seventh Field Hospital, the Three hundred and thirty-seventh Ambulance Company, and the Three hundred and tenth Sanitary Train. Col. George E. Stewart, Three hundred and thirty-ninth Infantry, was placed in command of this force and reported for duty to Gen. Poole, commanding officer of the British forces, at Archangel on September 4, 1918.

The mission of this expedition, according to instructions prepared by the United States Ambassador to Russia, was as follows:

As the Government of the United States sees the present circumstances, military action is possible in Russia now only to render such protection and help as is possible to steady any efforts at self-government or self-defense, in which the Russians them-

selves may be willing to accept assistance, whether from Vladivostok or from Murmansk and Archangel. The only present object for which American troops will be employed will be to guard military stores which may subsequently be needed by the Russian forces, and to render such aid as may be acceptable to Russians in the organization of their own self-defense. With such objects in view the Government of the United States will cooperate with the Governments of France and Great Britain in the neighborhood of Murmansk and Archangel.

The forces under Col. Stewart remained in North Russia from September, 1918, to June, 1919. During this time they occupied various positions along the Vologda Railroad and the Onega, Dvina, and Vaga Rivers, and engaged in many minor operations against enemy forces. The following is the list of casualties in this force:

Killed in action.....	109
Died of wounds.....	35
Died of disease.....	81
Died of accident and other causes.....	19
Total deaths.....	244
Wounded.....	305
Taken prisoner (all released).....	4
Total casualties.....	553

After the armistice was signed, it was impossible to remove this detachment, owing to the climatic conditions which forbade the movement of large bodies of troops or large amounts of supplies. In April, 1919, Brig. Gen. W. P. Richardson arrived at Archangel and took command of all troops of the American Expeditionary Forces in North Russia. The One hundred and sixty-seventh Company, Transportation Corps, came at the same time, but stopped at Murmansk in order to cooperate with the One hundred and sixty-eighth Company, Transportation Corps, which had arrived in March, 1919, and was then engaged in construction on the Murmansk Railroad. During the month of June, 1919, all the forces of the United States were withdrawn, except a small detachment of Engineers. In September the last personnel of the American forces in northern Russia were en route to the United States.

AMERICAN EXPEDITIONARY FORCE—SIBERIA.

During the summer of 1918 the Czecho-Slovak armies operating in Siberia were threatened with destruction by hostile forces apparently organized by, and often largely composed of, enemy prisoners of war. It was of importance to the Government of the United States that these friendly Czecho-Slovak forces be rendered assistance and that the Russian people be aided in every way acceptable to themselves in any and all efforts to regain control of their own affairs and their own territory. As Japan and the United States were the only powers in a position to act in Siberia in sufficient force to accomplish the

¹ Includes 28 presumed killed in action.

purpose sought, the Government of the United States proposed to the Government of Japan that each of the two Governments send a force of a few thousand men to Vladivostok, and the Japanese Government consented.

The American Expeditionary Force sent to Siberia was composed of the Twenty-seventh Infantry, the Thirty-first Infantry, one field hospital, one ambulance company, Company D of the Fifty-third Telegraph Battalion, Evacuation Hospital No. 17, Base Hospital No. 93, Medical Supply Depot No. 7, two sections of Bakery Company No. 391, and 5,000 men from the Eighth Division. The command of this force was given to Maj. Gen. William S. Graves. These troops arrived at Vladivostok, Siberia, from San Francisco and Manila in several contingents, and by the end of September, 1918, the whole force had landed.

Gen. Graves disposed his forces at Vladivostok, along the Trans-Siberian Railroad, and stationed a detachment at the important mines of Suchan. In June, 1919, the first minor engagement with Bolshevik forces took place at Uspanka. This was followed by other minor operations against partisan bands and anti-Kolchak forces.

During the summer of 1919 an organized effort was made to procure voluntary applications for service in Siberia and to return and discharge, as fast as possible, all men who were enlisted or drafted for the emergency.

These replacements were sent to Siberia on the dates and in the strengths listed below:

June 5.....	9
July 5.....	67
July 25.....	690
Aug. 15.....	1, 270
Sept. 10.....	267
Sept. 13.....	992
Total.....	3, 315

The following is the list of casualties suffered by the American forces in Siberia to October 1, 1919:

Killed in action.....	28
Died of wounds.....	8
Died of disease.....	41
Died of accident and other causes.....	27
Suicide.....	5

OCCASIONS UPON WHICH IT HAS BEEN FOUND NECESSARY TO USE
FEDERAL TROOPS TO PRESERVE LAW AND ORDER SINCE JUNE
30, 1918.

Since July 1, 1918.—Globe, Miami, Ray, Jerome, and Ajo, Ariz. I. W. W. activities, etc. Detachments of United States troops and United States guards have been stationed at these points. Considered necessary by the governor of the State.

August, 1918.—Columbus, Ga. Street-railway and cotton-mill strikes. United States troops sent from Camp Gordon, Ga., on request of the governor of the State.

September, 1918.—Flat River, Mo. Guarding and preserving order at lead and zinc mines. Detachment of 1 officer and 32 enlisted men.

October, 1918.—Jerome, Ariz. Strike of miners. A detachment consisting of 3 officers and 50 enlisted men, commanded by Lieut. Col. Biegler, was sent to this place to take charge of the strike. This detachment was in addition to the regular garrison thereat and arrived October 25.

November, 1918.—Winston-Salem, N. C. Race riots. Detachment of United States guards, commander, Maj. G. B. Wilcox, from Camp Greene, N. C. Detachment consisting of 18 officers and 250 enlisted men, 2 machine guns, 2 automatic rifles, and 1 small tank, commanded by Col. Clopton, from Camp Polk, N. C. These detachments assumed duties November 17, and the larger part of each returned to their stations November 19, leaving about 100 troops at Winston-Salem.

January, 1919.—Blairsville, Union County, Ga. Disorder was created by certain deserters in the mountains resisting arrest. Detachment consisting of 2 officers and 30 men sent upon request of governor of State.

February, 1919.—Seattle, Wash. Shipyard strikes. Detachment Brig. Gen. Hayden commanding, consisting of headquarters, machine gun company, and two battalions of First Infantry from Camp Lewis, Wash., arrived February 6, 1919.

Tacoma, Wash.—Shipyard strikes. Detachment Brig. Gen. Watson commanding, consisting of one battalion First Infantry and provisional machine gun company from Camp Lewis, Wash., arrived thereat February 6, 1919.

Butte, Mont.—Strike of miners. United States troops, consisting of Company C, Forty-fourth Infantry, from Fort George Wright, Wash., and Companies A and D, Forty-fourth Infantry, from Fort Lawton, Wash., were dispatched to this place for strike duty, Brig. Gen. F. B. Watson commanding. Company E, Forty-fourth Infantry, Capt. W. D. Wilson commanding, was the original garrison at this place. All the United States troops except Company E left for their proper stations February 22, 1919.

Jerome, Ariz.—I. W. W. strikes. A detachment of United States troops stationed thereat handled the situation.

March, 1919.—Gerard, Ga. (2 miles from Camp Benning). Labor strikes. Detachment of 1 officer and 16 enlisted men sent from Camp Benning, Ga., on March 3, upon request of governor of the State.

May, 1919.—Charleston, S. C. Race riots (Negroes and sailors). Detachment consisting of Capt. Everett with 50 enlisted men, Forty-sixth Infantry, upon the request of the chief of police, took charge of the situation.

July, 1919.—Washington, D. C. Race riots. All available troops in the city, 80 officers and 1,153 enlisted men, commanded by Maj. Gen. Haan, took charge of the situation upon request made by the superintendent of the Metropolitan police department.

September, 1919.—Omaha, Nebr. Race riots. Detachments consisting of 11 officers, 152 enlisted men, Fourth Division machine gun company; 13 officers and 190 men, Seventh Division; 18 officers and 512 men, Sixth Division; under the command of Maj. Gen. Leonard Wood, took charge of the situation.

October, 1919.—Elaine, Phillips County, Ark. Race riots. Detachment of 600 United States troops, commanded by Col. Jenks, was sent from Camp Pike, Ark., upon request of the governor of the State. This detachment arrived October 2, 1919.

Gary, Ind.—Strike of steel workers. Detachments consisting of 105 officers and 916 enlisted men, Fourth Division, and 18 officers and 512 enlisted men of the Sixth Division, arrived October 6, Maj. Gen. Leonard Wood commanding the troops.

In addition to the above use of troops, there have been numerous detachments of United States troops and United States guards guarding property and preserving order at munitions plants and other manufacturing concerns. These, however, are considered strictly as military duties with the United States Government.

THE HIGHER EDUCATION OF OFFICERS IN THE ARMY.

Immediately after the signing of the armistice, studies were begun on the revision of the educational system in the Army, with a view to modifying the prewar system where the lessons learned in the war indicated changes were necessary to make the system meet modern military requirements. Studies were prepared by selected officers in the American Expeditionary Forces, France, and by the General Staff in the War Department; the system adopted was based on what was considered best and most practicable of the two studies.

The war demonstrated that there was a necessity for a more thorough and extensive education of officers in all grades and in all classes of military duty; that there was not uniformity of doctrine or

methods in the separate arms, or in the Army as a whole; that our prewar system did not secure progression of instruction in accordance with the advancement in rank of the officer; and that there was not continuity of instruction throughout the entire system from the bottom to the top. Notwithstanding these deficiencies of the prewar system, it was realized that this system had been an evolution of years during which time the United States had had little modern war experience; that whatever the shortcomings of this system, the greatest was that it did not exert enough influence on the training and instruction in the Army as a whole, and, to overcome this, it is necessary to increase the capacity of the different school plants and to establish new ones where necessary.

The war has also demonstrated the necessity for broader scope of instruction of officers in all grades. New weapons and new methods of warfare have made necessary greater knowledge of combat principles and tactics, of supply and of means of communication, on the parts of all officers from the commanders of platoons to the commanders of higher tactical organizations such as divisions, army corps, and armies, and it has been made specially apparent that General Staff officers for duty with the War Department and for larger expeditionary forces should have broader knowledge, not only of their purely military duties, but also a full comprehension of all agencies, governmental as well as industrial, necessarily involved in a nation at war, to the end that coordinated effort may be secured from all these agencies, and that they may be employed economically and efficiently both in the preparation for and during the war.

While the demands on the individual officer have increased, correspondingly have the requirements of the enlisted men, especially in the different classes of noncommissioned officers and specialists of the different arms and services.

With the above consideration in mind the Military Educational System has been put into effect, as far as practicable to do so, by War Department orders. The system embraces special service schools for officers and enlisted men, for each arm and service requiring them, having for their object the development and standardization of instruction and training of officers and enlisted men in the technique and tactics of the respective arm or service. The courses of instruction comprise:

(a) Basic courses for all officers upon entry into the Regular Army so as to qualify these officers that they may function intelligently on being assigned to duty with troops. These courses include instruction on those fundamental subjects common to officers of all arms, and such tactical and technical training in the particular arm, including training methods and principles of teaching, as may be necessary for officers of the lowest rank in the arm or service.

(b) Advanced courses for officers, to continue the education of the officer in accordance with his rank so as completely to fit the graduate for the performance of all duties that devolve upon officers of the respective arm or service as a specialty.

(c) Special courses for officers and enlisted men for the development of specialists in the use of arms and equipment peculiar to the arm or service with a view to providing instructors for troops in these specialties and for the training of selected noncommissioned officers in the duties of junior officers of their respective arm or service.

It has been considered desirable to designate these special service schools by the name of the arm or service operating them, that a better understanding may be had as to their object.

For some of these special service schools the prewar plants are being used. The Coast Artillery School, Fort Monroe, Va., the Cavalry School, Fort Riley, Kans., the School of Fire for Artillery, Fort Sill, Okla., are being so used. For the other arms and services the prewar plants that were formerly in use are not sufficient in number or in capacity for necessities made apparent by lessons of the war, and it has been proposed to retain and make use of for this purpose certain plants acquired during the emergency, so that the needs of all arms and services may be satisfactorily met. Owing to the difficulties in securing necessary personnel as students and instructors during the period of demobilization and reorganization of the Army, and the uncertain status of the new plants for these schools, the establishment of courses at the special service schools to the full extent intended has not been possible. The basic courses and limited courses for specialists have been maintained throughout the year.

GENERAL SERVICE SCHOOLS.

The School of the Line has for its object the training of officers (a) in the combined use of all arms and services functioning with a division, including the functioning of corps and army troops and services, and (b) in the duties and responsibilities of field officers with regard to education and training of the Army. This school was reestablished at Fort Leavenworth, Kans., September 1, 1919, with a class of 150 field officers.

The General Staff School has for its object the training of selected officers for duty as General Staff officers with tactical units and for higher tactical command. In addition, special courses will be conducted for general officers and selected officers of the technical and administrative services with a view to insuring harmonious cooperation throughout the service. The General Staff School is located at Fort Leavenworth, Kans., and a course for the instruction of a class of 50 selected officers began on September 1, 1919.

The General Staff College was established at the War College, Washington, D. C., September 1, 1919, with a class of 75 selected officers. This college, the highest in the school system, has for its object the training of selected officers for duty in the War Department General Staff and for high command. In addition it will conduct such special courses for general officers and selected officers of the technical and administrative services as may be prescribed with a view to insuring harmonious cooperation in the War Department organization and in the military service in general. In addition to study of those subjects of purely military character, the General Staff College will take up studies of an economic nature in regard to supply in general and industrial activities necessarily employed in war with a view to securing cooperation and coordination of the governmental and industrial agencies of the Nation.

While the special service and general service schools are for the military education of the individual, the greatest benefit to be derived therefrom is in the use of the graduates of these schools in the training of troops in general, and in the maintenance of the unit schools for officers and enlisted men.

UNIT SCHOOLS FOR OFFICERS AND ENLISTED MEN.

These schools take the place of the former garrison schools for officers and noncommissioned officers' schools. The primary object of these schools is the instruction and training of officers and noncommissioned officers with a view to securing uniform and efficient training of troops. This requires that, to the greatest extent, the instruction at these schools should be conducted concurrently with and be definitely and closely coordinated with the schedules of training or work of the troops.

It is contemplated, as soon as the educational system is completely organized, to use the schools to the fullest practical extent for the instruction of officers of the National Guard and Reserve Officers' Corps, as provided for by law, with a view to the advancement of these officers in military knowledge and usefulness. It has been impracticable to undertake the work during the present year.

EDUCATION IN THE ARMY SINCE THE ARMISTICE.

After the signing of the armistice immediate steps were taken to discontinue the Army's extensive educational work, which had been developed as a necessary factor in the mobilization machinery, but in doing this, to preserve as far as possible for the future the many valuable lessons in training learned from the war experience.

Early in December the colleges were invited to reestablish the Reserve Officers' Training Corps training, with greater attention to units of the special corps. New regulations have been published

permitting greater emphasis on camp work and closer cooperation between the schools and the War Department in the matter of technical instruction. As a result there are now 351 units in 264 educational institutions with a total enrollment of 100,000 students.

During the winter careful study was given to the problem of reorganizing the various service schools and establishing a permanent educational system for the Army. On the basis of the plans matured in this study, Congress appropriated \$2,000,000 to support vocational training in the Army. The responsibility for the development of the plan was placed on the War Plans Division of the General Staff, and a new branch of the division has been created to supervise this work.

Early in September a general order was issued defining the purposes and policies of education, and camp commanders were instructed to begin such instruction as was possible with the facilities available. As a result, schools are now in operation in 115 posts and, on the average, about 20 per cent of the men are voluntarily attending classes. A comprehensive plan for making effective instruction available for every man has been approved and is being put into effect as rapidly as possible.

Modern war requires soldiers who not only are trained to obey orders but who can act intelligently upon their own initiative in the many instances of modern war where this initiative on the part of the soldier is indispensable. Education for soldiers has been planned to develop their intelligent initiative as a necessary part of their training. The high percentage of technical specialists which the war showed to be necessary for modern armies will be developed by vocational education which will not only produce the necessary trained technicians for the service but will give the soldier a training which will enable him more readily upon his discharge to become a self-supporting citizen. Specific instructions in citizenship and American ideals is considered necessary to produce properly developed soldiers. The plan for the education of the soldier went into active operation November 1, 1919, and will be carried out according to the same high standards that have been insisted upon in the past in the military training and in the administration of the Army. Education has been made a definite part of army activity and will be stimulated, directed, and cared for according to the soundest and most enlightened methods which the educational experiences of the Nation can present.

MORALE WORK.

While the part that morale plays in any organization, military or otherwise, has always been recognized in the abstract, it was not until this war that its development and maintenance was made the subject of practical scientific study and application.

Although the German Armies had developed machinery to deal with morale, it was characteristic that they should have perverted its uses and relied upon falsehoods and trickery to build their own and weaken that of the enemy. Upon the latter they concentrated particularly.

In contradistinction to this method, there was created in the American Army an organization for the purpose of systematically studying conditions responsible for states of mind and behavior flowing therefrom and of applying honest methods of correction and stimulation.

The organization of this work, which finally culminated in the creation of a branch of the General Staff charged with the improvement of the efficiency of the soldier through the betterment of morale, was to a certain extent the natural outcome of the welfare work carried on by various organizations in which the morale element was a by-product; but this was carried out by them separately, usually uncoordinated and lacking any direct relation to military efficiency. But the scope of morale work went far beyond the field of activity of these agencies with every branch of the Army. The readjustment necessary was duplex, implying not only that of persons but of things. It pervaded the entire service. For this reason and in the light of European experience it was realized that maintenance of military morale was strictly a problem for solution by the Army itself.

Although the cessation of hostilities shortly after its creation gave the morale organization but little opportunity to function under war conditions, its work was changed and broadened to meet the needs of the readjustment period of demobilization, in which the ends were no less important. In this phase it is believed that morale work has played an effective part in allaying and removing many of the causes of discontent and difficulties which are usually attendant upon demobilization of large armies.

Morale work has now entered upon its application to the Regular Establishment and is being carried on at all organized divisions, posts, camps, and stations where appreciable numbers of officers and enlisted men are stationed. There morale officers act for commanders in respect to the spirit and mental attitude of men and officers and the degree of efficiency dependent thereon, just as other staff officers attend for the commander to more tangible details of his administration. One of the principal duties of such officers is to furnish the service with ideas which in practical experience have been found to be of value in maintaining the desired discipline and spirit.

In general, it may be said that the aims of morale work are first to have troops in such mental condition that they will be most receptive

to training in time of peace and to psychological stimulation in time of war, and, second, to render the Army as representative as may be of the standards and ideals of the country whose armed force it represents.

It may be noted that the Navy has instituted a morale organization which in many particulars follows the plan developed by the morale branch of the Army and that the idea of stimulation of spirit is also being applied to a constantly growing extent in industrial and commercial organizations.

WELFARE WORK FOR THE ARMY IN THE UNITED STATES.

Early in the war the President, through the Secretary of War and the Secretary of the Navy, organized the War and Navy Department Commissions on Training Camp Activities, for the purpose of coordinating, stimulating, and directing the welfare work for the officers and men in the service. The War Department Commission on Training Camp Activities invited the Young Men's Christian Association, Young Women's Christian Association, the National Catholic War Council, the American Library Association, the Salvation Army, the Jewish Welfare Board, and the War Camp Community Service to undertake such activities as were consistent with the exigencies of the service for the officers and the men in and around camps and posts.

In order to secure sufficient funds for this work, and in order that there might be no financial comparisons between the several organizations thus included, a united drive for funds was scheduled for the week of November 11, 1918, which, in spite of the signing of the armistice, resulted in the subscription of \$205,000,000, of which 58.65 per cent was given to the Young Men's Christian Association, 8.80 per cent to the Young Women's Christian Association, 17.60 per cent to the National Catholic War Council, 2.05 per cent to the American Library Association, 2.05 per cent to the Salvation Army, 2.05 per cent to the Jewish Welfare Board, and 8.80 per cent to the War Camp Community Service. With this money additional buildings were erected, equipment purchased, and secretaries hired for work in the United States, and vast sums of money were sent overseas for the care of the members of the American Expeditionary Forces.

The usual activities of these organizations included such entertainment as moving pictures, vaudeville shows, lectures, and musicians of extraordinary talent, facilities for hours of relaxation, indoor and outdoor games, writing material, religious activities, and, where necessity indicated, educational courses.

In addition to the supervision of the work of the seven affiliated organizations, the War Department Commission on Training Camp

Activities undertook to entertain the men by means of liberty theaters and their accompanying troops of performers, by amateur dramatic entertainments participated in by the talent found in the Army, and by motion pictures. The morale of the Army was greatly increased through the services of the Commission on Training Camp Activities song leaders who developed the so-called "singing regiments." The physical condition of the men was enhanced by a program of athletic sports and calisthenics which was planned to develop coordination of the mind and muscle to such a degree as would enable the soldier to carry on his duties as a fighter while at the same time it gave him diversion from the usual military and physical drill.

In order to carry out the promise of the Government that the young men of the country who went into the Army would be guarded from influences which might produce immoral habits and which would perhaps render them physically incapable of performing their duties as soldiers and citizens, the Commission on Training Camp Activities organized and supervised the law enforcement division, which, through channels of education, cooperation, and the actual enforcement of sections 12 and 13 of the selective-service act, succeeded to a remarkable degree in keeping the men of the service free from the temptation and resultant physical incapability offered by the prostitute and the degrading influences of liquor.

The activities of the Commission on Training Camp Activities were financed by congressional appropriation, private donations, and the Smileage Book campaign, which resulted in the sale of \$3,000,000 worth of coupons, which were purchased by the people and given to soldiers to be used as admissions to Liberty theaters.

The purpose of the Commission on Training Camp Activities and its seven affiliated organizations was to surround the men coming into the Army with as many of the usual comforts and luxuries as were possible under the circumstances. With that in mind, drafted men were received by some representative of the Commission when they entered their draft board, and were accompanied to training stations, on board transports, through their various stages of training in France, and, finally, in a number of instances, to battle. When men began to come back from overseas in large numbers, welfare workers were put on board the transports and remained there as a part of the personnel, giving the returning soldier as many of the creature comforts as seemed advisable, preparing him for the welcome he was to receive from his family and friends, and finally, and of more importance, encouraging his patriotic attitude toward the problem that lay before him in accommodating himself to changed conditions. Assistance was also given him in his quest for reemployment.

With the reduction of the Army to a peace-time basis the question of future welfare work in the Army was discussed by the Third Assistant Secretary of War in conference with many high ranking Regular Army officers, and a decision was reached in May to turn over at a convenient date all of the educational and welfare work to the Regular Army. This decision culminated in General Order No. 109, War Department, September 15, 1919, which established an education and recreation branch within the War Plans Division of the General Staff, charged with the responsibility of supervising and maintaining proper facilities for the education, recreation, and moral training of officers and men in the Military Establishment. Therefore, beginning November 1, 1919, such functions as have been carried on by the Commission on Training Camp Activities and the seven affiliated organizations will be the responsibility of the Army itself.

MILITARY JUSTICE.

The work done in the Office of the Judge Advocate General has of course greatly exceeded, both in importance and volume, its ordinary tasks. Its activities in the administration of military justice have been particularly under comment during the past year.

On April 6, 1917, the total number of prisoners in military prisons was 2,467 and 30 on parole; on the 1st day of November, 1919, the total number was 3,969 in prisons and 67 on parole. This means that although more than 4,000,000 men have been brought into the Army, the processes by which their delinquencies have been adjudicated and the ameliorations of discipline have resulted in a relatively small increase in the total number of prisoners. It remains a cause of lasting pride to the department that throughout the war not a single person was put to death for a purely military offense.

During the progress of the war, the operation of courts-martial led to great unevenness in the matter of penalties, and in some jurisdictions excessively severe sentences were imposed. This seemed at one time a matter of concern to the people of the country, who were not aware of the fact that practically all sentences imposed by military tribunals, whatever their apparent length in years of confinement, are indeterminate, the whole system of penal administration in the Army being built on the theory of restoration to honorable service, restoration taking effect as soon as an amendment of character is sufficiently noticeable to justify confidence in the restoration of the prisoner.

Immediately after the armistice boards of review were set up in the Office of the Judge Advocate General, which reviewed the records of all court-martial trials of persons still in confinement. This work is done, so far as trials occurring in the United States are concerned, and substantially completed as to trials occurring in

the American Expeditionary Forces. These boards of review have undertaken not only to equalize and moderate the penalties imposed, but also to recommend action by way of clemency with a view to wiping out, wherever possible, disabilities incurred by our young soldiers who found it impossible to conform to the rigid discipline and severe requirements of military service. An easy rule for the guidance of this action lay in a reversion to the peace-time limits for offenses established by order of the President as Commander in Chief. The application of these limits brought about the immediate restoration and honorable discharge of large numbers of young men.

Perhaps the most vexatious problem of military discipline was that affecting the so-called "conscientious objectors." Out of the whole number of persons professing "conscientious objection," only 504 were tried by courts-martial. The general results of the trials were as follows:

Tried by courts-martial.....	504
Acquitted.....	1
Convicted and sentenced.....	503
Disapproved:	
By reviewing authority.....	3
On the recommendation of the Judge Advocate General.....	50
Effective sentences.....	450

Thousands of young men whose religious, political, or humanitarian scruples prevented their accepting military service were given noncombatant service. Many of them found it possible later to accept the view of their fighting comrades, and some of the most conspicuous and gallant actions of the war were performed by men who at the outset found military service at variance with the dictates of their religious beliefs.

Of those who were actually tried and sentenced, a few were religious objectors. The term "conscientious objector" came to be applied more or less indiscriminately to persons who refused to serve in any capacity; some of them based their refusal upon political, and others upon social, grounds, so that the phrase as currently used includes all varieties of protestants against America's participation in the war. Some of them were frankly disloyal, some of them revolutionary, some of them probably evidencing little more than mental instability and nervous lesions. These cases have likewise been for the most part disposed of. Disposition was easy where the prisoners found it possible to accept the discipline of confinement and to conform to the rules established for the operation of military prisons. Where, however, men have refused to do even the necessary work of caring for the cleanliness of their own cells, or agitated mutinies and riots in

the prisons, they have complicated the problem of clemency and delayed their own restoration to civil life.

The problem has been, of course, novel to the United States, since we have never before had on any large scale to deal with the soldier brought into service by the compulsory process of law. That it was finally reduced to such small proportions is undoubtedly due to the wisdom of the regulations established by the President, offering alternatives to direct military service, and to the searching examinations into the individual cases made by the expert psychologists and criminologists who aided the department in seeking a just solution of the problem. The subject has been the occasion of much debate and agitation. It naturally appealed to the humane feelings of a portion of our people; but on the other hand, tolerance for the views of men whose conscience led them away from the dangers which their fellow citizens were called upon to face seemed to another part of our people faithlessness to those who did bear the perils of the war.

The War Department has acted on the principle that the defense of the country is a duty inherent in citizenship, and it has not sought to excuse those who declined to perform this duty, whatever the reason. On the other hand, our institutions are conceived in liberty of thought and action, and the War Department has not been either amazed or discouraged to find that here and there liberty has run riot with duty and produced individuals who put the accent in the wrong place and who prefer to be or to pose as martyrs, rather than perform the service so bravely and freely given by the great majority of the arms-bearing population of the country.

The number of cases of final recalcitrancy is remarkably small. That there may have been here and there instances of mistreatment of individual conscientious objectors on the one hand or too great tolerance for their views on the other, may perhaps be admitted as being inevitable, but the general solution of the problem has been most satisfactory. Our whole experience with the administration of military justice has led those most occupied with its administration to the belief that we may now safely proceed to incorporate into the Articles of War some modifications which will preserve for the future the lessons we have learned and make that body of law better adapted to deal in the future with the armies democratically raised and democratically organized upon which the country must always depend. These changes are not revolutionary, nor do they reflect seriously upon the Articles of War as they existed prior to April, 1917.

THE SETTLEMENT OF WAR CONTRACTS.

The termination of hostilities on November 11, 1918, found the War Department committed to a program for the supply of the Army on a tremendous scale. Requirements for munitions of every descrip-

tion had come to absorb a very large part of the productive capacity of the Nation. For many months, established industries, to an ever increasing degree, had diverted their existing facilities from ordinary lines of production to munition making, and had created large additional capacity solely for war purposes. Extensive new enterprises had sprung into being, many of them owned or financed, in whole or in part, by the Government. Everywhere the right of way was given to war orders. In the short course of the war the Government suddenly assumed unprecedented powers over private business and mobilized the industrial resources of the country. Through the War Industries Board the United States had come to exercise a vital control over the distribution of raw materials, the allocation of orders and priorities in transportation. The entire supply of certain commodities, such as wool, was taken over, and in steel, copper and other basic industries, prices were closely regulated. Fuel, food, exports and imports, were all subjected to similar control. The industrial life of the Nation was geared to high speed for production of the means to make war, and in all this the requirements of the War Department far exceeded the demands of other branches of the Government. Although we are but one year removed from the culmination of this great effort, we should not allow to fade from our minds the picture of America's industrial power diverted from its normal pursuits and throwing its tremendous weight into the war in support of our armed forces on land and sea.

At the height of this expansion and with almost no warning came the armistice. An immediate reversal of the procurement program became necessary, but the problem of applying the brakes without a disastrous jolt to the business life of the country involved serious difficulty. It was the plain duty of the United States, not only to protect its finances by reducing its expenditures for munitions no longer needed, but also to facilitate the transition to normal business conditions. In many lines large supplies had already been accumulated, which were now wholly superfluous. Numerous incomplete projects for still greater production could now be stopped. In other cases only a partial curtailment seemed advisable, pending demobilization.

Obviously, the interests of the country demanded that industry speedily return to its normal commercial channels; that labor and capital and the raw material be not continued to be converted into weapons of war, which happily were no longer needed. But how rapidly could this shift be made, particularly in view of the abnormal range of prices and the uncertainty which this created in the minds of every manufacturer in framing his new program? Moreover, there had been an actual physical change in the plants of the country by their conversion to war uses, and reconversion would involve

time and expense. There was a vast amount of raw material in many cases crowding these plants suited for war purposes, but unsuited for commercial production; a vast amount of material in process which could, with difficulty, be reconverted to the ordinary uses of industry. It was in every way an unprecedented situation. Neither manufacturers nor the department had any experience to guide them in attempting to work out a solution. Decisions had to be made promptly; there was no time for lengthy investigations or statistical studies. The immediate question before the department was how rapidly could it curtail production for which it had contracted without smashing the industrial machine and creating widespread unemployment.

Speaking generally, a tapering off policy was adopted so that plants would be largely cleared of work in process and the Government would not have on its hands enormous amounts of semifinished material, useful neither for the purposes of war nor for those of peace. The contracts of the War Department in which it was found desirable to curtail production called for a total expenditure, if they had been carried to completion, of upward of \$6,000,000,000. The department worked out its program of curtailment, so far as possible in cooperation with the manufacturers affected, with the War Industries Board and representatives of the Department of Labor. Manufacturers affected accepted this program and took up the task of the shift back to commercial work with courage and initiative. They could not see ahead, but they went ahead. Thanks to this spirit, in the main the shift back from war industry to commercial work was effected with a maximum of speed and without widespread hardship or distress.

The program for the curtailment of production having been determined, the department found itself, as a result, face to face with a second task of importance and difficulty. The curtailment of production under outstanding contracts necessitated the adjustment of the rights of the contractor under his contract. If the Government had flatly canceled the contracts, the contractor would have had no recourse but to the Court of Claims for the damages sustained by him through the action of the Government. The burden imposed upon that court of trying out the multitude of difficult and intricate cases involved would have not only necessarily imposed a long delay in the settlement of these cases but also the hardship on the contractor of having the examination made and decision reached by those entirely unfamiliar with the history of the contract.

It was determined not to cancel contracts but to suspend temporarily or curtail their operation, pending the negotiation between the department and the contractor of a supplemental contract which

would provide for the curtailment of production and the final adjustment of the relations between the contractor and the Government. The contractors, generally, cooperated in this procedure and accepted the temporary suspensions and curtailments at the request of the department. The work of negotiation of final adjustment was then undertaken.

It was important that the department should deal with contractors, generally, on the same basis. The basis adopted is a simple one to state. First, all articles which are completed under the contract are paid for on the terms provided for by the contract. Second, where the contractor has made expenditures and incurred obligations which do not result in finished products, then the Government reimburses him for his expenditures, protects him in his obligations to subcontractors, and in addition pays him a remuneration for the use of his capital and services which have not resulted in completed products. To state this basis of settlement in more detail, the method pursued is substantially as follows: The contractor is reimbursed for the raw material which he has purchased for the purposes of the contract and is paid interest for the use of his capital which is tied up in that raw material. He is reimbursed for his expenditures on work in process, and in addition, he is paid remuneration up to 10 per cent of the cost for the use of his services and capital on that work in process. If he has subcontracts he is reimbursed the amount which he is obliged to pay subcontractors in settlement of his obligations to them growing out of the curtailment of production under the prime contract. If, in carrying out his contract, he has provided facilities for that contract and in estimating his price has taken the amortization of those facilities into consideration as an element of price, he is allowed that part of the cost of the facilities he would have recouped if the contract had gone to completion. This is the ordinary basis of settlement to a contractor. It is recognized, however, that there may be special elements in a particular contract which prevent a settlement on this basis from affording to the contractor fair and just compensation for what he has done, and in such cases provision is made for additional compensation.

No provision was made in this basis of settlement for the allowance of prospective profits. This was for two reasons: First, it has been the general feeling among contractors that they did not desire to claim profits from the United States for work which they had not performed for the United States and could not perform by reason of the termination of hostilities. Second, if there be a legal claim for prospective profits, it is a claim involving difficult questions of fact and of law which the administrative machinery of the War Department is not adapted to handle. Contractors who feel they have a

right to, and desire to, claim prospective profits can have their rights properly adjudicated in the Court of Claims, but it has been the experience of the department that contractors the country over feel that reimbursement for expenditures made, with some remuneration for the use of their capital and their services in work which had not resulted in completed articles by reason of the suspension of production, furnishes a basis of settlement by the Government which is fair and which they are entirely willing to accept.

An elaborate organization has grown up within the department, energetically engaged in adjusting the postwar contractual relations with private industry. The goal of this effort has been twofold—first, to protect the interests of the United States, and, second, to reach the quickest possible adjustment in each case, realizing that many of the contractors could ill afford to allow large amounts of working capital to remain tied up in unproductive work. Following the armistice, each supply bureau created a board to review outstanding contracts and to assist in determining the extent of curtailment. These boards naturally assumed the duty of negotiating settlement agreements wherever suspensions took place.

In January of the present year there was established the War Department claims board, with authority "to supervise and coordinate the work of the various War Department agencies engaged in the settlement of claims resulting from the termination of contracts or other procurement obligations of the department consequent upon the suspension of hostilities, and to authorize and approve such settlements." The president of this board is the Assistant Secretary of War, who, as Director of Munitions, is in immediate charge of all the procurement activities of the Army. Special members are designated for each of the several bureaus, to coordinate the work of the bureau claims board. While general supervision was thus established, the actual work of negotiating settlements was decentralized in the larger bureaus by the creation of district or zone boards, established at business centers throughout the country.

Thus, in a normal instance, the contractor presents his case to the nearest local board of the proper bureau and arrives at a basis of settlement. Reduced to the form of a supplemental contract, this agreement is forwarded to the bureau board in Washington for its analysis and approval and for final sanction by a member of the War Department claims board. In cases in which neither the local nor the bureau board is able to arrive at an agreement with the contractor, an appeal is allowed to the Board of Contract Adjustment. This board was established shortly before the armistice, to represent the Secretary in the solution of doubts, claims, and disputes arising from contracts then in the course of performance. With the change of conditions it continued to act in difficult cases resulting from the

suspension of contracts and informal agreements. It is composed of experienced lawyers, many of them drawn directly from civil life, who are contributing valuable service in the solution of the legal problems consequent upon the novel relations assumed by the Government toward private business during the war.

Mention should also be made of the War Department board of appraisers. This body was originally organized during the war to determine just compensation for real estate and various commodities requisitioned for military purposes. In addition, it has been assigned the settlement of an important class of terminated agreements, for the acquisition of land or interests therein.

The organization thus outlined includes 42 different boards and has required the employment of a very large personnel, who have earnestly endeavored to meet contractors in a spirit of fairness and provide compensation as rapidly as possible, consistent with the interests of the United States.

Soon after the armistice, a situation developed which for a time threatened to do substantial injustice to a large number of business concerns which had entered upon production for the Government without awaiting the execution of a formal contract. The Comptroller of the Treasury ruled that the law forbade the payment of any compensation for the uncompleted portion of a terminated agreement which was not reduced to written contract in the form prescribed by statute. In many cases the necessity for immediate production had led patriotic business men to make large expenditures based on verbal agreements or correspondence with procurement officers, in the full confidence that formal contracts would follow. In other instances, technical defects developed in supposedly valid instruments. Following the general suspension of work under these informal agreements, the United States found itself, for the time being, without authority of law to adjust its plain business obligations. This situation was presented to the Congress, which responded by the passage of the so-called Dent Act, approved March 2, 1919. This remedial act gave to the Secretary of War broad powers to adjust any agreement, express or implied, entered into for the prosecution of the war, prior to November 12, 1918, and not executed in the manner prescribed by law, with the limitation that prospective profits, other than a reasonable remuneration for work done and expenditures made which did not result in completed products, should not be allowed. The Court of Claims was given jurisdiction to review those cases in which the action of the Secretary proved unacceptable to the claimants.

At the time this act passed the War Department claims board had already assumed supervision over the settlement of all properly executed contracts, and accordingly I deemed it best to delegate to the same board the execution of the new legislation, so far as related

to agreements made within the United States and with its citizens. The War Department claims board thereupon formulated procedure under which claimants presented their cases to the bureau boards already established, or to the Board of Contract Adjustment if the terms of the agreement had not been reduced to writing in any form. The boards were instructed first to establish under their certificates the provisions of the agreements, and then to proceed to a fair and equitable adjustment in each case. The resulting awards are negotiated by the district or zone boards and executed by the bureau boards, subject in all cases to the approval of a member of the War Department claims board. The act of March 2, 1919, thus made possible the satisfaction of many just claims, to the substantial relief of business.

A year has now passed since this department was confronted with the sudden reversal of its military supply problem and the readjustment of its relations to private industry. The task is not yet complete; many of the more difficult and larger settlements remain to be completed, but the greater part has been performed. The following figures as of November 1, 1919, will convey an idea of the progress made:

Total number of contracts and agreements necessitating settlement.	24,988
Contracts and agreements settled and adjusted.....	22,596
Uncompleted portion of contracts and agreements already settled.	\$2,091,435,426.50
Amount approved for payment in final settlement of contracts and agreements already completely adjusted.....	\$252,160,382.42
Amount already approved for payment in partial settlement of contracts and agreements not yet completely adjusted.....	\$78,942,212.70
Per cent of amount paid or approved for payment in final settlement to uncompleted portions of contracts and agreements settled.....	12.5

In addition, there are approximately 2,700 claims pending, based on alleged agreements not yet recognized by the department as coming within the Dent Act.

In other words, thus far settlement has been made on the basis of $12\frac{1}{2}$ cents for every additional dollar that would have been expended if the terminated contracts had been completely performed. A further reduction of this figure may be expected by the ultimate credit thereto of the amounts realized from the sale of material taken over by the United States as a part of the settlements.

It is proper at this time to express to the contractors with whom the Government has negotiated appreciation of the prevailing spirit of cooperation in furnishing desired information and of toleration for the occasional annoying delays incident to so complicated an undertaking. Although the claims as presented have frequently been cut to substantially lower figures, it remains true that deliberate attempts to impose upon the Government have been notably few. In fact, it may be said that the fine industrial morale devel-

oped during the war has continued into the transition period, and has supported the efforts of the War Department to ascertain and liquidate its obligations in the shortest possible time.

When it is remembered that claims growing out of the Civil War and even out of earlier wars are still in course of litigation, or settlement through legislative action, it will be realized how much has been accomplished in the single year which has elapsed since the termination of hostilities. Obviously, the number of contracts, the amounts involved, the variety and novelty of questions raised, all immeasurably exceeded the ordinary business transactions of the Government. Perhaps the principal embarrassment in getting forward with this task has been the necessary changes of personnel from time to time. Officers and civilians who were in the service during the war were often unable to remain without unjustifiable sacrifice, and in many cases it was not desirable that they should remain, since they were key men in important industries, the resumption of which was of the highest national importance. Accordingly, arrangements had to be made to release both those who could not stay and those who ought not to stay; but this deprived the Government of the services of many who had been instrumental in making contracts and in carrying them partially to execution, and who, therefore, were most intimately acquainted with the negotiations preceding the contracts and the modifications in them as the result of experience and operation.

There was, however, a very general realization on the part of all the officers, regular and emergency, in the several supply bureaus, of the fact that the resumption of business in the United States could only be brought about by the completed adjustment of these contracts and the release to normal channels of trade of the capital tied up in the claims of industrial concerns against the Government. Many industries had their entire working capital invested in the claims, and until they were paid, or their claims at least liquidated, it was impossible to proceed with the execution of peace-time orders which began to present themselves. This realization to the business man was a call to further sacrifice for the common good, and there have been throughout the year, and still are, large numbers of men in the service of the Government foregoing assured rewards in private business in order that they may see this thing through and aid in the restoration of a settled and safe industrial condition in the country.

LIQUIDATION OF INTERNATIONAL OBLIGATIONS.

Reference has been made above to the extensive purchases of war supplies in this country by our European allies, and also to the pooling arrangements which were later made, whereby the United States undertook to supply out of its resources certain of the needs

of all the Allies, and they in turn out of their resources undertook to supply us and our Army with things which they were specially equipped to produce speedily and economically. In general, the policy was adopted of placing orders through the Government of the country in which the supplies were to be produced. Orders for artillery for the American forces were placed through the French Government with French manufacturers; orders for toluol for France were placed through the Government of the United States. This method was not exclusive, and contracts were frequently made with the nationals of another government; always, however, under such supervision as to prevent competition or interference with the general system of interallied supply.

Frequently the articles to be supplied were of such novelty or intricacy that no definite price could be fixed in advance; as, for instance, when it became apparent that the allied need for nitro-cellulose powder required the construction of new manufacturing plants, the United States undertook to build the two great factories at Nitro, W. Va., and Old Hickory, Tenn., on the more or less general understanding that they were to be a common source of supply. In the same way, services were performed by each of the nations for the other.

Reference has already been made to the transportation of American troops and cargo in British bottoms, and the transportation of American troops and supplies on French railroads. These movements were too hurried and too extensive to permit the accurate accounting and predetermination of costs which are customary in normal times. In general, the principle was agreed upon that these supplies and services should be furnished by each nation without profit to itself and on equal terms to itself and its associates.

When the armistice came there were necessarily outstanding claims of all sorts for services and supplies among the several nations; sometimes directly between the War Department and the ministry of munitions of France or England, sometimes between the services of supply of the American Expeditionary Forces and individuals or corporations in France, England, or Italy, and sometimes in this country between the War Department and the supply bureaus and war offices of our European associates. The intricacy of these was such that no adequate comprehension of them could be had without painstaking examination of reports covering volumes and requiring for their understanding technical knowledge ranging over the whole field of industry as applied to war. Immediately upon the conclusion of the armistice, the necessity for a liquidation of these claims became apparent. With the President's approval, two agencies were set up for the purpose. The most important of these was the United States Liquidation Commission—War Department. The commis-

sion was composed of Judge Edwin B. Parker, Mr. H. H. Johnson, Hon. Henry F. Hollis, and Brig. Gen. Charles G. Dawes, general purchasing agent of the American Expeditionary Forces in France.

The other agency was a special representative of the Secretary of War to undertake the liquidation of such matters in the United States. In this latter task I was fortunate to have the services of Mr. Chester W. Cuthell.

In general, the work of these agencies was to file on behalf of the United States all claims against European governments and nationals and to receive and settle all claims by European governments and nationals against the United States growing out of the operations of the War Department. The settlement was to take the form of a liquidation, reducing practically to a general balance sheet the reciprocal agreed indebtedness as between the United States and England, the United States and France, and the United States and Italy, striking a balance and determining the net obligation of the debt nation or individual in each instance.

SALES ABROAD.

Attached to this report will be found a preliminary report by Judge Edwin B. Parker, chairman of the United States Liquidation Commission—War Department. Any summary comment upon so extraordinary a piece of work as that done by Judge Parker and his associates in France would be inadequate.

The United States Liquidation Commission was, of course, not created as a sales agency, but the withdrawal of the American Expeditionary Forces made it clear that the disposal of the great accumulations of property in France had to be pushed rapidly and was in reality tied up with the liquidation of claims by and against the American Expeditionary Forces in their relations with European Governments and nationals. I therefore asked the Liquidation Commission to undertake the task of disposing of these stores.

The stores to be disposed of were located all over France, in many places in England, and occupied German territory. They consisted of fixed works such as docks, warehouses, refrigerating plants, power plants, repair shops, manufacturing establishments, additions to trackage, bridges and other railroad facilities, telegraph and telephone lines and exchanges, and even more extensive forms of movable property, including practically every kind of equipment and supplies used by an army operating at a place remote from its base. These movable supplies included railroad engines, cars, cranes, special appliances built in the United States and adapted to European gauge, motor transport equipment in all stages of preservation and repair, from that practically worn out to the new equipment in storage warehouses not yet assembled; machine tools collected for

repairing ordnance, motor transport, airplanes, and Signal Service equipment; clothing, new and salvaged; and foodstuffs, often in containers of special construction and size, packed for overseas transportation but not in a form for ready retail commercial disposition.

Only a small part of these vast forms of property could be returned to the United States. Tonnage preference was given to the return of ordnance matériel and of selected items of property especially needed in the United States; but the great bulk of it remained to be disposed of, and the commission faced a situation in which there was a certain competition for some portions of these supplies among the recently liberated European nations and an inability on their part to supply ready money for the purchases. It adopted for the guidance of the commission the general policy that it was wiser to dispose of these materials in Europe than to attempt to store them until tonnage facilities could be provided for their return to the United States. A vast army of custodians would have been required to have been retained in Europe to guard the supplies, and they were estimated to be deteriorating at a daily rate of about half a million dollars by perfectly natural processes. The full capacity of the French railroad systems was needed for the restoration of French industry, and the transportation of these supplies to the coast for reshipment to America could not have been undertaken on any large scale for a long time.

On the other hand, if the War Department had undertaken to sell these supplies at retail, either to individuals or in large bulk by competitive bids, questions of import duties would have been raised and embarrassing competitions with French industry and commerce would have arisen with possibilities of either serious consequences to the attempt of the French people to restore their own industrial and commercial undertakings to normal, or else intervention by the public authorities of France which would have further delayed disposition of the property. It seemed wiser, on every ground, to transfer this property to the French Government in bulk, if an arrangement could be made to do so at a fair price, thus bringing about the immediate substitution of French custody for American custody, releasing our Services of Supply troops for early return to America, obviating the necessity of establishing an intricate, costly, and extensive sales organization in Europe, and transferring to the public authorities of France the opportunity of disposing of these materials so that they could be applied without disturbance to the needs of their people.

Out of the entire bulk of supplies, some sales were made to various European nations on terms of credit, and under the authority of Congress our surplus medical and surgical supplies in Europe were

turned over to the American Red Cross for use in its European relief work. The residue was happily sold to the French Government for about four hundred million dollars, an arrangement obviously advantageous both to France and the United States.

As to the sufficiency of the price obtained for these supplies, opinions may of course differ. The more I have studied the sale, the more satisfied I have become that it was wise and just. It had the added advantage of closing up a most difficult international question to the mutual satisfaction of the two nations involved, and may fitly be characterized as a work wrought by statesmen as well as a prudent conservation of the property interests of the United States.

SETTLEMENT OF CLAIMS IN THE UNITED STATES.

On the 22d day of January, 1919, I appointed Mr. Chester W. Cuthell special representative of the Secretary of War, with authority to liquidate, under my direction, the relations of the War Department to the several Governments of the European Allies growing out of orders, purchases, and engagements arising in the procurement of munitions, services, and supplies in this country by such European Allies. I attach hereto, as an appendix to this report, a complete statement of the work done by Mr. Cuthell and his associates.

The intention was that the reciprocal claims existing in this country should be worked out and the balance transmitted to the United States Liquidation Commission, War Department, in Paris, there to be entered into the general balance sheets exhibiting the international indebtedness, and to become part of the set-off system by which an ultimate set-off balance in each instance was to be derived. The original expenditures, both for the work of Mr. Cuthell and that of the United States Liquidation Commission, War Department, Paris, was out of funds set aside by the President out of the general appropriation for the national security and defense, and the total amount expended under Mr. Cuthell's direction amounted to \$172,625. The total collections, or balance due the War Department as arranged by Mr. Cuthell, aggregated \$319,464,229. The expense of collection was, therefore, roughly one-eighteenth of 1 per cent of the total amount collected.

The work involved, in this series of settlements, such matters as Liberty engines, nitrocellulose powder, picric acid, cotton linters, and a vast variety of less important and less intricate items. They were worked out in negotiation with representatives of the respective European Governments stationed in the United States, or with the ministries of supplies of these Governments directly by Mr. Cuthell on visits to Europe.

That any such an amount could be adjusted to the mutual satisfaction of all concerned, and approved by the respective Governments,

leaving no unsettled claim to disturb the harmony of our international relations or to drag through a long period of diplomatic negotiation or adjudication, is an occasion of great satisfaction; and that all of these obligations should have been thus adjusted within less than a year is evidence at once of the zeal and earnestness with which Mr. Cuthell and his associates entered upon the task and also of the cooperative spirit in which the heads of the great supply departments of our Allied Governments associated themselves in this effort to clean up and liquidate all outstanding differences. As Mr. Cuthell remarks in his report, in point of money involved these settlements are greater than all of the other international settlements made by our country added together.

LIQUIDATION ABROAD.

The United States Liquidation Commission—War Department, has substantially completed its work. Gen. Dawes, Senator Hollis, and Mr. Johnson have retired from membership and Judge Parker will sail from France with the records in about two weeks. A full and comprehensive report of all the work done will be submitted and published as a separate document, both because of its great historical importance and because of the usefulness of the information to citizens, to the Congress, and the executive departments of the Government.

Representatives of the Treasury Department have been in constant association with the Commission. Mr. E. R. Stettinius, formerly Second Assistant Secretary of War, has also been very generous in aiding the commission with the intimate knowledge he has upon many subjects of international negotiation and contract affecting war supplies.

Many of the items covered in the general balance sheet were, of course, worked out here through the organization of Mr. Cuthell, or by Gen. Pershing's staff in Europe. The very large question of rates for ocean transportation of men and cargo was worked out by Brig. Gen. Frank T. Hines, Chief of the Transportation Service of the General Staff, whose brilliant services in the whole matter of transportation deserve special recognition. The settlements and agreements effected through these agencies were all reported to the Liquidation Commission. The vast bulk of claims, however, remained to be negotiated through the commission itself. They covered not only prearmistice but postarmistice claims, and included practically all claims by and against the War Department for the operations of our armies in the allied countries. The bulk of these transactions can not yet be definitely stated because the final casting of accounts is still in process. It is safe, however, to say that the foreign settle-

ments aggregate a larger sum than those effected in the United States, and the gross claims reciprocally stated dealt with by the commission undoubtedly exceeded seven hundred and fifty million dollars.

Less than a year has been occupied in carrying out these transactions. They are unprecedented in magnitude, either in the international business experiences of men, or in international relations. The costs involved are greater than the annual revenues of empires; the possibilities of international misunderstanding were, of course, limitless. That a satisfactory adjustment has been reached is due alike to the spirit in which our allies approached the subject and the infinite tact, business judgment, and zeal with which Judge Parker and his associates addressed themselves to the problem.

In the excitement of war we found a superb response from men of affairs everywhere who unselfishly set aside their personal concerns in order that they might serve; in the great task of clearing out the war's aftermath the same spirit has been shown. Judge Parker and his associates, Mr. Cuthell and his associates, have deferred their business opportunities and prolonged the neglect of their own affairs in order that they might render services less conspicuous than those of the battle field, but as permanent and valuable in the protection of the good name of the United States and in the perpetuation of sound and amicable relations among the great civilized powers who were associated in the war for civilization.

SALE OF MATERIALS.

When the armistice was signed, the War Department was immediately confronted with the task of disposing of the enormous amount of property purchased for war activities, which would no longer be needed.

The best figures obtainable showed that there was for disposal in this country property which cost the War Department in excess of \$2,000,000,000, and in Europe in excess of \$1,680,500,000.

Under the act of July 9, 1918, making appropriations for the support of the Army for the fiscal year ending June 30, 1919, on the subject of "Sale of war supplies," authorization was granted for the sale, under such terms as were deemed expedient, of property acquired during the emergency. Pursuant to this act, Mr. Crowell, the Assistant Secretary of War, was made responsible for the disposal of the surplus property in the United States; and by his direction a branch of the Purchase, Storage and Traffic Division, known as the sales branch, was set up in December, 1918, under Brig. Gen. C. C. Jamieson, as Director of Sales. Gen. Jamieson was obliged to give up these activities owing to ill health, and Mr. C. W. Hare was appointed Director of Sales on January 7, 1919. Owing to the state of his health, Mr. Hare tendered his resignation on October 21, 1919,

and Mr. E. C. Morse, formerly First Assistant Director of Sales, has been appointed to succeed him.

The problem confronting the Director of Sales was the disposal of the property accumulated in this country, at a time when general industrial conditions were in a chaotic state, in such a way as not to unnecessarily disturb industrial conditions and at the same time realize the maximum return to the Treasury. Producers were endeavoring to get back to a peace-time basis, after working almost entirely on war orders. There was at the time a large percentage of unemployed labor which was being, or was about to be, increased by the demobilization of about four and a half million soldiers and sailors. Late in the spring it was seen that conditions were becoming more stabilized, and producers and labor resumed activities. From then on less thought was given to this aspect and efforts were made by the War Department to put into the hands of the consumer such surplus as subsistence and clothing at reasonable prices, so as to assist as much as possible in reducing the high cost of living.

In order effectively to dispose of this surplus property, it was of course necessary to know the amount of material available for sale, and its location and condition. Very great difficulties, however, have embarrassed the determination of these questions. First, the rate at which our over-seas forces could be returned and demobilized could not be foreseen with accuracy, and the quantities of stores needed for their maintenance until demobilized was therefore uncertain. Second, the size of the Army to be maintained until the declaration of peace and thereafter could not be foreseen, since both questions lay in an uncertain region affected from day to day by changing conditions. Third, the demobilization of the personnel familiar with the material necessitated the substitution of civilian caretakers to whom the stock was unknown, and the very bulk of the supplies was such as to render an inventory impracticable, particularly in view of the fact that the demobilizing army was still consuming stores while the industry of the country, at a slackening rate, was still pouring additional supplies into the stocks, as the result of the tapering-off operations of war contracts. Fourth, a great volume of supplies in Europe, which had been accumulated there for the use of the Army, remained undisposed of, and there had constantly to be considered the possibility of profitably returning at least portions of those supplies to the United States, a possibility which had to be balanced against the national advantage of other uses for the ocean tonnage required in reestablishing interrupted lines of world trade.

In spite of these handicaps, and under the supervision and direction of the office of the Director of Sales, the bureaus of the War Department proceeded with the disposition of surplus property, and to date public sales and transfers with funds to other Government depart-

ments have been made of property which cost the Government \$596,000,000, on which a return of 76 per cent, or \$453,000,000, has been realized.

In addition to the above, transfers without funds have been made, under acts of the Congress, to the Post Office Department, the Treasury Department (Public Health Service), and the Department of Agriculture (Bureau of Public Roads). The property so transferred to date cost the War Department \$66,000,000.

Contracts have been entered into, extending over a considerable period of time, for property aggregating \$90,000,000 cost to the Government, on which it is estimated a return of 50 per cent, or \$45,000,000, will be realized by the War Department.

In all sales involving leased land, wherever possible, the sale was made with the condition that the purchaser would assume all damage or other claims. The amount saved in this manner is unknown, but runs into the millions of dollars.

There were also reported to Congress, as of December 2, 1918, sales to the amount of \$123,000,000, made under the act heretofore mentioned prior to the establishment of the office of the Director of Sales.

The War Department has, therefore, disposed of property purchased for the prosecution of the war, and physically in the United States, aggregating in cost \$902,000,000, at a total return to the War Department of \$687,000,000, including transfers without funds, or a return of 75.3 per cent.

It is estimated that nearly one-half of the total surplus property held by the War Department in the United States at the signing of the armistice has been disposed of.

The surplus property abroad was disposed of through the United States Liquidation Commission for approximately \$627,000,000, of which amount \$400,000,000 represents sale to the French Government. It should be borne in mind, however, that the cost of property acquired abroad was excessive and that the present replacement value of this property is estimated at \$1,000,000,000, thus giving a return of 62.7 per cent.

Summarizing the above figures, it appears that an estimate of the total surplus property held by the War Department, both here and abroad, amounted in round figures to \$3,700,000,000, of which amount \$2,582,000,000 has been disposed of, giving a return of \$1,314,000,000 to the War Department, or a recovery of 51 per cent based on the ratio of return to cost.

PERMANENT MILITARY POLICY.

The act of February 2, 1901, fixed the maximum enlisted strength of the line of the Army at 100,000. The national-defense act, approved June 3, 1916, authorized the increase of this strength by five annual increments to a final maximum of 175,000, exclusive of the staff departments, Philippine Scouts, and unassigned recruits. The present authorized enlisted strength of the staff departments and unassigned recruits, exclusive of Philippine Scouts, is 47,917. The officers authorized for these forces number 11,462, making an aggregate authorized enlisted strength of 222,917 and a total strength of 234,379 to be reached by June, 1921.

The national-defense act also provided for the federalization of the National Guard, and contemplated in this manner the creation of a force with an ultimate strength of 442,800 men and officers, trained in the several States and so apportioned that when assembled at the call of the Government it would constitute 16 divisions containing the same arms and organizations provided for divisions of the Regular Army. The President was authorized in the event of an emergency to put into immediate effect the increases called for by the five annual increments. In both the Regular Army and the National Guard a system of minimum strengths was provided, it being recognized that under normal conditions recruitment would

probably not bring either the Regular Army or the National Guard to full authorized strength. The Regular Army was scattered over the continental United States and in the insular possessions, occupying posts built for the accommodation of companies, battalions, regiments, and brigades; and the National Guard, of course, consisted of citizens carrying on their ordinary civilian occupations, centering their assembly for instruction and drill about their armories and drill fields throughout the country.

At the time of the passage of the national-defense act the strength of the Regular Army was about 94,600 men and 4,725 officers, and that of the National Guard 123,600 men and 8,590 officers. Immediately after the passage of the act there arose the emergency on the Mexican frontier caused by the Villa raid. A substantial part of the Regular Army then in the United States was concentrated along the border, and shortly thereafter the National Guard was called into the Federal service and sent to the border. Immediate efforts were made to recruit both forces, the number of troops on the border reaching a maximum by the end of August, at which time they totaled 160,000 officers and men, of whom nearly 112,000 were National Guard troops. The termination of this emergency was almost coincident with the mobilization necessary for participation in the World War, and both the Regular Army and National Guard were strengthened by voluntary enlistments. Later both forces were strengthened by men brought in under the operation of the selective-service law, and during active operations replacements for all forces were largely from that source.

At the beginning of April, 1917, the actual strength of our organized military forces in Federal service was as follows:

	Officers.	Men.	Total.
Regular Army.....	5,791	121,797	127,588
National Guard.....	3,199	76,713	79,912
Total.....	8,990	198,510	207,500

In addition there were 97,295 enlisted men in the National Guard not in Federal service.

The passage of the selective-service law did not automatically suspend the opportunity for volunteering. The character of the conflict, however, and the industrial necessities of the country made it clear from the outset that the power to determine whether a man was more needed in the military service or in industry ought to rest with the Government, and that it was wasteful, if not dangerous, to allow the patriotic impulses of skilled workers in vital trades to cripple the productive capacity of the country, upon which the

supply of our own Army as well as the military and civil needs of our allies depended. The War Department did not, therefore, actively encourage volunteering and inaugurated no campaigns to secure volunteers, although in deference to the will of the Congress, as expressed in early war legislation, the opportunity was not closed.

This led to an Army theoretically drawn from three sources: The Regular Army, composed of men volunteering for fixed terms of enlistment, without regard to the duration of the war; the National Guard, drafted into the Federal service, and thus, so far as its obligation was concerned, a Federal force, secured by draft but preserving the characteristics of a force of volunteers organized in localities and neighborhoods, and at least having the traditions of State origin; and the so-called National Army, the members of which were selected by draft for the duration of the war, and organized without controlling reference to the State or locality from which the men were drawn.

The plan provided for the organization of 20 divisions of the Regular Army, numbered, respectively, from 1 to 20; 17 divisions of the National Guard, numbered, respectively, from 26 to 42, and such number of National Army divisions as should be required, numbered consecutively from 76 upward. Twenty Regular Army divisions were in fact authorized; of them 7 entire divisions were organized and transported overseas, besides 10,131 men of the Eighth and advance detachments of the Tenth, Eleventh, and Twelfth Divisions, and at the time of the armistice the balance of the 20 divisions were in process of organization and training in this country. All of the National Guard divisions reached France, and the National Army divisions from the Seventy-sixth to the Ninety-second, inclusive, reached France. The following table shows the divisions divided into the three groups and indicates the camps at which they were trained and the States from which they were drawn:

Division.	Camp.	States from which drawn.
Regulars:		
First.....	France.....	Regulars.
Second.....	do.....	Do.
Third.....	Greene, N. C.....	Do.
Fourth.....	do.....	Do.
Fifth.....	Logan, Tex.....	Do.
Sixth.....	McClellan, Ala.....	Do.
Seventh.....	MacArthur, Tex.....	Do.
Eighth.....	Fremont, Calif.....	Do.
Ninth.....	Sheridan, Ala.....	Do.
Tenth.....	Funston, Kans.....	Do.
Eleventh.....	Meade, Md.....	Do.
Twelfth.....	Devens, Mass.....	Do.
Thirteenth.....	Lewis, Wash.....	Do.
Fourteenth.....	Custer, Mich.....	Do.
Fifteenth.....	Logan, Tex.....	Do.
Sixteenth.....	Kearny, Calif.....	Do.
Seventeenth.....	Beauregard, La.....	Do.
Eighteenth.....	Travis, Tex.....	Do.
Nineteenth.....	Dodge, Iowa.....	Do.
Twentieth.....	Sevier, S. C.....	Do.

Division.	Camp.	States from which drawn.
National Guard:		
Twenty-sixth.....	Devens, Mass.....	New England.
Twenty-seventh.....	Wadsworth, S. C.....	New York.
Twenty-eighth.....	Hancock, Ga.....	Pennsylvania.
Twenty-ninth.....	McClellan, Ala.....	New Jersey, Delaware, Virginia, Maryland, District of Columbia.
Thirtieth.....	Sevier, S. C.....	Tennessee, North Carolina, South Carolina, District of Columbia.
Thirty-first.....	Wheeler, Ga.....	Georgia, Alabama, Florida.
Thirty-second.....	MacArthur, Tex.....	Michigan, Wisconsin.
Thirty-third.....	Logan, Tex.....	Illinois.
Thirty-fourth.....	Cody, N. Mex.....	Nebraska, Iowa, South Dakota, Minnesota.
Thirty-fifth.....	Doniphan, Okla.....	Missouri, Kansas.
Thirty-sixth.....	Bowie, Tex.....	Texas, Oklahoma.
Thirty-seventh.....	Sheridan, Ala.....	Ohio.
Thirty-eighth.....	Shelby, Miss.....	Indiana, Kentucky, West Virginia.
Thirty-ninth.....	Beauregard, La.....	Alabama, Mississippi, Louisiana.
Fortieth.....	Kearny, Calif.....	California, Colorado, Utah, Arizona, New Mexico.
Forty-first.....	Fremont, Calif.....	Washington, Oregon, Montana, Idaho, Wyoming.
Forty-second.....	Mills, N. Y.....	Various States.
National Army:		
Seventy-sixth.....	Devens, Mass.....	New England, New York.
Seventy-seventh.....	Upton, N. Y.....	New York City.
Seventy-eighth.....	Dix, N. J.....	Western New York, New Jersey, Delaware.
Seventy-ninth.....	Meade, Md.....	Northeastern Pennsylvania, Maryland, District of Columbia.
Eightieth.....	Lee, Va.....	Virginia, West Virginia, western Pennsylvania.
Eighty-first.....	Jackson, S. C.....	North Carolina, South Carolina, Florida, Porto Rico.
Eighty-second.....	Gordon, Ga.....	Georgia, Alabama, Tennessee.
Eighty-third.....	Sherman, Ohio.....	Ohio, western Pennsylvania.
Eighty-fourth.....	Zachary Taylor, Ky.....	Kentucky, Indiana, southern Illinois.
Eighty-fifth.....	Custer, Mich.....	Michigan, eastern Wisconsin.
Eighty-sixth.....	Grant, Ill.....	Chicago, northern Illinois.
Eighty-seventh.....	Pike, Ark.....	Arkansas, Louisiana, Mississippi, southern Alabama.
Eighty-eighth.....	Dodge, Iowa.....	North Dakota, Minnesota, Iowa, western Illinois.
Eighty-ninth.....	Funston, Kans.....	Kansas, Missouri, South Dakota, Nebraska.
Ninetieth.....	Travis, Tex.....	Texas, Oklahoma.
Ninety-first.....	Lewis, Wash.....	Alaska, Washington, Oregon, California, Idaho, Nebraska, Montana, Wyoming, Utah.
Ninety-second.....	Funston, Kans.....	Colored, various States.
Ninety-third.....	Stuart, Va.....	Do.

In all there were 41 American divisions in France beside some units of other divisions before the signing of the armistice, 7 Regular Army divisions, 17 National Guard divisions, and 17 National Army divisions, and there were in training in the United States 13 Regular Army divisions and 4 National Army divisions.

On the 7th day of August, 1918, General Order No. 73, War Department, was issued in effect creating the Army of the United States. The relatively small contingents both of men and officers who belonged to the Regular Army and National Guard, strictly and so-called, at the time of this order had been submerged in the vast levies brought into the service through the selective-service law. Recruits and replacements had infiltrated every organization with drafted men, and the necessities of the service requiring the transfer of officers had quite obliterated the distinctions existing at the beginning of the mobilization between Regular Army officers, National Guard officers, and emergency officers. In providing for the rapid training of so great a force, it was necessary wherever possible to detach officers from organizations and reassign them to new groups, and very often to take both officers and men from traditional arms for assignment and

service with organizations created for the development and use of the novel appliances introduced in this war and requiring specially selected and trained men for their use. As a consequence, when the armistice was signed we had but one Army—a few thousand men serving in it were still serving under enlistment contracts in the Regular Army entered into before April, 1917, but that number was insignificant as compared even with the authorized peace-time strength of the Regular Army. The vast majority of the force was under a duration of the war obligation of service, and legislation required the discharge of all such men within four months after the formal promulgation of the establishment of peace.

It was apparent, therefore, that demobilization would leave a mere handful of men in the Regular Army. The draft into the Federal service of the National Guard has operated to terminate the obligations of the National Guard under their State contracts of enlistment. Its demobilization, therefore, would leave the States without any National Guard, except to the extent that fresh organizations had been formed during the war. In some States an attempt had been made to organize a force to replace that drafted into the Federal service. In most of the States, however, a temporary force known as the Home Guard had been created. Its purpose was obviously temporary, and it dissolved rapidly. It was not designed to secure Federal recognition, or to constitute a permanent military force, nor was it at any time large enough adequately to perform the duty ordinarily resting upon the National Guard. For this reason, an emergency force had been authorized to be created under the Militia Bureau of the War Department known as the United States Guards into which men were received who for physical or other reasons were not eligible to overseas service, but were able to do the work of plant protection and the maintenance of public order in the United States should emergencies arise requiring the use of military forces for such purposes. The United States Guards and the National Army were, of course, held only under emergency obligations. Demobilization, therefore, meant the practical annihilation of all organized military forces in the United States, and if it could have been instantly effected upon the day of the armistice by the discharge of all officers and men in the Military Establishment under duration of the war obligations it would have left in the Army, or in any organized military force, the surviving officers of the Regular Army, 10,619; about 112,000 enlisted men, largely in certain Cavalry organizations in the Southern Department; and the recently organized National Guard of some of the States as yet by no means adequately trained and equipped. It was, therefore, clearly necessary to develop a project which would preserve an adequate military force, and at the same time not delay demobilization and return to their homes of the men brought into the

service of the Government for the emergency and now properly impatient to be permitted to resume their civilian occupations.

With this purpose in view the Congress was asked to authorize the reopening of enlistments in the Regular Army as authorized by the national-defense act of 1916, and authority was given to receive such enlistments either for one or three year periods. At the time this authority was given a substantial force was still in Europe and the Siberian Expeditionary Force, of course, contained a very large number of men under duration of the war obligations. The War Department, therefore, held out as an inducement enlistment in one or the other fields of these operations. The responses were gratifyingly large as is shown by the following table which gives the enlistments, in the two classes as to duration of service, from the reopening of enlistments to the 1st of November, 1919:

Enlistments since Feb. 28, 1919, showing 1 and 3 year periods.

Week end.	1 year.	3 years.	Total.	Week end.	1 year.	3 years.	Total.
To Apr. 5.....	3,566	2,803	6,369	Aug. 2.....	2,837	1,777	4,614

				Total.....	73,563	63,497	137,060

The experience of this war plainly shows the necessity for a fundamental reorganization of the Army and of the War Department itself. The most striking departures from traditional warfare developed since 1914, are: First, the immense size of modern armies which entail more complicated systems of supply, and require a broader basis of industrial support at home as well as the application of all the most modern implements of transportation both for the mobility of the army itself, and for its maintenance in the field.

Second. The tendency of armed conflict to become a war of positions rather than a war of movement. Heretofore improvements in the art of war have been a sequence of modifications of the means of offense and defense. An offensive weapon is developed by one side which is more accurate or more effective than those in use by the adversary and the immediate response has been the development of a defense in answer to the new attack, the enemy at the same time appealing to the ingenuity of its inventors to produce in time a better weapon of attack than that used against him. But we seem now to

have come to a place where, by the introduction of high explosives and long-range weapons of great precision, the question of defense becomes one of elaborate engineering, and an army must have a system of protective and defensive works which render it almost immobile. One of the immediate results of this development is the vast increase in the proportion of the artillery arm in modern armies—an increase which is further emphasized by the use of curtain fire and barrage as an accompaniment of infantry conflicts.

Third. The introduction of new arms of such highly specialized scientific or mechanical character as to require special training in their use. The most notable of these implements are the airplane, the tank and noxious gases. No one of these implements implies quite so complete a detached use as was formerly true of Cavalry and Artillery. The airplane, for instance, is used for reconnaissance and bombing in the the camps and munition dumps of the enemy, and in remote places back of the enemy's lines with a view to destroying accumulated reserve supplies. The solo-fighting airplane is the guardian of its slower consort engaged in reconnaissance or bombing operations. It is also the attacking force against reconnaissance or bombing operations by the enemy. But the air forces do not operate independently. They must be intimately associated with the troops on the ground, seeking information which will be useful in directing artillery fire and infantry advances, and actually protecting troops on the ground from raking machine-gun fire by low-flying enemy aircraft. Long distance bombing excursions into the interior of enemy country undoubtedly have a depressing effect upon the morale of the enemy, but this more or less independent operation is the less important use of aircraft in war, and, if warfare is to have any humane restraints, will be in the future less resorted to, primarily aimed at accumulations of munitions and supplies. Bombs dropped on an inland city from which the civil inhabitants have not been removed means danger indiscriminately to women, children, and other non-combatants, while at the same time it causes widespread destruction of property without direct military object.

The tank, as yet only at the beginning of its development, is a land battleship, moving in cooperation with infantry advances, breaking down wire entanglements and other obstacles, and attacking, in relative security, positions from which machine-gun fire is holding up the infantry advance. Its operations are plainly a part of the general land movement, but it is a vast and intricate machine, requiring mechanical knowledge and skill far greater than there is time to give to troops not specially devoted to its use.

Chemical agencies in warfare present a variety of problems, and have already raised sharp conflicts of view as to limitations upon their use, if not, indeed, upon the propriety of their being used at all.

Whether or not their offensive use ought to be initiated by a country depends upon a variety of considerations which I need not here discuss, but in any case a modern army must be able to meet offensive chemical warfare with the most scientific protective devices, and must make such studies and give such training as will prevent an enemy from succeeding by mere ruthlessness.

The prewar organization of the American Army was departmental. The department commander had under his command the troops scattered in small units here and there within the geographical limits of his department. There was no opportunity for maneuvers on a large scale; little opportunity for the joint training of troops of the several arms, and, of course, no practical experience in the staff work necessary for the management of great bodies of men. The first step, therefore, in any policy which aims to produce an effective army must be to create a tactical organization in place of the old departmental and geographical distribution. The ideal may be stated as follows:

We should have such an Army in times of peace as will embrace all the arms and all the functions necessary in time of war, and of such size as will permit all arms to be so adequately represented that their peace-time training will produce, first, a body of officers able to administer and command an army in the field, and, second, a body of trained soldiers—each arm of which will be thoroughly trained in its own function and will know what it is to expect in action from the other arms and what, in turn, it must do in order that the other arms may function freely and fully in their fields. In other words, it must be a complete unit army, so that when the emergency comes its increase in size will be by a process of multiplication of existing organizations and functions, and not by the introduction of new organizations and new functions with which new experience has to be had in training or in maneuvers.

The opportunity for such a reorganization of the Army is at the present time most favorable. Great training camps were needed during the war; they were selected in convenient locations, and equipped with buildings adequate to accommodate full divisions with all the necessary adjuncts of corps, army, and supply troops. The expenditures made by the Government in these camps were such that the land value is a relatively small part of the investment, and sound business considerations direct the acquisition of the land merely as a means of salvaging in part the investment already made. When acquired, however, the land, improved by permanent roads, drainage and sewer systems, water supply, electric-light service, and other utilities, will constitute ideal quarters for troops in training. They have their barrack buildings, hospitals, storage facilities, theaters, halls, and offices of administration all provided. They are equipped with ranges for small-arms instruction, and, in some

instances the sites are sufficiently removed from populated sections of the country and sufficiently large to permit practice with divisional artillery. Moreover, the Army now has a body of officers actually trained in battle in the management of these large tactical units, and such a reorganization of the Army as herein described will serve to keep alive and hand on the traditions and knowledge thus gained.

As a result of a prolonged study of the entire situation, the Chief of Staff, with my approval, prepared a bill for the consideration of the two Houses of the Congress. Its purpose was twofold; first, to make permanent the reorganization of the War Department found necessary during the war, and, second, to provide such a Regular Army as would respond to the ideal above set forth.

With regard to the first of these objects, it is to be observed that the bill strengthens the General Staff in its control of the entire Military Establishment. Under the system of War Department administration existing prior to the establishment of the General Staff, the supply bureaus had a large degree of independence. Appropriations were made by the Congress to be expended by the chiefs of the bureaus, subject, of course, to the control of the Secretary of War, and upon estimates provided by him, but without any such current coordination as was necessary effectively to make them smoothly working parts of a great centralized organization. There was duplication of functions, conflict of jurisdiction, and a natural competition among the bureaus, each zealously seeking to preserve the importance of its own function. The history and weakness of this system has been so fully and powerfully stated by Secretary Root that it needs no restatement here. The remedy suggested by him, and adopted by the Congress, was the creation of a General Staff, and the donation to the Chief of Staff of certain functions of control and coordination which greatly improved the situation. But the General Staff found itself under two embarrassments; in the first place, the high degree of centralization which an effective General Staff employs inspired many Members of Congress with the fear that it would grow to be a tyrannical and arbitrary power. The public press of the country was constantly referring to the great German military machine, and to the fact that the great general staff in the German Empire had practically seized the reins of government and was bending the civil, social, and religious life of the German people into conformity to its will. This menacing picture of the transformation of the industrious and romantic people of Germany into a pliant, subservient tool of the military power, had in the background all the time the Imperial General Staff, so that the very name came to be hated and feared by those who saw what such a centralized military autocracy was doing to the soul of a great people. As a consequence, Congress acted with distrust toward the

General Staff which it had itself created, limiting its numbers and circumscribing its functions from time to time.

The second difficulty arose from the inertia and traditions of the bureaus themselves. The chiefs of the bureaus were retained with a fixed tenure of office; in some cases appointment as chief of a bureau was limited to the commissioned personnel of the particular corps—an appropriate enough limitation in highly technical corps like the Engineer and Medical Corps, but inappropriate in the general supply bureaus and particularly inappropriate after the substitution of the detail system in the supply bureaus for the permanent commissioned personnel originally obtaining. The bureaus were headed by aggressive specialists. Each felt that the responsibility for the success of his bureau depended upon him, and resented anything diminishing his authority or narrowing his functions.

As a consequence, the old controversies between the staff and the line of the Army, while modified, were not abated by the General Staff law, and the bureaus yielded reluctantly to coordinations. In part this attitude was due to mere tradition, but in part it was based upon the fear that loss of independence and prestige would increase the difficulty of securing desirable personnel in the bureaus. In times of peace these embarrassments were not serious, but with the advent of the war the whole condition changed. The ordinary markets and manufacturing facilities of the country no longer supplied an easy and abundant field of choice. It became apparent at once that the demands of each of the supply bureaus were so great that they became competitors for a supply insufficient to meet all their needs, competitors with the civilian population and competitors with the allied purchasing agencies which were attempting to supply their own armies and civil populations.

This condition followed inevitably from the size of the purchases necessary to be made for the Army, and the highly special and uniform character of the articles used by it. The Army comprised about one twenty-fifth of the entire population of the country, and it might be assumed that after being taken into the Army they would require and consume about one twenty-fifth of the ordinary articles of food and clothing normally used in the United States, so that the problem would be merely to divert, through Army channels, the same amounts of food and clothing as these men would have used in their homes if they had remained there. The facts, however, are very different. The Army purchased in 1918 far more woolen socks and stockings than the country normally produces in an entire year for the whole civil population. In blankets the Army purchases were more than twice the normal gross production. In part-leather gloves they were three times as great. The purchases of wool for Army use were far greater than the normal annual consumption of

the entire Nation. In many other items, like motor trucks, the Army purchases did not equal the aggregate annual output of the country, but because of the specialized and uniform types required by the Army, diversions of facilities were made necessary, which further complicated the industrial situation.

With commendable foresight the chiefs of the bureaus reached out for supplies of raw materials, with the result that practically the entire available supply of certain items needed by all was under the control of a single bureau. It was obviously necessary to control this situation to eliminate competition and to allocate the available supplies from day to day to the most urgent need. As a result, under the direction of the President, under the Overman law, centralized buying was established as to all articles used by more than one bureau and a system established which worked in harmony with the War Industries Board, pooling the needs of the Army with other needs which had to be supplied by the resources of the country. The system so established and perfected by growth and change should be retained, not merely because of the economies it produces, but because we ought never again to face the necessity of abandoning a system adequate only for the small operations of a peace-time establishment, and creating anew an organization adapted to the emergencies of war after the crisis has arisen.

Those who criticize the organization of the War Department as it now is do so primarily on the ground that it subjects supply bureaus to General Staff control; that is to say, that it places the purchase of commodities under the general supervision of soldiers rather than of business men, and that as the officers of the Army are chosen for an entirely different set of aptitudes and talents and are trained in occupations widely separated from commerce and industry, their control is not businesslike and not based upon a knowledge of business. That there is some truth in this may, of course, be admitted, and yet General Staff control does not mean the exclusion of business experts, but it does mean the subordination of the business specialists to a proper place in a general program. Moreover, the only complete answer to the criticism would be a total separation of the supply bureaus from the Military Establishment. This we had substantially under the old bureau system which produced a long and trying history of disagreement between the producer and the user; differences of judgment between the bureau chief, who was a business man, and the soldiers in the field who had to use the articles supplied.

The Military Establishment of the United States in times of peace is not large enough to engage the talents of highly trained and successful business men to operate its supply departments. No wide range of business talent is necessary. The articles to be purchased are standardized and uniform, and from year to year mere

duplication in purchases, with slight modifications, is all that is necessary.

On the whole it would seem that the retention of the system established during the war cut down numerically to the peace-time needs of the Army would be the wisest course. We would then have an organization built upon correct lines, adapted to function in an emergency, and when war came it would be necessary only to enlarge the organization, bringing in business men and experts in large numbers from civil life to carry on the greatly increased services of supply.

The second object of the bill was to authorize an Army which could be effectively trained and multiplied in a crisis. In round numbers the recommendation was for 500,000 men. As compared with the prewar Army this number seems large, but it must be remembered that several new arms have been shown to be necessary in an army. The Air Service, the Transportation Corps, the Motor Transport Corps, and the Tank Corps are all new organizations to be provided with both officers and enlisted personnel. In addition, the size of a division and of the subordinate units has been increased, with corresponding increases made necessary in the auxiliary services. The organization suggested was practically one field army divided into corps and divisions.

The recommendation was not based upon an attempt to forecast any particular state of international relations, or to provide for the assumption of international duties requiring the use abroad of American troops. It did, however, recognize the fact that the National Guard of the country has for the most part disappeared and that it would be some time before it can be effectively reconstituted. It took into account also the possibility of some system of universal service based upon the training of young men in association with Regular Army officers, and, of course, requiring trained officers and noncommissioned officers in larger numbers than the strength of the Regular Army, without that, would justify.

This recommendation has been suggested to indicate a disinclination on the part of the War Department toward the prospect of international disarmament, but the suggestion is without real basis. The professional soldiers of the United States love their profession; they think of it as a high and dignified calling, and one which it is honorable to pursue so long as the arbitrament of war remains as a means of international adjustment. Those who know the spirit of the American Army will not ascribe to it any provocative temper. There is glory left in the career and the sacrifice of the soldier, but the mild and spectacular contests of an earlier age have become a stern and cruel business in this age of industry and ingenuity, and while there is cheerful willingness to encounter the privations and make the

sacrifices which war demands, the men of the American Army are abreast with enlightened men everywhere in the hope that more humane and rational processes of adjustment will supersede the waste and loss of armed conflict. They are, however, of the belief that so long as it is necessary for us to maintain an Army at all we are not justified in having an inefficient Army, and their recommendations are to be viewed not as separating them in spirit from their peace-loving fellow countrymen, but as setting them apart as men who, by reason of their experience, are qualified to speak upon the provision which should be made for the common good and the common protection should the test of war become unavoidable.

After all there are two important considerations to be remembered in this matter; first, we Americans have a traditional belief that large standing armies are a menace to free institutions. That such armies were at one time a menace is clear; though the argument is much overstrained which makes a menace of an army of citizens drawn for a brief period from the common life of the country, because in former times an army of professional soldiers monopolizing military knowledge, and constituting a superior caste under the patronage and control of a despot, was such a menace. It is difficult to believe that an army could be formed of Americans, educated in our common schools, raised in the free and democratic atmosphere of our institutions, conscious of the blessings which liberty and political equality have brought to us as a nation, and which would still be hostile to those institutions and liberties. The World War has shown quite clearly that armies reflect the spirit of the people from whom they come rather than create a spirit of their own, so that the size of the army is not so important from the point of view now under consideration as the kind of an army.

The other point to be remembered is the cost. European nations have groaned under the burden which the maintenance of their great armaments has imposed. It is economically inadmissible to consider fastening upon the people of this country a great body of idle and unproductive men withdrawn from industry and trained merely to be held in readiness, at great annual outlay, against the emergency of war. Indeed, it is greatly to be doubted whether men could be found to enlist in such an Army. The aspirations of American youths draw them into occupations which promise training for higher usefulness, and mere military training has no market. There are, in fact, just three ways in which men can be gotten into an army: (1) By compulsion, (2) by money inducement, and (3) by making an enlistment in the Army an educational opportunity.

The country has accepted the principle of the selective-service law as the fair and democratic mode of assigning men to military service

in war, but compulsory service in time of peace the country has not accepted, and its application would be a poor substitute for the volunteer principle properly applied.

The second of the possible plans of raising an army, namely, by a money inducement, calls upon the Government to enter into competition with industry, and imposes an impossible financial burden. It brings the volunteer in upon a lower basis than compulsion, as there is no idea of national service, and none of personal development or advantage beyond the mere pay received.

The third of these plans, however, is in harmony with the genius of our institutions. It contemplates the establishment of a system of training divided into two parts, the first military and the other educational and social. The second part of the plan looks to the establishment of systems of schools adapted to the needs and aptitudes of the men, teaching the formal branches of education and adding to them the skilled trades, so that at the end of a term of enlistment, the young man entering in his nineteenth year will go back to civil life with the physical set-up which the open, athletic life of the Army gives, and with the education and training which will make him more valuable in civil pursuits than he could otherwise have been. And this system of training and education must be complete and carried out not half-heartedly, but whole-heartedly and surrounded by social and recreational opportunities supplied by the Government and administered by wise and sympathetic men, so that the graduate from the Army will have been to school and will bring back with him the social virtues which result from education of mind and hand acquired in an environment made stimulating by the presence of a high purpose and sense of service, and generous association with his fellows. An army trained in such a spirit would be an effective weapon for the protection of the national interest; it would not be an idle and unproductive body, but would be an invaluable addition to the educational facilities of the country, and incidentally it would repeat year after year the great fusing operations which we saw in the war, whereby men of all tongues and races, and from all the widely scattered parts of our own great country, were brought together in intimate association and taught to interpret and appreciate alike the solid foundations upon which liberty and progress rest in a democracy.

The military policy recommended by the War Department, therefore, involves a new Army created with a new spirit, having wide civic usefulness, and of such size and organization as to be an adequate reliance in case of need.

At another place in this report will be found some comment upon the educational activities of the Army created for this war, both before and after the armistice, and some description of the plans already

matured for continuing the spirit they have developed. Those comments are to be considered in connection with what is here written on the general subject of a permanent military policy, as the whole of the plan as conceived is based upon and justified by the educational value of service to the men. It is not my purpose and it would not be just to criticize the Army of the United States prior to 1917. It was frankly built upon an entirely different theory; but when it came to the test of war it proved its loyalty and its efficiency by its success—a success not alone in winning an ultimate military victory, but a success in expanding its own organization and spreading its knowledge over vast numbers of men, so that it may be fairly said that our Army grew in efficiency as rapidly as it grew in numbers, a thing which would not have been possible had the officers of the Regular Army not been themselves eager to learn and teach, hospitable to new ideas, and generous in the recognition of the ability of others to serve.

There were, however, officers in the Regular Army and others from civil life, who did not understand the psychology of the citizen recruit, and who misconceived the basis of discipline among men drawn to the ranks by an exalted sense of national duty. They continued to regard the "enlisted man" as a soldier who had volunteered into an occupation. This resulted sometimes in resentment and often in the feeling that there was a lack of sympathy and understanding on the part of officers. Incidents of this kind were not perhaps very frequent, but they were frequent enough to show that in the new army such possibilities must be excluded. In order to exclude them, the soldier in times of peace must be worthily engaged, occupied with self-improvement, filled with aspirations for success in civil life and, having an active part in military service, feel that it is to him a combination of an opportunity to serve his country and an opportunity to equip himself for higher things when his enlistment is over. Officers will inevitably see that discipline of such men does not rest upon mere compulsion, but requires leadership and democratic recognitions, and the men will see that their officers are not a caste or a class but are, in a happy sense, their leaders.

The permanent military policy here suggested then embraces, first, such reorganization of the War Department as will preserve the efficient instrumentalities which have been developed during the war; second, an army which will be adequate in size to be the nucleus of any great military mobilization the country may be called upon to make; and third, an army of officers and men to whom the whole experience of military service will be an opportunity for self-development and education, the officers becoming a permanent corps of experts and the men a body temporarily devoting a portion of their time to military training in order that they may enter civil life with

a sense of national service and with superior equipment for success. The accent is not upon the soldier, but upon the citizen, in such a policy.

AN INDEPENDENT AIR SERVICE.

The airplane was developed during this war from small beginnings into an instrument of the highest importance. When the war broke out, only a few years had intervened from the first successful attempts to fly heavier-than-air machines. The European belligerents immediately devoted their best talents to the development and production of aircraft, and throughout the war the progress was rapid and continuous, so that each year the best machines of the previous year were out-built, and extraordinary progress was made in speed, certainty of action, stability, and carrying power. This carried the war into the third dimension and raised new questions as to the relation of aircraft to the prewar military and naval establishments. Air raids upon great unfortified cities like London and Paris brought into the war a new element and constituted an abandonment of the time-honored practice among civilized peoples of restricting bombardment to fortified places or to places from which the civil population had an opportunity to be removed. The practice was a part of the ruthlessness with which the Central Empires sought to terrify England and France into submission.

The actual loss of life caused by these bombardments was relatively small and the destruction of property, while large, had no appreciable effect upon the war-making power of either nation. Indeed, it may rather be said that the willingness of the enemy casually to slaughter women and children, and to destroy property of no military value or use, demonstrated to England and France the necessity of beating so brutal a foe, and it is most likely that history will record these manifestations of inhumanity as the most powerful aids to recruitment in the nations against which they were made.

There naturally grew up a system of antiaircraft defense, consisting of specially devised and adapted guns strategically posted on land, observation stations and systems for transmitting the alarm at the approach of hostile aircraft, and specially devised fighting airplanes for attack, to either drive off or destroy bomb-carrying enemy planes. They led also to a determination to retaliate by similar raids back of the enemy lines. Upon the wisdom of this course there was much discussion, the more humane elements of opinion resisted being drawn into such a course, while an angered section of public opinion felt that the enemy was one having no philosophy but success, and no restraint of fear of the consequences. The geographical situation of England made it peculiarly subject to attacks of this sort, and there, therefore, grew up in England a sentiment in favor of an independent force which, disassociated from the other military operations of the

Allies, could carry out independent bombing operations on such a scale as should be necessary to protect English women and children by making the Germans fear to continue a mode of warfare which no humane instincts seemed able to restrain. For a variety of reasons into which it is not here important to go, but which have in part to do with the heavy tasks already laid upon the traditional military establishments and in part with the novel and rapid development of aircraft, the Air Service was given an independent status, although, of course, such Air Service as was necessary to act in immediate cooperation with either military or naval forces was placed under the respective command of the Army and the Navy.

When the armistice came, all the nations which had been engaged in the war faced a reorganization of offensive and defensive military agencies, and the question at once arose as to how far air fighting and the production and development of airplanes constituted so separate a problem as to justify separation from the Army and Navy, both in peace time and in war. This discussion has gone on in our own country, and bills have been introduced in Congress which aim to create an independent Air Service, some of them going so far as to create a new department of the Government, with a member of the Cabinet as its head. Proposals on this subject have ranged the whole way from complete separation and independence to the separation only of the technical work of design and production, and apparently much of the difference of opinion on the subject is due to the varying optimism and enthusiasm as to the possibility of future development of the airplane with which the subject is approached.

In its very nature, the navigation of the air is a subject to fascinate the imagination. We are all becoming accustomed to these great mechanical eagles outflying the birds, vaulting through space and performing dazzling and terrifying aeronautical feats in defiance of all the limitations upon human movement to which we have been used; but each day seems to bring forth from the imagination of those who are making these contributions to our knowledge promises of even greater exploits. Sober men now speak of devices which will enable heavier-than-air machines to be sent 50,000 feet above the surface of the earth and there attain speeds which destroy the old relations of distance. The art itself is so new and so fascinating, and the men in it have so taken on the character of supermen, that it is difficult to reason coldly, and perhaps dangerous to attempt any limitation upon the future based even upon the most favorable view of present attainments. Nevertheless, there are some considerations which, when stated, enable us at least to see clearly the present problem.

In this war the airplane was primarily valuable for observation purposes. The old war of movement gave place to a war of positions

by reason of the vast forces engaged and concentrated upon a relatively short frontier. The cavalry arm had little opportunity to perform the function usually allotted to it; knowledge of enemy movement of troops for the purpose of massing and supplying them at concentration points for attack was therefore largely secured through aerial observation from balloons and airplanes. Photographing the enemy lines and territory back of them was also an important source of information. Each side sought to gain as much information in this manner as possible, and to prevent enemy observation by anti-aircraft gunfire and by fighting airplanes armed with incendiary ammunition which burned up the gas bags of balloons or by gunfire drove off or destroyed enemy airplanes. In addition to this, airplanes undertook extensive bombing operations for the purpose of destroying railroad centers, ammunition dumps, and factories, and dispersing massed troops back of the enemy's lines. Their effectiveness in these operations was, of course, diminished as they were forced to operate at higher and higher altitudes by the development of antiaircraft artillery, and increased from time to time as scientific instruments lent greater precision to bomb dropping. In addition to these operations, airplanes were indispensable in the control of artillery fire and were frequently used to harass and delay marching infantry columns by low altitude flying and machine gun fire.

How far the airplane by being armored to resist shrapnel, or by the perfection of its scientific instruments can be developed so that its bombing operations will obtain more serviceable certainty, can not be foretold; but it is interesting to note that although the Germans developed the bomb-dropping machine and used it extensively, the direct damage inflicted was relatively small. In the American Army, out of 222,252 casualties admitted to hospital as a result of battle injuries, only 141 were occasioned by airplane bombs. These figures must not be taken to indicate that air bombing is not an important military operation, although they do seem to show that if the aerial bombardment of back areas and inland cities be excluded, as it should plainly be excluded upon the most elemental ethical and humanitarian grounds, then the usefulness of airplanes for observation purposes and for fire control in the present state of development of aeronautics far outweighs their effectiveness as implements of direct attack upon enemy forces. In such matters, however, it must never be forgotten that we are at the very beginning of possible developments; indeed, the air armament actually used in the war is now practically obsolete, and machines were in the process of perfection when the armistice came, and undoubtedly others will be rapidly devised, which will necessitate even more radical modification of military practice than those already in use. The aerial bomb, either controlled by wireless from a mothering

consort, or under gyroscopic control from the point of release, is already a practical implement. Such bombs, carrying very large quantities of high explosives and having no pilot whose safety is involved, could even now be launched, travel with remarkable accuracy a predetermined route and, by wing collapse at a predetermined distance, effect wide destruction. It is at least a possibility upon which serious men are thinking, that such bombs may some day replace heavy guns and make obsolete the whole practice of building long-range artillery which must either be fired from fixed emplacements or is at best moved with slowness and difficulty from place to place.

The uses and possibilities above described are, however, all essentially military and, so far as land operations are concerned, are merely an extension into the air of the modes of attack, counter-attack, and defense land armies are accustomed to use. In their nature, they depend upon land forces for their preparation and control, and in some part upon the land forces for defense even against enemy air attack. Moreover, the particular services rendered by aircraft so far are to lend knowledge to the operation of land forces with which they are in cooperation, and those who realize the extent to which victory in warfare depends upon concentration of the control of combined operations will perceive the seriousness with which any proposal must be viewed which undertakes to separate services which must be so instantly knit together when the time for action arrives. Nobody would think of suggesting that artillery should be a separate service, or cavalry, in any other sense than that they should have their experts giving special attention to their development, but all the time in immediate cooperation with the other services and under the control of a single command. Nor would temporary control, asserted merely for the purpose of combined operations, be enough. The whole purpose of military training and discipline is to inculcate a series of habits of cooperation and obedience which will leave as little as possible to be learned when the hour of trial comes. The uniform, the spirit of membership in the Army, the fellowship of constant association, the experience of constant cooperation, the knowledge which each arm of the service has of the functions of the other arms of the service, the ways they fit into, supplement, and support one another, the extent to which they can be relied upon, all form parts of the material of success, and that commander has the best army whose men from top to bottom realize the extent to which the performance of duty by each is the predicate upon which the successful performance of others depends.

For these reasons, it would seem unfortunate to have an independent military air service, to be brought into cooperation with a land army either for particular or general operations, and the analogy

of joint land and water operations against seacoast emplacements is not helpful, as there can be no such intimacy or correlation between the land and the seas as there is between the air and the land. It is plainly better for the military air service to be military, to have its soldiers and its officers trained in the same school of discipline and trained together as often as possible with the men of the land army, and to have, wherever possible, interchange between the two so that each will feel in the most intimate possible manner its relation to the other. To separate them makes them rival services with the whole train of evils which such rivalry creates, evils which in peace time mean contention before Congress for unbalanced appropriations, grievances and fretfulness about relative rank and rapidity of promotion, and in time of war the substitution of combined service prides for a single emotion of pride in one service.

These very obvious considerations, however, by no means exhaust the subject, for the airplane presents not only the possibility of military usefulness, but the prospect of civilian usefulness to which at present we have not the means of setting any limit; and there are some primary facts about the production of airplanes which enter into this problem with commanding force. In the first place, airplanes are very expensive. Their initial cost is high and apparently always will be; because of the peril involved to those who operate them they must be constructed of the best and most carefully inspected and selected materials, and by the most highly skilled, and therefore highly paid, mechanics. They are frail, easily injured, costly to repair, and rapidly worn out, and these qualities seem more or less permanent; so that even if relatively stabilized types were devised and the maximum economies of quantity production obtained, they would still be extremely costly as compared with other means of transportation and other military equipment.

In the second place, the art is new. Its development requires concentration of inventive genius and stimulus to invention. The cost of experimentation on a proper scale is beyond the reach of private means. A really progressive airplane industry in the present state of the art can not be maintained except with the Government as a prospective purchaser, and if the sole purpose for which the Government makes appropriations is the development of war machines, the commercial possibilities of aircraft will be neglected, which would be a detriment both to the general industrial progress of the country and to the Army itself, since the Army has an interest very real, if more remote than its immediate military interest, in having available for its use the most highly developed agencies of transportation to be used as a supplement when unusual speed is required or difficulties otherwise insuperable are to be overcome.

Third, if military aviation is to attain its maximum development, it should be as a specialized branch of a general practice; that is to say, ideally considered, flying should become a very common thing, with large numbers of men trained in the elements of the art and in its daily practice, with landing fields conveniently placed about the country and mechanics and facilities for repair accessible practically everywhere. In this situation, an emergency would find the country able rapidly to recruit its air forces by taking into the military service those who in the practice of the art generally had shown special aptitude and fitness, and it would be necessary to add only the military training and special knowledge of military aeronautics. For obvious reasons, no country can train and maintain in time of peace such a number of aviators as it would need immediately upon the outbreak of hostilities, and it would greatly expedite the increase of the air force if the Army could find, ready to its hand, a great number of partially trained men.

It seems to me clear, therefore, that the development of aeronautics must depend upon national patronage and support; that if we are to have an industry ready to produce military airplanes in large numbers rapidly in the event of need, such an industry will have to be built up in time of peace and maintained at least to the point from which rapid expansion is possible without the delays necessarily incident to the inauguration of new industrial enterprises and the training of entirely new organizations for production. It seems clear, too, that the industry must to a certain extent be under national control, as must flying itself be under national regulations. Even if it were profitable, private enterprise could not be given a free hand to develop and manufacture airplanes to sell them freely as articles of commerce, imposing upon the purchaser the whole responsibility for the use he makes of his purchase. There must be regulations which will require training before men can be permitted to navigate the air and expose to peril both themselves and the lives and property of others over whom they may fly. Laws of the air, like laws of the road, must be made and enforced. All of these look to Federal regulation and control.

The answers, therefore, to the questions involved in the future of the air service are not simple, and dogmatism is out of place. Just how far the national interest will justify Congress in making appropriations for experimentation and for the maintenance of the airplane industry, how concentrated in time these appropriations should be made, what agencies of development and control should be organized, the extent to which centralization would be helpful, are all questions to which the answers of enthusiasm and of doubt are alike open to objection. A sound national policy, however, would seem to involve a generous attitude on the part of the Congress in the

matter of appropriations, recognizing the commercial possibilities of the airplane by encouraging its use in the Postal Service, and of course recognizing its tremendous importance both to the Army and the Navy. Having determined how far these various possibilities justify support, an aggregate appropriation might be made to be expended under the direction of the President upon the advice of a board of which the Secretary of War, the Secretary of the Navy, the Postmaster General, and the Secretary of Commerce would be members. Such a board would inevitably consider the special needs of the military and commercial interests and would watch from day to day the developments of the art as it promised greater usefulness in one or the other direction.

By such cooperation of the special services, an interchange, if not a direct pooling, of engineering could be effected, and ultimately training could be arranged to be given to civilian aviators in the same schools and with the same facilities as are used in the early stages of the training of military and naval aviators. Such a board could appropriately advise the President upon the matter of flying regulations, and the President could in turn bring legislation to the attention of Congress.

By the use of the aggregate fund thus placed under the President's general direction, encouragement to the extent of the funds available could be given to the industry, and the orders for Government account so placed as to maintain as extensive facilities as possible for the rapid production of specialized types of aircraft in the event of emergency. Such a board could also bring into the field of its general study and operation the manufacture and use of lighter-than-air craft, and it may be worth while here to observe that with the quantity production of noninflammable gas the possibilities of the rigid and dirigible balloon are in many ways as promising as those of the airplane. As the Chief Executive, having under his constant care the commercial and industrial development of the country as well as the national defense, the President would undoubtedly cause himself to be advised from time to time as to the best distribution of jurisdiction in this field, and by assigning to the Army and Navy the functions which can best be performed by them, respectively, and by bringing to a common view the needs of the military establishments and of commerce, the best results could be obtained.

On the whole case, it seems quite clear that the time has not come to set up an independent department of the air, there being as yet no commercial use nor likelihood of the commercial use of the airplane which will prove profitable enough to maintain the industry, and certainly no such prospect of independent effectiveness of aircraft as an agency of war to justify reliance upon it to the detriment of the traditional military arms. As a matter of fact, in war, as yet, the

infantry is the backbone of military effort, and all other arms on land, on the sea, and in the air, are mere aids to its advance and protections to it while it is performing its functions of advance and occupation.

THE ADJUTANT GENERAL'S DEPARTMENT.

The volume of work in this office increased to vast proportions during the fiscal year 1919 and was in direct ratio to the steady and enormous increase in the strength of the Army itself. This did not decrease, however, but rather increased, with the process of demobilization. Some idea of the increase of work may be gathered from the following statistics:

In 1916 the average number of pieces of mail received and handled daily was 3,026.

In 1918 this had jumped to 75,286.

In 1919 a further increase brought the figures to 287,266.

During the fiscal year 1919 this office in addition distributed 161,316,724 documents of varying nature.

These figures do not include returns, rosters, enlistment papers, service records, identification records, duplicate allotment forms, periodical reports, and numerous other records, these having been received in such vast quantities that it was out of the question to keep account of their number.

RECORDS OF THE SELECTIVE SERVICE RECORD DIVISION.

I. RECORDS.

These consist of all records pertaining to the draft for the World War. They were withdrawn from the custody of the Provost Marshal General, State headquarters, district and local boards, and placed in the custody of The Adjutant General under instructions of the Secretary of War of November 27, 1918.

They comprise the records of:

The Provost Marshal General's office.

51 State and territorial headquarters.

155 district boards.

4,648 local boards.

1,319 medical advisory boards.

3,646 legal advisory boards.

They contain the records of 23,908,576 registrants and many miscellaneous papers; their gross volume was 400,000 cubic feet, and their net volume (after unpacking) about 300,000 cubic feet; they will fill 14 buildings, and, with file cases stacked five high (wherever floor strength permits), and the narrowest aisle space permissible for reasonable access (about 4 feet), they occupy 168,000 square feet of floor space.

II. APPROPRIATIONS.

Congress has made the following appropriation:

For the completion, preservation, and transportation of the records: That not to exceed \$3,500,000 of the unexpended balances on June 30, 1919, of the appropriations "Registration and selection for military service, fiscal year 1919," contained in the Army appropriation act for 1919, approved July 9, 1918, and the deficiency appropriation act for 1919, approved November 4, 1918, are reappropriated and made available for the fiscal year 1920, for all expenses necessary for the completion, preservation, and transportation of the records pertaining to the draft under the act entitled "An act to authorize the President to increase temporarily the Military Establishment of the United States," approved May 18, 1917, including the employment of the necessary clerical and other help for duty in the office of The Adjutant General of the Army in connection with the arrangement, operation, and maintenance of the files of those records. *Provided*, That such part of this appropriation as may be necessary shall be available for the employment of clerical help required to furnish to the adjutants general of the several States statements of service of all persons from those States who entered the military service during the war with Germany.

This seems to be a very moderate appropriation, since it was estimated by the Provost Marshal General that to continue the local boards in operation would cost \$600,000 per month.

THE INSPECTOR GENERAL'S DEPARTMENT.

The annual report of the Inspector General of the Army (an accompanying document to this report) gives a very interesting account of the activities of this department not only for the fiscal year 1919 but also for the two preceding fiscal years.

Reports of inspections made by officers of this department are particularly valuable in that they habitually present an entirely unbiased and independent view of the matter in hand. Their inspections embraced every phase of military activity, such as the organized combat divisions, Coast Artillery, aviation fields, mobilization and other camps, general and base hospitals, remount depots, Transport Service, ports of embarkation, service schools, the military arsenals and depots of all kinds, and the disciplinary barracks, including food and its preparation, instruction and training, discipline, equipment, clothing, supply and administration, records of all kinds, public and semipublic funds, and the efficiency and fitness of officers of all grades.

MEDICAL DEPARTMENT.

The report of the Surgeon General presents in great detail the medical history of the Army during the war, but no report can do justice to the triumph which the medical profession has achieved in its ministry of prevention and cure to our soldiers. The Surgeon General very properly refers to the assistance rendered to the department by the various associated organizations which devoted their

great influence to the welfare and humanitarian interest of the fighting forces. The services of these societies covered every field of our military activity and followed the soldiers from their homes to the front line trench and back to their homes; sometimes by the more or less uneventful route which led merely to the training camp and back, but more often the societies were called upon to follow the soldier through the training camp, across the sea into battle, and to bring him home through casualty dressing stations, evacuation hospitals, base hospitals and convalescent camps, and to adapt their services to his needs as he sought not only to recover shattered health, but to learn a new vocation or cultivate a new skill upon which to rely as a means of livelihood and in substitution of a craft once chosen but now made impossible by injuries received at the front. Of the work of these agencies I desire to speak in another place.

Upon the medical profession proper, of course, extreme demands were made. The Medical Corps increased from 833 officers to 30,591. Before the war the full strength of the Medical Department, including commissioned officers, contract surgeons, Army nurses, and civilian employees, numbered about 8,634. The maximum reached by this personnel, however, during the war was 372,505, so that the Medical Department alone comprised a strength practically three times as great as the entire standing Army a few years before the beginning of the war. The force of trained nurses was increased from 403 to 21,480. These figures are impressive enough as a mere study of expansion, but in a technical service like the Medical Department they present problems of organization, supervision, and control which are quite unknown under any other circumstances.

The medical profession of the country grouped itself around the Surgeon General with devotion and unanimity. Leaders in general medicine, general surgery, and the specialists in both branches of the science left their private practices and great hospital positions to accept any service available with the Army, and they were followed by the younger men in all branches of the profession, so that the chief problem of the Surgeon General was rather not to rob the communities at home of their entire medical reliance than to seek fresh accessions to his own force. Indeed, it was necessary to cooperate very fully with State boards of health, the medical societies, and the Public Health Service in the interest of retaining in America a proper distribution of medical and surgical men to meet the daily needs of the people.

But the Army doctor must needs have much knowledge of a semi-military sort. The practice of his profession among his patients must be made to integrate with the military organization. Supplies are furnished to him by a system with which, in civil life, he is unfamiliar. The vast emergency hospitals in which he is called to

serve, accommodating frequently several thousand patients, must be organized and systematized, and each doctor's duty must be a part of that system and fit into that organization, if there is to be order and the best chance for the sick.

The emergency medical officers who came from civil life had all this to learn, and they had to learn to move with a moving army, and to improvise facilities in bomb-proofs and on the battlefield itself where they were in contact with the moving and fighting military organization and where the first duty was the success of the military movement. Here the changing fortunes of battle might interrupt vital operations and call upon the medical officer to shepherd his injured patients by the quick command of transport to a safer place behind the lines.

The task of the Surgeon General's Department, therefore, was delicate and difficult beyond the mere expansion of numbers indicated by the figures before quoted.

The hospital facilities in this country were expanded from the needs of an army of less than 100,000 to the needs of one of nearly 2,000,000 men, and ample as the original provision seemed to be the influenza epidemic overcrowded the hospitals and called for the provision of emergency facilities. In the American Expeditionary Forces hospitals were taken over from the French and emergency hospitals built until an aggregate bed capacity of 300,000 was provided, making in hospitals, convalescent camps, and the evacuation hospitals in the zone of the armies provision for 15 out of every 100 men in the American Army in France. In hospital centers, as they were called in France, numbers of base hospitals were grouped together, some centers having a capacity of more than 25,000 patients.

The facilities provided by the Medical Department were of the most modern and approved kind, and the restorative procedures developed and applied were amazing in their daring as well as in the results accomplished. Restoration to usefulness of arms and legs by bone-grafting processes has saved thousands of soldiers from amputations, and given them practically complete use of limbs shattered, and in part shot away. The work done in facial restoration is especially striking. From photographs of soldiers whose faces had been utterly disfigured, sculptors constructed plaster models of the soldier's appearance before his injury. The surgeons then robbed his ribs of cartilage and bone, and various portions of his body of tissue, and reconstructed the marred face until shocking disfigurement gave place to a restored countenance with here and there a delicate scar line which concealed the processes, but revealed the skill of the surgeon who had wrought the miracle.

But the doctor's task shown in its highest expression of skill and daring in these procedures was required also in the elimination of

the physically unfit at the point of entrance into the Army. The development of those having slight defects in order to conserve the man power available for military use, and the vast and beneficent processes of preventive medicine of which the results only appear in statistical tables, can be seen only by those who realize what might have been had sanitary science not safeguarded the soldier from "the pestilence that walketh in darkness."

The work of caring for the sick and wounded was, as the Surgeon General remarks, a tremendous undertaking. During the year covered by his report the total number of sick officers and enlisted men who required hospital treatment or treatment in quarters was 2,833,204, and this number does not include soldiers treated for minor ailments, nor does it include civilians of various kinds attached to the medical personnel and receiving the attention of medical officers. Of this great number 2,422,363 cases resulted from disease, 182,789 from ordinary injuries, and 228,053 from battle injuries. Great as this number is, it is interesting to note that if the same admission rates had prevailed during 1917-18 as during the first two years of the Civil War there would have been 9,759,847 admissions from disease alone, and had the same rate obtained as during the Spanish War and the Philippine Insurrection in 1898-99, the disease admissions would have been 6,385,683. The Surgeon General justly remarks: "It may then be said that preventive medicine resulted in the saving of 6,869,571 cases of sickness as compared with the Civil War, and 3,495,407 as compared with the Spanish-American War." There has been no other equally spectacular demonstration either of the advance of medicine as a science or the incalculable benefit to mankind of preventive medicine. With this result before us, the public will appreciate the possibilities of the Public Health Service, and of the work done by State and municipal boards of health in a way which no other lesson could have taught.

The influenza epidemic, or pandemic, as it is significantly called by medical men, swept through the world with unprecedented swiftness and fatality. It was not a camp-born or camp-bred disorder, but attacked soldiers and civilians alike, and presented at once the most baffling and the most menacing disease problem of the war. Although the epidemic was of relatively brief duration, it caused 31.82 per cent of the total cases of sickness in the Army among officers and 28.26 per cent of the total cases of sickness among enlisted men.

It is difficult to say with certainty what proportion of the deaths from disease were due to influenza as it ran off into complications of pneumonia, the latter being the immediate cause of death. Pneumonia also occurred, however, as a consequence of measles and other contagious diseases, and, of course, frequently followed traumatism.

Had this great pandemic not occurred, the disease rate and the death rate from disease in the Army would have continued as it was throughout most of the war period—far lower than the normal disease and death rate in the United States, or even in the great cities of the United States best provided with sanitation and medical supervision. The following table indicates how the enforcement of sanitary measures during this war has reduced the number of deaths as compared with those during the Civil War and the Spanish-American War. It also shows conclusively that deaths from the so-called “camp diseases” (typhoid fever, malaria, and dysentery) have practically been eliminated:

	Number of deaths that occurred in present war, Sept. 1, 1917–May 2, 1919. Average strength, approximately 2,121,396.	Number of deaths that would have occurred if the Civil War death rate had obtained.	Number of deaths that would have occurred if the Spanish-American War death rate had obtained.
Typhoid fever.....	213	51,133	68,164
Malaria.....	13	¹ 13,951	11,317
Dysentery.....	² 42	² 63,898	² 6,382
Smallpox.....	5	9,536	37
Pneumonia.....	³ 41,747	³ 38,962	³ 6,086
Scarlet fever.....	167	112	222
Diphtheria.....	100	1,183	149
Tuberculosis.....	1,220	9,574	⁴ 631
Meningitis.....	2,137	3,859	4,081
Other diseases.....	3,768	34,881	15,587
Total for disease.....	49,412	227,094	112,656

¹ Includes malaria and remittent and congestive fevers.

² Includes dysentery and diarrhea.

³ Includes deaths listed from measles, influenza, empyema, inflammation of the lungs, and pleurisy, as well as pneumonia.

⁴ Rate low due to short period of war, that the war was during summer months, and tuberculosis sufferers were discharged as soon as diagnosed.

At no time in our history have we ever had so comprehensive a survey of the health of the young men of our country. Every man inducted into the service or presented for induction was examined. The examinations, of course, followed the same course in each case. The health record of each inducted man was kept, and upon discharge a final examination was made and its results recorded. These records are, of course, voluminous, (as yet not completely studied) and they contain the basis for conclusions and guides to future action of the highest importance. Already, however, some observations based upon this survey can be safely made.

A partial analysis shows that out of 2,510,000 men between 21 and 30 years of age examined by local boards, 730,000, or 29.1 per cent, were rejected on physical grounds. Often the defect had not previously been known by the individual. Where the defect was by

reason of disease the thoughtful individual without doubt placed himself under the care of a physician, to the consequent improvement in the national health. An extensive survey was made to determine the presence of intestinal parasites. It is of interest to note that of over half a million soldiers who received careful microscopical examinations, about 70,000 showed the presence of one or more intestinal parasites, and of these about 60,000 were infested with hookworms. These men were placed under treatment and ultimately returned to their communities freed from these disabling parasites.

Aside from the great benefit to the health of the Nation by the individual taking home with him and transmitting to his family and fellow citizens the lessons in sanitation and personal hygiene which he had learned during his Army service, the physical improvement in the soldier himself has been remarkable. Increase in girth and chest expansion was particularly noticeable. Sanitary inspectors have remarked on the awkward, narrow-chested, and flabbily muscled men who arrived at mobilization camps and the bronzed, erect, and broad-chested soldiers with fine muscular development and characteristically alert and self-confident air who were discharged on demobilization. It is estimated that the average gain in weight in the first year of military service was from 15 to 20 pounds, and there is no doubt that this increase in weight was almost entirely in muscular tissues.

On return to civil pursuits the added physical vigor of the discharged soldier will stimulate a desire for more active outdoor exercise, which will make for better health of the individual and a consequent higher type of citizenship. The resulting benefits to the American Nation can not be overestimated.

Out of these statistics we should in general derive three kinds of information. First, the geographical and industrial distribution of causes for rejection. Already we have been able to plot upon a map the group of States having the smallest percentages of rejections; generally speaking, they extend north and south through the middle of the country. Similarly, we have been able to show the States in groups having progressively larger percentages of rejections. No hasty generalization should be made on this subject, but careful study will produce fairly reliable results, since the mass of material is so great and so generally fair to all sections of the country. When these studies are made it will be possible to know just how far the congestion of the modern city is prejudicial to the best physical development of growing boys and men, and how far certain trades and occupations, or certain ranges of hours of labor in industry, or certain minimum age limits for entrance into industrial occupations affect the full and healthy development of the bodies of workers.

Second, we shall learn very important things about the prevalence of mental defects. Already very startling relationships have been

disclosed between low-grade mentality and delinquency. The tests for Army admission will endeavor, of course, to exclude the real defective; but we have learned from our Army experience that many boys in ordinary times are a bit queer to their families and neighbors without being suspected of serious mental defects. They grow from childhood through a process which adapts their environment to their peculiarities and tends to make easy for them the social accommodations necessary. They, on the other hand, learn the limits of their own capacity and accept the accommodations indulgently made for them by their neighbors; and thus, beyond being deemed dull or queer, they suffer no noticeable hardship. When they are drafted into the military service, however, they are taken out of the accommodating environment and brought into a new social group which has had no experience with their peculiarities and, at the outset, makes no allowances for them. They, in turn, find the normal expectation of conduct to be less accommodating to their limitations and so find themselves failing to fit in, thus accenting, or rather revealing to full view, the extent of their departure from normal. Many such peculiarities are due to lack of training, or education, or proper nutrition, or easily corrigible physical defects, and the discovery of the condition and its cause leads often to an easy application of remedies which remove a handicap that otherwise might have been regarded and accepted as a permanent limitation.

Third, the study of these statistics will undoubtedly profoundly affect the physical habits of men. It is not possible to see the robustness which ordered and systematic habits of life cause without wishing at once to bring about the benefits of such habits to youth everywhere. We shall undoubtedly be more regular in our hours of work, recreation and sleep, in our meals, both as to their time and nutritive value, and we shall live more in the open, with the result that the next generation of boys will start from a higher physical plane and accept naturally, and as a lesson of experience, the regimen which has been seen to build up and strengthen the bodies of the young men in this great army.

Fortunately, the relations established in this war between the medical services of the Government have been most intimate and helpful. The medical men of the Army and the Navy and the Public Health Service have practically divided among them the entire medical profession of the country, and the new sciences of applied psychology and psychiatry have been brought in by the association of the most eminent specialists with the medical services. This great body of facts, therefore, contains not only the accumulated observations of the older strictly medical and surgical men, but the diagnoses of the psychiatrists and the subtle suggestions as to both cause and remedy of the psychologists and sociologists.

We may be assured, therefore, that the data collected will be studied not only for the answers to the more or less obvious questions suggested above, but for many other contributions to our knowledge of youth and its problems, physical and mental, and this great survey of the man power of the United States will undoubtedly add rich generalizations which can be used in the Army and in civil life to conserve our man power and thus multiply our industrial, physical, and moral strength as a people.

INSULAR AFFAIRS.

The people of the Philippine Islands have continued to make progress in self-government under the new organic act of August 29, 1916. The desire for the complete independence of the Philippine Islands was expressed by the Philippines Independence Commission which visited Washington in April of this year.

Under the new organic act of Porto Rico (approved Mar. 2, 1917), the people of that island have made satisfactory progress in running their own government as American citizens. In October, 1918, the island suffered a disastrous earthquake shock followed by a tidal wave, and a severe epidemic of influenza in November and December, 1918. These unfortunate occurrences were a severe setback in the upward trend of prosperity in Porto Rico, but measures for recovery are being taken.

The manner in which Porto Rico and the Philippines met all the demands made upon them incident to the World War was most gratifying.

A more detailed account of these matters will be found in the Annual Report of the Acting Chief of the Bureau of Insular Affairs.

MILITIA BUREAU.

During the fiscal year, 1919, the Militia Bureau was charged, in addition to its usual duties with the National Guard not in Federal service, with matters pertaining to the United States Guards of the United States Army, and with matters pertaining to strictly State forces or Home Guards, equipped under Special Regulations 37.

The National Guard, recognized as such previous to August 5, 1917, was absorbed into the United States Army during this entire period, and the National Guard was at its lowest ebb during the period covered by this report. A few organizations failed to qualify as National Guard in time to be inducted into Federal service August 5, 1917. The operation of the selective service act, however, interfered so seriously with the retention of the personnel of National Guard organizations, particularly after the draft age was extended to 45, that it was almost an impossible task to retain in the States a

National Guard under the act of June 3, 1916. As soon as the armistice was declared, November 11, 1918, schemes for demobilization were at once put into effect. The Militia Bureau made every effort to encourage the organization of National Guard units between the dates of November 11, 1918, and June 30, 1919. Because of the limited amount of money available for the purchase of equipment, and in order to meet an emergency by securing a great number of small armed forces located throughout the States, the strength for Federal recognition was reduced, but this reduction did not secure organizations of the National Guard as rapidly as expected, the strength on June 30, 1919, being 1,198 officers and 36,012 men. The failure of the appropriation bill to pass the Sixty-fifth Congress further hampered the development of National Guard units.

Efforts were concentrated upon a revision and compilation of National Guard Regulations issued under the act of June 3, 1916, from time to time as problems arose. This work was virtually ready for the printer by June 30, 1919.

The Militia Bureau on May 14, 1919, initiated a movement to establish a school of instruction at the Infantry School at Camp Benning, Ga., for specially selected men; under date of June 11, 1919, an order was issued directing the establishment of this school with an attendance of 150 students.

The United States Guards of the United States Army continued to develop until the date of the armistice, attaining a strength of 48 battalions, 1,194 officers, and 25,068 enlisted men. Shortly after the armistice the control of the United States Guards was by order turned over to the department commanders in whose department the Guards were serving. The demobilization of this force was ordered on November 29, 1918. The records of the United States were kept in this bureau until March 17, 1919, at which time they were turned over to The Adjutant General's Office, where they are at the present time. The force was utilized in 32 States and the District of Columbia and at 338 separate places.

By order of the Secretary of War, on February 14, 1919, this bureau was charged with the supervision of matters pertaining to strictly State forces or home guard, equipped under Special Regulations 37, while the issues of material were actually made by the Ordnance Department. As nearly as can be determined, there were 78,008 rifles issued for use of Home Guards to June 30, 1919. Some States procured equipment by purchases from State funds. No record is available as to the amount of equipment thus procured.

The reports received from individual States concerning State forces give the organizations, but unfortunately not the strength of each. It is estimated that the State forces furnished equipment from Federal funds did not exceed 79,000 men.

THE PANAMA CANAL.

There still remains work to be done to bring the Panama Canal to completion within the original plans. Relatively small amounts of excavation within the prism of the canal itself are necessary, but substantial quantities of earth must be dredged annually in maintenance, and extensive work of construction within the Canal Zone is still to be carried out before it can be felt that the facilities for the maintenance and operation of this great waterway are adequately provided.

The canal, of course, has now been opened and in use for several years, and its formal opening will shortly be observed with ceremonies appropriate to the completion of one of the great engineering undertakings of history. The commerce of the world now rides from ocean to ocean without accident or inconvenience through a strip of country which once baffled the ingenuity of the world's greatest engineers with its apparently unconquerable difficulties and laid waste, by its tropical and insanitary conditions, armies of men who sought to build a canal there.

To be sure the canal was at its original conception a commercial undertaking, the prospective profits of which were too remote for successful private financing. The credit of the Government of the United States removed this cause of failure, but there remains to the credit of the United States a demonstration of superb engineering daring and skill on the one hand and on the other a triumph for the American medical profession which has eradicated the menace of yellow fever, restrained the usual tropical and other diseases within normal proportions, and rendered the zone so sanitary that perhaps nowhere else in the world is life in the Tropics approximately so safe.

Meanwhile in building the canal we have built up a distinct industrial civilization in this strip of American territory. The amount appropriated for the construction of the canal and its immediate adjuncts totals approximately \$380,000,000, of which \$372,000,000 has been expended for construction. The tolls collected during the present fiscal year amount to \$6,149,598.54. Had a juster system of measurement for tolls been in force the receipts would have aggregated \$7,017,125.02. Such a system of measurement has been carefully worked out and presented to the Congress, and the bill introduced to authorize its enforcement has already passed the House of Representatives.

The total number of ships making the transit of the canal during the fiscal year 1919 was 2,025, of which 860 passed from the Atlantic to the Pacific and 1,165 from the Pacific to the Atlantic. Their aggregate net tonnage, according to Panama Canal rules of measurement, was 6,131,575 tons, and the cargo carried by them aggregated 6,877,649 long tons. In addition to this, 186 vessels of the United States Navy passed through the canal during the year.

Commercial traffic through the canal during the year showed a decrease of 4.93 per cent in the number of ships, 7.92 per cent in gross tonnage, and 9.05 per cent in cargo carried as compared with the preceding year. This, however, in view of conditions caused by submarine warfare and the peremptory demands made upon the shipping of the world for the transportation of American troops and supplies to France, is a remarkably good showing, and with the reestablishment of the ocean trade routes of the world the usefulness of the canal can be expected to grow from year to year. This growth will, of course, be accelerated by the more general distribution of knowledge about the canal itself. Shippers everywhere know of the existence of the canal, but there is little comprehension of the extraordinary facilities created there for the supplying and repairing of ships in transit. Shipowners and shipmasters must be assured that supplies of coal, oil, and subsistence can be procured and necessary repairs made before they will be willing to resort to a place so far removed from the sources of supply upon which they have been accustomed to rely along the old trade routes established and built up through centuries of use. The fact is that the great docks and shops in the Canal Zone are able to berth and repair the largest ships now used in ocean traffic, and even during the stress of war it was found possible to maintain adequate stocks of coal, oil, and supplies for the use of public and commercial vessels making the transit of the canal.

The number of employees on the Isthmus on June 30, 1919, was 20,361, of whom 3,290 were on the so-called gold roll, and 17,071 on the silver roll—a somewhat larger number than on June 30 of the preceding year, the increase being due to the repair work on shops and construction undertaken by the Government for the permanent housing of a part of the garrison.

No serious labor controversies have arisen, although the increased cost of living which has affected labor generally has led the representatives of the canal employees to urge increases in those basic rates of pay in the United States upon which the determination of wages in the Canal Zone is based.

Careful observations made throughout the year upon established points indicate that there has been no movement in the hills at which the great slides of the past have occurred. There have been 46 seismic disturbances of a minor character but no damage to the canal or appurtenant works. We may, therefore, regard the physical and commercial future of the canal as fairly assured, and after its formal opening can take up its permanent administration and operation.

It has always been necessary to maintain schools, hospitals, public facilities for recreation, and to carry on as Government enterprises the means of subsistence supply. It is not right to ask men to live in the Tropics, practically on a Government reservation, devoted

to the performance of work of this character, without providing for them and their families compensating advantages to those which are surrendered at home. It would not be possible to secure the necessary manual and mechanical personnel without constant attention to these needs, but it ought to be possible, as the work of construction reaches completion, to bring about a reduction in the number of employees, and institute some rules with regard to length of service in the Canal Zone which will prevent the nervous and physical breakdown which occurs among people from the temperate zones who live too long in the Tropics.

CIVILIAN PERSONNEL.

In connection with the building up of the immense civilian force which was necessary to handle the activities of the war here in Washington and elsewhere throughout the United States I desire to express my appreciation of the untiring and efficient efforts of the Civil Service Commission.

During the entire war the department and the commission have worked in helpful cooperation. The commission through its various representatives scattered throughout the country recruited many thousands of civilian employees, examined into their qualifications, and also into the qualifications of other thousands recruited by various bureaus of the department in cooperation with the commission and otherwise. It is doubtful whether this important work could have been performed satisfactorily by the department without the aid of the commission; certainly not except at great inconvenience and probably vastly greater expense. The results have justified and strengthened the department's confidence in the efficiency of the civil-service system and the principle upon which it is founded, namely, the selection of employees upon merit as ascertained by the application of standard tests of fitness.

FINANCIAL OPERATIONS.

Among the financial problems which confronted the War Department during the war and after the signing of the armistice were (a) the expeditious payment of troops upon demobilization; (b) the prompt payment of the sick and wounded who arrived in the United States from battle fields and hospitals without the usual records; (c) the payment of the bonus of \$60 to discharged soldiers authorized by Congress after more than 1,500,000 soldiers were discharged; (d) the prompt payment of merchants' bills; (e) the consolidation of funds in Europe to prevent an undue accumulation of balances in the hands of numerous disbursing officers; (f) the application of rates of exchange without any undue loss to the Government; (g) the sale of Liberty loan bonds to the soldiers. As these very interesting problems are discussed succinctly in the report submitted to me by the Director of Finance, it is attached hereto in full as Appendix E.

CONCLUSION.

In the foregoing I have necessarily omitted reference to the work of the great bureaus of the department and bodies of men and individuals which have been in themselves spectacular as instances of successful organization and devotion to the national interests. The reports of the chiefs of such bureaus are of course a part of the official literature of the war. In cases such as that of the Ordnance Department a volume would be required adequately to describe the complexity of the task undertaken, the ingenuity of the means used to meet the task, and the success achieved.

The relations of the War Department to the other great executive departments of the Government have been cordial, and the help extended to the War Department by the scientific bureaus either associated with other departments or independently organized has been an indispensable part of the work done.

In transmitting these reports I feel that they are the raw material out of which history will be written and out of which in time will emerge a faithful picture of the unselfishness and devotion with which public officers and private citizens have cooperated to achieve success. The early struggles of the War Department with its inadequate peace-time organization resulted in an effective machine for the training of men and the production of supplies. The success which Gen. Pershing achieved in Europe rested for its foundation upon the work done in America.

Necessarily the Secretary of War has had to rely upon his associates, military and civil, to accomplish in their respective fields their parts of these great undertakings. On the military side I would be wanting were I to fail to refer to the broad imagination, the unremitting energy, the firmness of purpose with which the Chief of Staff, General March, has pressed forward the program. Without his strength and vision much that was done could not have been done either so soon or so well. As it is I can only record the successful conclusion of the Great War, the splendid efficiency of America's participation, and an enlightened treatment of post-war problems which has gone far to restore the industry and commerce of the country and to close up our financial and business relations in an harmonious and satisfactory way.

These great results have been achieved by American soldiers and American citizens under the guidance of their Commander in Chief.

Respectfully,

NEWTON D. BAKER,
Secretary of War.

FINAL REPORT OF GEN. JOHN J. PERSHING.

GENERAL HEADQUARTERS AMERICAN EXPEDITIONARY FORCES,
September 1, 1919.

To the SECRETARY OF WAR.

SIR: I have the honor to submit herewith my final report as Commander-in-Chief of the American Expeditionary Forces in Europe.

PART I.

PERIOD OF ORGANIZATION.

1. I assumed the duties of this office on May 26, 1917, and, accompanied by a small staff, departed for Europe on board the S. S. *Baltic* May 28. We arrived at London on June 9 and, after spending some days in consultation with the British authorities, reached Paris on June 13.

2. Following the rather earnest appeals of the Allies for American troops, it was decided to send to France, at once, 1 complete division and 9 newly organized regiments of Engineers. The division was formed of regular regiments, necessary transfers of officers and men were made, and recruits were assigned to increase these units to the required strength.

The offer by the Navy Department of one regiment of Marines to be reorganized as Infantry was accepted by the Secretary of War, and it became temporarily a part of the First Division.

Prior to our entrance into the war, the regiments of our small army were very much scattered, and we had no organized units, even approximating a division, that could be sent overseas prepared to take the field. To meet the new conditions of warfare an entirely new organization was adopted in which our Infantry divisions were to consist of 4 regiments of Infantry of about treble their original size, 3 regiments of Artillery, 14 machine-gun companies, 1 Engineer regiment, 1 Signal battalion, 1 troop of Cavalry, and other auxiliary units, making a total strength of about 28,000 men.

MILITARY SITUATION.

3. In order that the reasons for many important decisions reached in the early history of the American Expeditionary Forces may be more clearly understood and the true value of the American effort more fully appreciated, it is desirable to have in mind the main events leading up to the time of our entry into the war.

1914.

4. Although the German drive of 1914 had failed in its immediate purpose, yet her armies had made very important gains. German forces were in complete possession of Belgium and occupied rich industrial regions of northern France, embracing one-fourteenth of her population and about three-fourths of her coal and iron. The German armies held a strongly fortified line 468 miles in length, stretching from the Swiss border to Nieuport on the English Channel; her troops were within 48 miles of Paris and the initiative remained in German hands.

In the east the rapidity of the Russian mobilization forced Germany, even before the Battle of the Marne, to send troops to that frontier, but the close of 1914 found the Russian armies ejected from East Prussia and driven back on Warsaw.

The entry of Turkey into the war, because of the moral effect upon the Moslem world and the immediate constant threat created against Allied communications with the Far East, led to an effort by the Allies in the direction of the Dardanelles.

1915.

5. Italy joined the Allies in May and gave their cause new strength, but the effect was more or less offset when Bulgaria entered on the side of the Central Powers.

The threatening situation on the Russian front and in the Balkans was still such that Germany was compelled to exert an immediate offensive effort in those directions and to maintain only a defensive attitude on the western front. German arms achieved a striking series of successes in the vicinity of the Mazurian Lakes and in Galicia, capturing Warsaw, Brest-Litovsk, and Vilna. The Central Powers overran Serbia and Montenegro. Meanwhile, the Italian armies forced Austria to use approximately one-half of her strength against them.

In the west, the French and British launched offensives which cost the German armies considerable loss; but the objectives were limited and the effect was local.

The Dardanelles expedition, having failed in its mission, was withdrawn in January, 1916. In Mesopotamia the Allied operations had

not been successful. Although the British fleet had established its superiority on the sea, yet the German submarine blockade had developed into a serious menace to Allied shipping.

1916.

6. Germany no doubt believed that her advantage on the eastern front at the close of 1915 again warranted an offensive in the west, and her attack against Verdun was accordingly launched in the spring of 1916. But Russia was not yet beaten and early in June, aided at the same time by the threat of an Italian offensive in the west, she began the great drive in Galicia that proved so disastrous to Austria.

Roumania, having entered on the side of the Allies, undertook a promising offensive against Austria. The British and French Armies attacked along the Somme. Germany quickly returned to the defensive in the west, and in September initiated a campaign in the east which, before the close of 1916, proved unfortunate for Russia as well as Roumania.

SPRING OF 1917.

7. Retaining on the eastern front the forces considered sufficient for the final conquest of Russia, Germany prepared to aid Austria in an offensive against Italy. Meanwhile, the Russian revolution was well under way and, by the midsummer of 1917, the final collapse of that government was almost certain.

The relatively low strength of the German forces on the western front led the Allies with much confidence to attempt a decision on this front; but the losses were very heavy and the effort signally failed. The failure caused a serious reaction especially on French morale, both in the army and throughout the country, and attempts to carry out extensive or combined operations were indefinitely suspended.

In the five months ending June 30, German submarines had accomplished the destruction of more than three and one-quarter million tons of Allied shipping. During three years Germany had seen practically all her offensives except Verdun crowned with success. Her battle lines were held on foreign soil and she had withstood every Allied attack since the Marne. The German general staff could now foresee the complete elimination of Russia, the possibility of defeating Italy before the end of the year and, finally, the campaign of 1918 against the French and British on the western front which might terminate the war.

It can not be said that German hopes of final victory were extravagant, either as viewed at that time or as viewed in the light of

history. Financial problems of the Allies were difficult, supplies were becoming exhausted and their armies had suffered tremendous losses. Discouragement existed not only among the civil population but throughout the armies as well. Such was the Allied morale that, although their superiority on the western front during the last half of 1916 and during 1917 amounted to 20 per cent, only local attacks could be undertaken and their effect proved wholly insufficient against the German defense. Allied resources in man power at home were low and there was little prospect of materially increasing their armed strength, even in the face of the probability of having practically the whole military strength of the Central Powers against them in the spring of 1918.

8. This was the state of affairs that existed when we entered the war. While our action gave the Allies much encouragement yet this was temporary, and a review of conditions made it apparent that America must make a supreme material effort as soon as possible. After duly considering the tonnage possibilities I cabled the following to Washington on July 6, 1917:

Plans should contemplate sending over at least 1,000,000 men by next May.

ORGANIZATION PROJECTS.

9. A general organization project, covering as far as possible the personnel of all combat, staff, and administrative units, was forwarded to Washington on July 11. This was prepared by the Operations Section of my staff and adopted in joint conference with the War Department Committee then in France. It embodied my conclusions on the military organization and effort required of America after a careful study of French and British experience. In forwarding this project I stated:

It is evident that a force of about 1,000,000 is the smallest unit which in modern war will be a complete, well-balanced, and independent fighting organization. However, it must be equally clear that the adoption of this size force as a basis of study should not be construed as representing the maximum force which should be sent to or which will be needed in France. It is taken as the force which may be expected to reach France in time for an offensive in 1918, and as a unit and basis of organization. Plans for the future should be based, especially in reference to the manufacture of artillery, aviation, and other material, on three times this force—i. e., at least 3,000,000 men.

The original project for organized combat units and its state of completion on November 11, 1918, are shown in the charts appended to this report. With a few minor changes, this project remained our guide until the end.

10. While this general organization project provided certain Services of Supply troops, which were an integral part of the

larger combat units, it did not include the great body of troops and services required to maintain an army overseas. To disembark 2,000,000 men, move them to their training areas, shelter them, handle and store the quantities of supplies and equipment they required called for an extraordinary and immediate effort in construction. To provide the organization for this purpose, a project for engineer services of the rear, including railways, was cabled to Washington August 5, 1917, followed on September 18, 1917, by a complete service of the rear project, which listed item by item the troops considered necessary for the Services of Supply. Particular attention is invited to the charts herewith, which show the extent to which this project had developed by November 11, 1918, and the varied units required, many of which did not exist in our Army prior to this war.

11. In order that the War Department might have a clear-cut program to follow in the shipment of personnel and material to insure the gradual building up of a force at all times balanced and symmetrical, a comprehensive statement was prepared covering the order in which the troops and services enumerated in these two projects should arrive. This schedule of priority of shipments, forwarded to the War Department on October 7, divided the initial force called for by the two projects into six phases corresponding to combatant corps of six divisions each.

The importance of the three documents, the general organization project, the service of the rear project, and the schedule of priority of shipments should be emphasized, because they formed the basic plan for providing an army in France together with its material for combat, construction, and supply.

AMERICAN FRONT AND LINE OF COMMUNICATIONS.

12. Before developing plans for a line of communications it was necessary to decide upon the probable sector of the front for the eventual employment of a distinctive American force. Our mission was offensive and it was essential to make plans for striking the enemy where a definite military decision could be gained. While the Allied Armies had endeavored to maintain the offensive, the British, in order to guard the Channel ports, were committed to operations in Flanders and the French to the portion of the front protecting Paris. Both lacked troops to operate elsewhere on a large scale.

To the east the great fortified district east of Verdun and around Metz menaced central France, protected the most exposed portion of the German line of communications, that between Metz and Sedan, and covered the Briey iron region, from which the enemy

obtained the greater part of the iron required for munitions and material. The coal fields east of Metz were also covered by these same defenses. A deep advance east of Metz, or the capture of the Briey region, by threatening the invasion of rich German territory in the Moselle Valley and the Saar Basin, thus curtailing her supply of coal or iron, would have a decisive effect in forcing a withdrawal of German troops from northern France. The military and economic situation of the enemy, therefore, indicated Lorraine as the field promising the most fruitful results for the employment of our armies.

13. The complexity of trench life had enormously increased the tonnage of supplies required by troops. Not only was it a question of providing food but enormous quantities of munitions and material were needed. Upon the railroads of France fell the burden of meeting the heavy demands of the three and one-half million Allied combatants then engaged.

The British were crowding the Channel ports and the French were exploiting the manufacturing center of Paris, so that the railroads of northern France were already much overtaxed. Even though the Channel ports might be used to a limited extent for shipments through England, the railroads leading eastward would have to cross British and French zones of operation, thus making the introduction of a line of communications based on ports and railways in that region quite impracticable. If the American Army was to have an independent and flexible system it could not use the lines behind the British-Belgium front nor those in rear of the French front covering Paris.

The problem confronting the American Expeditionary Forces was then to superimpose its rail communications on those of France where there would be the least possible disturbance to the arteries of supply of the two great Allied armies already in the field. This would require the utmost use of those lines of the existing French railroad system that could bear an added burden. Double-track railroad lines from the ports of the Loire and the Gironde Rivers unite at Bourges, running thence via Nevers, Dijon, and Neufchateau, with lines radiating therefrom toward the right wing of the Allied front. It was estimated that these with the collateral lines available, after considerable improvement, could handle an additional 50,000 tons per day, required for an army of 2,000,000 men. The lines selected, therefore, were those leading from the comparatively unused south-Atlantic ports of France to the northeast where it was believed the American Armies could be employed to the best advantage.

14. In the location of our main depots of supply, while it was important that they should be easily accessible, yet they must also be at

a safe distance, as we were to meet an aggressive enemy capable of taking the offensive in any one of several directions. The area embracing Tours, Orleans, Montargis, Nevers, and Chateauroux was chosen, as it was centrally located with regard to all points on the arc of the western front.

The ports of St. Nazaire, La Pallice, and Bassens were designated for permanent use, while Nantes, Bordeaux, and Pauillac were for emergency use. Several smaller ports, such as St. Malo, Sables-d'Olonne, and Bayonne, were available chiefly for the importation of coal from England. From time to time, certain trans-Atlantic ships were sent to Le Havre and Cherbourg. In anticipation of a large increase in the amount of tonnage that might be required later, arrangements were made during the German offensive of 1918 to utilize the ports of Marseilles and Toulon as well as other smaller ports on the Mediterranean.

For all practical purposes the American Expeditionary Forces were based on the American Continent. Three thousand miles of ocean to cross with the growing submarine menace confronting us, the quantity of ship tonnage that would be available then unknown and a line of communications by land 400 miles long from French ports to our probable front presented difficulties that seemed almost insurmountable as compared with those of our Allies.

15. For purposes of local administration our line of communications in France was subdivided into districts or sections. The territory corresponding to and immediately surrounding the principal ports were, respectively, called base sections, with an intermediate section embracing the region of the great storage depots and an advance section extending to the zone of operations, within which the billeting and training areas for our earlier divisions were located.

16. In providing for the storage and distribution of reserve supplies an allowance of 45 days in the base sections was planned, with 30 days in the intermediate section and 15 days in the advance section. After the safety of our sea transport was practically assured, this was reduced to a total of 45 days, distributed proportionately. When the Armistice was signed all projects for construction had been completed and supplies were on hand to meet the needs of 2,000,000 men, while further plans for necessary construction and for the supply of an additional 2,000,000 were well under way.

GENERAL STAFF.

17. The organization of the General Staff and supply services was one of the first matters to engage my attention. Our situation in this regard was wholly unlike that of our Allies. The French Army was at home and in close touch with its civil government and

war department agencies. While the British were organized on an overseas basis, they were within easy reach of their base of supplies in England. Their problems of supply and replacement were simple as compared with ours. Their training could be carried out at home with the experience of the front at hand, while our troops must be sent as ships were provided and their training resumed in France where discontinued in the States. Our available tonnage was inadequate to meet all the initial demands, so that priority of material for combat and construction, as well as for supplies that could not be purchased in Europe, must be established by those whose perspective included all the services and who were familiar with general plans. For the proper direction and coordination of the details of administration, intelligence, operations, supply, and training, a General Staff was an indispensable part of the Army.

The functions of the General Staff at my headquarters were finally allotted to the five sections, each under an Assistant Chief of Staff, as follows: To the First, or Administrative Section—ocean tonnage, priority of overseas shipments, replacement of men and animals, organization and types of equipment for troops, billeting, prisoners of war, military police, leaves and leave areas, welfare work and amusements; to the Second, or Intelligence Section—information regarding the enemy, including espionage and counterespionage, maps, and censorship; to the Third, or Operations Section—strategic studies and plans and employment of combat troops; to the Fourth Section—coordination of supply services, including Construction, Transportation, and Medical Departments, and control of regulating stations for supply; to the Fifth, or Training Section—tactical training, schools, preparation of tactical manuals, and athletics. This same system was applied in the lower echelons of the command down to include divisions, except that in corps and divisions the Fourth Section was merged with the First and the Fifth Section with the Third.

18. As the American Expeditionary Forces grew, it was considered advisable that, in matters of procurement, transportation, and supply, the chiefs of the several supply services, who had hitherto been under the General Staff at my headquarters, should be placed directly under the supervision of the commanding general, Services of Supply. At General Headquarters, a Deputy Chief of Staff to assist the Chief of Staff was provided, and the heads of the five General Staff sections became Assistant Chiefs of Staff.

The General Staff at my headquarters thereafter concerned itself with the broader phase of control. Under my general supervision and pursuant to clearly determined policies, the Assistant Chiefs of Staff, coordinated by the Chief of Staff, issued instructions and

gave general direction to the great combat units and to the Services of Supply, keeping always in close touch with the manner and promptness of their fulfillment. Thus a system of direct responsibility was put into operation which contemplated secrecy in preparation, prompt decision in emergency, and coordinate action in execution.

19. With the growth of our forces the demand for staff officers rapidly increased, but the available number of officers trained for staff duty was very limited. To meet this deficiency, a General Staff college was organized at Langres on November 28, 1917, for the instruction of such officers as could be spared. An intensive course of study of three months was prescribed embracing the details of our staff organization and administration, and our system of supply, and teaching the combined employment of all arms and services in combat. Officers were carefully chosen for their suitability and, considering the short time available, graduates from this school returned well equipped for staff duties and with a loyal spirit of common service much accentuated. The Staff College carried to completion four courses of three months each, graduating 537 staff officers.

TRAINING.

20. Soon after our arrival in Europe careful study was made of the methods followed by our Allies in training combat troops. Both the French and British maintained continuously a great system of schools and training centers, which provided for both theoretical and practical instruction of inexperienced officers and noncommissioned officers. These centers were required not only to train new troops, but to prepare officers and soldiers for advancement by giving them a short course in the duties of their new grades. These school systems made it possible to spread rapidly a knowledge of the latest methods developed by experience and at the same time counteract false notions.

21. A similar scheme was adopted in August, 1917, for our Armies in which the importance of teaching throughout our forces a sound fighting doctrine of our own was emphasized. It provided for troop training in all units up to include divisions. Corps centers of instruction for noncommissioned officers and unit commanders of all arms were established. These centers also provided special training for the instructors needed at corps schools. Base training centers for replacement troops and special classes of soldiers, such as cooks and mechanics, were designated. The army and corps schools were retained under the direct supervision of the Training Section, General Staff. The schools mentioned graduated 21,330 noncommissioned officers and 13,916 officers.

Particular care was taken to search the ranks for the most promising soldiers, in order to develop leaders for the command of platoons and companies. There were graduated from these candidate schools in France 10,976 soldiers. It was planned to have 22,000 infantrymen under instruction by January 1, 1919, graduating 5,000 to 6,000 each month. In addition, there were to be graduated monthly 800 artillerymen, 400 engineers, and 200 signalmen, making a total of about 7,000 soldiers each month. Prior to November 14, 1918, 12,732 soldiers were commissioned as officers.

It must not be thought that such a system is ideal, but it represents a compromise between the demand for efficiency and the imperative and immediate necessity for trained replacement officers.

22. Every advantage was taken of the experience of our Allies in training officers. It was early recommended to the War Department that French and British officers be asked for to assist in the instruction of troops in the United States. Pending the organization and development of our own schools, a large number of our officers were sent to centers of instruction of the Allied armies. The training of our earlier divisions was begun in close association with the French divisions, under conditions set forth in the following paragraph on divisional training:

Trench warfare naturally gives prominence to the defensive as opposed to the offensive. To guard against this, the basis of instruction should be essentially the offensive both in spirit and in practice. The defensive is accepted only to prepare for future offensive.

For training our Artillery units, special localities such as Valdahon, Coetquidan, Meucon, and Souge, had to be sought, and the instruction was usually carried on in conjunction with French artillery followed up later, as far as possible, with field practice in cooperation with our own Infantry.

23. The long period of trench warfare had so impressed itself upon the French and British that they had almost entirely dispensed with training for open warfare. It was to avoid this result in our Army and to encourage the offensive spirit that the following was published in October, 1917:

1. * * * (a) The above methods to be employed must remain or become distinctly our own.

(b) All instruction must contemplate the assumption of a vigorous offensive. This purpose will be emphasized in every phase of training until it becomes a settled habit of thought.

(c) The general principles governing combat remain unchanged in their essence. This war has developed special features which involve special phases of training, but the fundamental ideas enunciated in our Drill Regulations, Small Arms Firing Manual, Field Service Regulations, and other service manuals remain the guide for both officers and soldiers and constitute the standard

by which their efficiency is to be measured, except as modified in detail by instructions from these headquarters.

(d) The rifle and the bayonet are the principal weapons of the infantry soldier. He will be trained to a high degree of skill as a marksman, both on the target range and in field firing. An aggressive spirit must be developed until the soldier feels himself, as a bayonet fighter, invincible in battle.

(e) All officers and soldiers should realize that at no time in our history has discipline been so important; therefore, discipline of the highest order must be exacted at all times. The standards for the American Army will be those of West Point. The rigid attention, upright bearing, attention to detail, uncomplaining obedience to instructions required of the cadet will be required of every officer and soldier of our armies in France. * * *

Recommendations were cabled to Washington emphasizing the importance of target practice and musketry training, and recommending that instruction in open warfare be made the mission of troops in the United States, while the training in trench warfare so far as necessary be conducted in France. Succeeding divisions, whether serving temporarily with the British or French, were trained as thus indicated. The assistance of the French units was limited to demonstrations, and, in the beginning, French instructors taught the use of French arms and assisted in the preparation of elementary trench warfare problems.

Assuming that divisions would arrive with their basic training completed in the United States, one month was allotted for the instruction of small units from battalions down, a second month of experience in quiet sectors by battalions, and a third month for field practice in open warfare tactics by division, including artillery. Unfortunately many divisions did not receive the requisite amount of systematic training before leaving the States and complete preparation of such units for battle was thus often seriously delayed.

24. The system of training profoundly influenced the combat efficiency of our troops by its determined insistence upon an offensive doctrine and upon training in warfare of movement. Instruction which had hitherto been haphazard, varying with the ideas and conceptions of inexperienced commanding officers and indifferent instructors, was brought under a system based on correct principles. Approved and systematic methods were maintained and enforced largely by the continual presence of members of the Training Section with the troops both during the training period and in campaign.

INTELLIGENCE.

25. Before our entry into the war, European experience had shown that military operations can be carried out successfully and without unnecessary loss only in the light of complete and reliable information of the enemy. Warfare with battle lines separated by short distances only, made possible the early acquirement of information,

such as that obtained through airplane photography, observation from balloons and planes, sensitive instruments for detecting gun positions and raids to secure prisoners and documents. All such information, together with that from Allied sources, including military, political, and economical, was collected, classified, and rapidly distributed where needed.

26. From careful studies of the systems and actual participation by our officers in methods in use at various Allied headquarters, an Intelligence Service was evolved in our forces which operated successfully from its first organization in August, 1917.

With us the simpler methods, such as observation from the air and ground and the exploitation of prisoners and documents, have proved more effective than the less direct means. Every unit from the battalion up had an intelligence detachment, but only in divisions and larger organizations did the intelligence agencies embrace all available means and sources, including radio interception stations and sound and flash-ranging detachments.

27. The subjects studied by the Intelligence Section embraced the location of the enemy's front line, his order of battle, the history and fighting value of his divisions, his manpower, his combat activities, circulation and movement, his defensive organizations, supply, construction and material, air service, radio service, strategy and tactics, and what he probably knew of our intentions. The political and economic conditions within the enemies' countries were also of extreme importance.

28. To disseminate conclusions, daily publications were necessary, such as a Secret Summary of Intelligence containing information of the broadest scope, which concerned only General Headquarters; and a Summary of Information, distributed down to include the divisions, giving information affecting the western front. A Press Review and a Summary of Air Intelligence were also published.

Maps showing graphically the disposition and movement of enemy troops in our front were the best means for distributing information to our troops. At the base printing plant and at General Headquarters base maps were prepared while mobile printing plants, mounted on trucks, accompanied corps and army headquarters. Combat troops were thus supplied with excellent maps distributed, just before and during an attack, down to include company and platoon commanders. Between July 1 and November 11, 1918, over 5,000,000 maps were used.

29. The secret service, espionage and counterespionage, was organized in close cooperation with the French and British. To prevent indiscretions in the letters of officers and soldiers, as well as in

articles written for the press, the Censorship Division was created. The Base Censor examined individual letters when the writer so desired, censored all mail written in foreign languages, of which there were over 50 used, and frequently checked up letters of entire organizations.

30. The policy of press censorship adopted aimed to accomplish three broad results:

To prevent the enemy from obtaining important information of our forces.

To give to the people of the United States the maximum information consistent with the limitations imposed by the first object.

To cause to be presented to the American people the facts as they were known at the time.

There were with our forces 36 regularly accredited correspondents, while visiting correspondents reached a total of 411.

SUMMER OF 1917 TO SPRING OF 1918.

31. In order to hinder the enemy's conquest of Russia and, if possible, prevent a German attack on Italy, or in the near east, the Allies sought to maintain the offensive on the western front as far as their diminished strength and morale would permit. On June 7, 1917, the British took Messines, while a succession of operations known as the Third Battle of Ypres began on July 31 and terminated with the capture of the Passchendaele Ridge November 6-10. The British attack at Cambrai is of special interest, since it was here that American troops (Eleventh Engineers) first participated in active fighting.

The French successfully attacked on a limited front near Verdun, capturing Mort Homme on August 20 and advancing their lines to La Forge Brook. In another offensive, begun on October 23, they gained considerable ground on Chemin des Dames Ridge. These French attacks were characterized by most careful preparation to insure success in order to improve the morale of their troops.

32. Notwithstanding these Allied attacks on the western front, the immense gains by the German armies in the east, culminating at Riga on September 3, precipitated the collapse of Russia. The following month, the Austrians with German assistance surprised the Italians and broke through the lines at Caporetto, driving the Italian armies back to the Piave River, inflicting a loss of 300,000 men, 600,000 rifles, 3,000 guns, and enormous stores. This serious crisis compelled the withdrawal of 10 French and British divisions from the western front to Italy. The German situation on all other theaters was so favorable that as early as November they began the movement of divisions toward the western front. If needed, her

divisions could be withdrawn from the Italian front before the French and British dared recall their divisions.

33. At first the Allies could hardly hope for a large American Army. Marshal Joffre during his visit to America had made special request that a combat division be sent at once to Europe as visual evidence of our purpose to participate actively in the war; and also asked for Engineer regiments and other special service units.

The arrival of the First Division and the parade of certain of its elements in Paris on July 4 caused great enthusiasm and for the time being French morale was stimulated. Still Allied apprehension was deep-seated and material assistance was imperative. The following extract is quoted from the cabled summary of an Allied conference held on July 26 with the French and Italian Commanders-in-Chief and the British and French Chiefs of Staff:

General conclusions reached were necessity for adoption of purely defensive attitude on all secondary fronts and withdrawing surplus troops for duty on western front. By thus strengthening western front believed Allies could hold until American forces arrive in numbers sufficient to gain ascendancy.

The conference urged the immediate study of the tonnage situation with a view to accelerating the arrival of American troops. With the approach of winter, depression among the Allies over the Russian collapse and the Italian crisis was intensified by the conviction that the Germans would undertake a decisive offensive in the spring.

A review of the situation showed that with Russia out of the war the Central Powers would be able to release a large number of divisions for service elsewhere, and that during the spring and summer of 1918, without interfering with the status quo at Salonika, they could concentrate on the western front a force much stronger than that of the Allies. In view of this, it was represented to the War Department in December as of the utmost importance that the Allied preparations be expedited.

34. On December 31, 1917, there were 176,665 American troops in France and but one division had appeared on the front. Disappointment at the delay of the American effort soon began to develop. French and British authorities suggested the more rapid entry of our troops into the line and urged the amalgamation of our troops with their own, even insisting upon the curtailment of training to conform to the strict minimum of trench requirements they considered necessary.

My conclusion was that, although the morale of the German people and of the armies was better than it had been for two years, only an untoward combination of circumstances could give the enemy a decisive victory before American support as recommended could be made effective, provided the Allies secured unity of action. How-

ever, a situation might arise which would necessitate the temporary use of all American troops in the units of our Allies for the defensive, but nothing in the situation justified the relinquishment of our firm purpose to form our own Army under our own flag.

While the Germans were practicing for open warfare and concentrating their most aggressive personnel in shock divisions, the training of the Allies was still limited to trench warfare. As our troops were being trained for open warfare, there was every reason why we could not allow them to be scattered among our Allies, even by divisions, much less as replacements, except by pressure of sheer necessity. Any sort of permanent amalgamation would irrevocably commit America's fortunes to the hands of the Allies. Moreover it was obvious that the lack of homogeneity would render these mixed divisions difficult to maneuver and almost certain to break up under stress of defeat, with the consequent mutual recrimination. Again, there was no doubt that the realization by the German people that independent American divisions, corps, or armies were in the field with determined purpose would be a severe blow to German morale and prestige.

It was also certain that an early appearance of the larger American units on the front would be most beneficial to the morale of the Allies themselves. Accordingly, the First Division, on January 19, 1918, took over a sector north of Toul; the Twenty-sixth Division went to the Soissons front early in February; the Forty-second Division entered the line near Luneville, February 21, and the Second Division near Verdun, March 18. Meanwhile, the First Army Corps Headquarters, Maj. Gen. Hunter Liggett, commanding, was organized at Neufchateau on January 20, and the plan to create an independent American sector on the Lorraine front was taking shape.

This was the situation when the great German offensive was launched on March 21, 1918.

PART II.

OPERATIONS.

EXPEDITING SHIPMENT OF TROOPS.

1. The War Department planned as early as July, 1917, to send to France by June 15, 1918, 21 divisions of the then strength of 20,000 men each, together with auxiliary and replacement troops, and those needed for the line of communications, amounting to over 200,000, making a total of some 650,000 men. Beginning with October, 6 divisions were to be sent during that quarter, 7 during the first quarter of 1918, and 8 the second quarter. While these numbers fell short of my recommendation of July 6, 1917, which contemplated at least 1,000,000 men by May, 1918, it should be borne in mind that the main factor in the problem was the amount of shipping to become available for military purposes, in which must be included tonnage required to supply the Allies with steel, coal, and food.

2. On December 2, 1917, an estimate of the situation was cabled to the War Department with the following recommendation:

Paragraph 3. In view of these conditions, it is of the utmost importance to the Allied cause that we move swiftly. The minimum number of troops we should plan to have in France by the end of June is 4 Army corps of 24 divisions in addition to troops for service of the rear. Have impressed the present urgency upon Gen. Bliss and other American members of the conference. Gens. Robertson, Foch, and Bliss agree with me that this is the minimum that should be aimed at. This figure is given as the lowest we should think of and is placed no higher because the limit of available transportation would not seem to warrant it.

Paragraph 4. A study of transportation facilities shows sufficient American tonnage to bring over this number of troops, but to do so there must be a reduction in the tonnage allotted to other than Army needs. It is estimated that the shipping needed will have to be rapidly increased up to 2,000,000 tons by May, in addition to the amount already allotted. The use of shipping for commercial purposes must be curtailed as much as possible. The Allies are very weak and we must come to their relief this year, 1918. The year after may be too late. It is very doubtful if they can hold on until 1919 unless we give them a lot of support this year. It is therefore strongly recommended that a complete readjustment of transportation be made and that the needs of the War Department as set forth above be regarded as immediate. Further details of these requirements will be sent later.

and again on December 20, 1917:

Understood here that a shipping program based on tonnage in sight prepared in War College Division in September contemplated that entire First Corps with its corps troops and some 32,000 auxiliaries were to have been shipped by end of November, and that an additional program for December, January, and February contemplates that the shipment of the Second Corps with its corps troops and other auxiliaries should be practically completed by the end of February. Should such a program be carried out as per schedule and should shipments continue at corresponding rate, it would not succeed in placing even three complete corps, with proper proportion of Army troops and auxiliaries, in France by the end of May. The actual facts are that shipments are not even keeping up to that schedule. It is now the middle of December and the First Corps is still incomplete by over two entire divisions* and many corps troops. It can not be too emphatically declared that we should be prepared to take the field with at least four corps by June 30. In view of past performances with tonnage heretofore available such a project is impossible of fulfillment, but only by most strenuous attempts to attain such a result will we be in a position to take a proper part in operations in 1918. In view of fact that as the number of our troops here increases a correspondingly greater amount of tonnage must be provided for their supply, and also in view of the slow rate of shipment with tonnage now available, it is of the most urgent importance that more tonnage should be obtained at once as already recommended in my cables and by Gen. Bliss.

3. During January, 1918, discussions were held with the British authorities that resulted in an agreement, which became known as the six-division plan and which provided for the transportation of six entire divisions in British tonnage, without interference with our own shipping program. High commanders, staff, Infantry, and auxiliary troops were to be given experience with British divisions, beginning with battalions, the Artillery to be trained under American direction, using French matériel. It was agreed that when sufficiently trained these battalions were to be re-formed into regiments and that when the Artillery was fully trained all of the units comprising each division were to be united for service under their own officers. It was planned that the period of training with the British should cover about 10 weeks. To supervise the administration and training of these divisions the Second Corps staff was organized February 20, 1918.

In the latter part of January joint note No. 12, presented by the Military Representatives with the Supreme War Council, was approved by the Council. This note concluded that France would be safe during 1918 only under certain conditions, namely:

(a) That the strength of the British and French troops in France are continuously kept up to their present total strength and that they receive the expected reinforcements of not less than two American divisions per month.

* The First, Forty-second, Second, and Twenty-sixth Divisions had arrived; but not the Replacement and the Depot Divisions.

THE GERMAN OFFENSIVES OF 1918 AND RELATED ALLIED AGREEMENTS.

4. The first German offensive of 1918, beginning March 21, overran all resistance during the initial period of the attack. Within eight days the enemy had completely crossed the old Somme battlefield and had swept everything before him to a depth of some 56 kilometers. For a few days the loss of the railroad center of Amiens appeared imminent. The offensive made such inroads upon French and British reserves that defeat stared them in the face unless the new American troops should prove more immediately available than even the most optimistic had dared to hope. On March 27 the Military Representatives with the Supreme War Council prepared their joint note No. 18. This note repeated the previously quoted statement from joint note No. 12, and continued:

The battle which is developing at the present moment in France, and which can extend to the other theaters of operations, may very quickly place the Allied Armies in a serious situation from the point of view of effectives, and the Military Representatives are from this moment of opinion that the above-detailed condition (see (a) par. 3) can no longer be maintained, and they consider as a general proposition that the new situation requires new decisions.

The Military Representatives are of opinion that it is highly desirable that the American Government should assist the Allied Armies as soon as possible by permitting in principle the temporary service of American units in Allied Army corps and divisions. Such reinforcements must, however, be obtained from other units than those American divisions which are now operating with the French, and the units so temporarily employed must eventually be returned to the American Army.

The Military Representatives are of the opinion that from the present time, in execution of the foregoing, and until otherwise directed by the Supreme War Council, only American infantry and machine-gun units, organized as that Government may decide, be brought to France, and that all agreements or conventions hitherto made in conflict with this decision be modified accordingly.

The Secretary of War, who was in France at this time, Gen. Bliss, the American Military Representative with the Supreme War Council, and I at once conferred on the terms of this note, with the result that the Secretary recommended to the President that joint note No. 18 be approved in the following sense:

The purpose of the American Government is to render the fullest cooperation and aid, and therefore the recommendation of the Military Representatives with regard to the preferential transportation of American infantry and machine-gun units in the present emergency is approved. Such units, when transported, will be under the direction of the Commander-in-Chief of the American Expeditionary Forces, and will be assigned for training and use by him in his discretion. He will use these and all other military forces of the United States under his command in such manner as to render the greatest military assistance, keeping in mind always the determination of this Government to have its various military forces collected, as speedily as their training and the military

situation permits, into an independent American Army, acting in concert with the armies of Great Britain and France, and all arrangements made by him for their temporary training and service will be made with that end in view.

While note No. 18 was general in its terms, the priority of shipments of infantry more especially pertained to those divisions that were to be trained in the British area, as that Government was to provide the additional shipping according to the six-division plan agreed upon even before the beginning of the March 21 offensive.

On April 2 the War Department cabled that preferential transportation would be given to American infantry and machine-gun units during the existing emergency. Preliminary arrangements were made for training and early employment with the French of such infantry units as might be sent over by our own transportation. As for the British agreement, the six-division plan was to be modified to give priority to the infantry of those divisions. However, all the Allies were now urging the indefinite continuation of priority for the shipment of infantry and its complete incorporation in their units, which fact was cabled to the War Department on April 3, with the specific recommendation that the total immediate priority of infantry be limited to four divisions, plus 45,500 replacements, and that the necessity for future priority be determined later.

5. The Secretary of War and I held a conference with British authorities on April 7, during which it developed that the British had erroneously assumed that the preferential shipment of infantry was to be continuous. It was agreed at this meeting that 60,000 infantry and machine-gun troops, with certain auxiliary units to be brought over by British tonnage during April, should go to the British area as part of the six-division plan, but that there should be a further agreement as to subsequent troops to be brought over by the British. Consequently, a readjustment of the priority schedule was undertaken on the basis of postponing "shipment of all noncombatant troops to the utmost possible to meet present situation, and at the same time not make it impossible to build up our own Army."

6. The battle line in the vicinity of Amiens had hardly stabilized when, on April 9, the Germans made another successful attack against the British lines on a front of some 40 kilometers in the vicinity of Armentieres and along the Lys River. As a result of its being included in a salient formed by the German advance, Passchendaele Ridge, the capture of which had cost so dearly in 1917, was evacuated by the British on April 17.

The losses had been heavy and the British were unable to replace them entirely. They were, therefore, making extraordinary efforts to increase the shipping available for our troops. On April 21, I went to London to clear up certain questions concerning the rate of

shipment and to reach the further agreement provided for in the April 7 conference. The result of this London agreement was cabled to Washington April 24, as follows:

(a) That only the infantry, machine guns, engineers, and signal troops of American divisions and the headquarters of divisions and brigades be sent over in British and American shipping during May for training and service with the British army in France up to six divisions and that any shipping in excess of that required for these troops be utilized to transport troops necessary to make these divisions complete. The training and service of these troops will be carried out in accordance with plans already agreed upon between Sir Douglas Haig and Gen. Pershing, with a view at an early date of building up American divisions.

(b) That the American personnel of the artillery of these divisions and such corps troops as may be required to build up American corps organizations follow immediately thereafter, and that American artillery personnel be trained with French matériel and join its proper divisions as soon as thoroughly trained.

(c) If, when the program outlined in paragraphs (a) and (b) is completed, the military situation makes advisable the further shipment of infantry, etc., of American divisions, then all the British and American shipping available for transport of troops shall be used for that purpose under such arrangement as will insure immediate aid to the Allies, and at the same time provide at the earliest moment for bringing over American artillery and other necessary units to complete the organization of American divisions and corps. Provided that the combatant troops mentioned in (a) and (b) be followed by such Service of the Rear and other troops as may be considered necessary by the American Commander-in-Chief.

(d) That it is contemplated American divisions and corps when trained and organized shall be utilized under the American Commander-in-Chief in an American group.

(e) That the American Commander-in-Chief shall allot American troops to the French or British for training or train them with American units at his discretion, with the understanding that troops already transported by British shipping or included in the six divisions mentioned in paragraph (a) are to be trained with the British Army, details as to rations, equipment, and transport to be determined by special agreement.

7. At a meeting of the Supreme War Council held at Abbeville May 1 and 2, the entire question of the amalgamation of Americans with the French and British was reopened. An urgent appeal came from both French and Italian representatives for American replacements or units to serve with their armies. After prolonged discussion regarding this question and that of priority generally the following agreement was reached, committing the Council to an independent American Army and providing for the immediate shipment of certain troops:

It is the opinion of the Supreme War Council that, in order to carry the war to a successful conclusion, an American Army should be formed as early as possible under its own commander and under its own flag. In order to meet the present emergency it is agreed that American troops should be brought to France as rapidly as Allied transportation facilities will permit, and that, as far as consistent with the necessity of building up an American Army, prefer-

ence will be given to infantry and machine-gun units for training and service with French and British Armies; with the understanding that such infantry and machine-gun units are to be withdrawn and united with its own artillery and auxiliary troops into divisions and corps at the direction of the American Commander-in-Chief after consultation with the Commander-in-Chief of the Allied Armies in France.

Subparagraph A. It is also agreed that during the month of May preference should be given to the transportation of infantry and machine-gun units of six divisions, and that any excess tonnage shall be devoted to bringing over such other troops as may be determined by the American Commander-in-Chief.

Subparagraph B. It is further agreed that this program shall be continued during the month of June upon condition that the British Government shall furnish transportation for a minimum of 130,000 men in May and 150,000 men in June, with the understanding that the first six divisions of infantry shall go to the British for training and service, and that troops sent over in June shall be allocated for training and service as the American Commander-in-Chief may determine.

Subparagraph C. It is also further agreed that if the British Government shall transport an excess of 150,000 men in June that such excess shall be infantry and machine-gun units, and that early in June there shall be a new review of the situation to determine further action.

The gravity of the situation had brought the Allies to a full realization of the necessity of providing all possible tonnage for the transportation of American troops. Although their views were accepted to the extent of giving a considerable priority to infantry and machine gunners, the priority agreed upon as to this class of troops was not as extensive as some of them deemed necessary, and the Abbeville conference was adjourned with the understanding that the question of further priority would be discussed at a conference to be held about the end of May.

8. The next offensive of the enemy was made between the Oise and Berry-au-Bac against the French instead of against the British, as was generally expected, and it came as a complete surprise. The initial Aisne attack, covering a front of 35 kilometers, met with remarkable success, as the German armies advanced no less than 50 kilometers in four days. On reaching the Marne that river was used as a defensive flank and the German advance was directed toward Paris. During the first days of June something akin to a panic seized the city and it was estimated that 1,000,000 people left during the spring of 1918.

The further conference which had been agreed upon at Abbeville was held at Versailles on June 1 and 2. The opinion of our Allies as to the existing situation and the urgency of their insistence upon further priority for infantry and machine gunners are shown by the following message prepared by the Prime Ministers of Great Britain, France, and Italy, and agreed to by Gen. Foch:

The Prime Ministers of France, Italy, and Great Britain, now meeting at Versailles, desire to send the following message to the President of the United States:

"We desire to express our warmest thanks to President Wilson for the remarkable promptness with which American aid, in excess of what at one time seemed practicable, has been rendered to the Allies during the past month to meet a great emergency. The crisis, however, still continues. Gen. Foch has presented to us a statement of the utmost gravity, which points out that the numerical superiority of the enemy in France, where 162 Allied divisions now oppose 200 German divisions, is very heavy, and that, as there is no possibility of the British and French increasing the number of their divisions (on the contrary, they are put to extreme straits to keep them up) there is a great danger of the war being lost unless the numerical inferiority of the Allies can be remedied as rapidly as possible by the advent of American troops. He, therefore, urges with the utmost insistence that the maximum possible number of infantry and machine gunners, in which respect the shortage of men on the side of the Allies is most marked, should continue to be shipped from America in the months of June and July to avert the immediate danger of an Allied defeat in the present campaign owing to the Allied reserves being exhausted before those of the enemy. In addition to this, and looking to the future, he represents that it is impossible to foresee ultimate victory in the war unless America is able to provide such an Army as will enable the Allies ultimately to establish numerical superiority. He places the total American force required for this at no less than 100 divisions, and urges the continuous raising of fresh American levies, which, in his opinion, should not be less than 300,000 a month, with a view to establishing a total American force of 100 divisions at as early a date as this can possibly be done.

"We are satisfied that Gen. Foch, who is conducting the present campaign with consummate ability, and on whose military judgment we continue to place the most absolute reliance, is not overestimating the needs of the case, and we feel confident that the Government of the United States will do everything that can be done, both to meet the needs of the immediate situation and to proceed with the continuous raising of fresh levies, calculated to provide, as soon as possible, the numerical superiority which the Commander-in-Chief of the Allied Armies regards as essential to ultimate victory."

A separate telegram contains the arrangements which Gen. Foch, Gen. Pershing, and Lord Milner have agreed to recommend to the United States Government with regard to the dispatch of American troops for the months of June and July.

(Signed)

CLEMENCEAU,
D. LLOYD GEORGE,
ORLANDO.

Such extensive priority had already been given to the transport of American infantry and machine gunners that the troops of those categories which had received even partial training in the United States were practically exhausted. Moreover, the strain on our Services of Supply made it essential that early relief be afforded by increasing its personnel. At the same time, the corresponding services of our Allies had in certain departments been equally overtaxed and their responsible heads were urgent in their representations that their needs must be relieved by bringing over American specialists. The final agreement was cabled to the War Department on June 5, as follows:

The following agreement has been concluded between Gen. Foch, Lord Milner, and myself with reference to the transportation of American troops in the months of June and July:

"The following recommendations are made on the assumption that at least 250,000 men can be transported in each of the months of June and July by the employment of combined British and American tonnage. We recommend:

"(a) For the month of June: (1) Absolute priority shall be given to the transportation of 170,000 combatant troops (viz, six divisions without artillery, ammunition trains, or supply trains, amounting to 126,000 men and 44,000 replacements for combat troops); (2) 25,400 men for the service of the railways, of which 13,400 have been asked for by the French Minister of Transportation, (3) the balance to be troops of categories to be determined by the Commander-in-Chief, American Expeditionary Forces.

"(b) For the month of July: (1) Absolute priority for the shipment of 140,000 combatant troops of the nature defined above (four divisions minus artillery "et cetera" amounting to 84,000 men, plus 56,000 replacement); (2) the balance of the 250,000 to consist of troops to be designated by the Commander-in-Chief, American Expeditionary Forces.

"(c) It is agreed that if the available tonnage in either month allows of the transportation of a larger number of men than 250,000, the excess tonnage will be employed in the transportation of combat troops as defined above.

"(d) We recognize that the combatant troops to be dispatched in July may have to include troops which have had insufficient training, but we consider the present emergency is such as to justify a temporary and exceptional departure by the United States from sound principles of training, especially as a similar course is being followed by France and Great Britain.

(Signed)

"FOCH.

"MILNER.

"PERSHING."

9. The various proposals during these conferences regarding priority of shipment, often very insistent, raised questions that were not only most difficult but most delicate. On the one hand, there was a critical situation which must be met by immediate action, while, on the other hand, any priority accorded a particular arm necessarily postponed the formation of a distinctive American fighting force and the means to supply it. Such a force was, in my opinion, absolutely necessary to win the war. A few of the Allied representatives became convinced that the American Services of Supply should not be neglected but should be developed in the common interest. The success of our divisions during May and June demonstrated fully that it was not necessary to draft Americans under foreign flags in order to utilize American manhood most effectively.

ALLIED COMMANDER-IN-CHIEF.

10. When, on March 21, 1918, the German Army on the western front began its series of offensives, it was by far the most formidable force the world had ever seen. In fighting men and guns it had a great superiority, but this was of less importance than the advantage in morale, in experience, in training for mobile warfare, and in

unity of command. Ever since the collapse of the Russian armies and the crisis on the Italian front in the fall of 1917, German armies were being assembled and trained for the great campaign which was to end the war before America's effort could be brought to bear. Germany's best troops, her most successful generals, and all the experience gained in three years of war were mobilized for the supreme effort.

The first blow fell on the right of the British Armies, including the junction of the British and French forces. Only the prompt cooperation of the French and British general headquarters stemmed the tide. The reason for this objective was obvious and strikingly illustrated the necessity for having some one with sufficient authority over all the Allied Armies to meet such an emergency. The lack of complete cooperation among the Allies on the western front had been appreciated and the question of preparation to meet a crisis had already received attention by the Supreme War Council. A plan had been adopted by which each of the Allies would furnish a certain number of divisions for a general reserve to be under the direction of the military representatives of the Supreme War Council of which Gen. Foch was then the senior member. But when the time came to meet the German offensive in March these reserves were not found available and the plan failed.

This situation resulted in a conference for the immediate consideration of the question of having an Allied Commander-in-Chief. After much discussion during which my view favoring such action was clearly stated, an agreement was reached and Gen. Foch was selected. His appointment as such was made April 3 and was approved for the United States by the President on April 16. The terms of the agreement under which Gen. Foch exercised his authority were as follows:

BEAUVAIS, *April 3, 1918.*

Gen. Foch is charged by the British, French, and American Governments with the coordination of the action of the Allied Armies on the western front; to this end there is conferred on him all the powers necessary for its effective realization. To the same end, the British, French, and American Governments confide in Gen. Foch the strategic direction of military operations.

The Commander-in-Chief of the British, French, and American Armies will exercise to the fullest extent the tactical direction of their armies. Each Commander-in-Chief will have the right to appeal to his Government, if in his opinion his Army is placed in danger by the instructions received from Gen. Foch.

JOHN J. PERSHING, *General, U. S. A.*

EMPLOYMENT OF AMERICAN DIVISIONS FROM MARCH TO SEPTEMBER, 1918.

11. The grave crisis precipitated by the first German offensive caused me to make a hurried visit to Gen. Foch's headquarters, at Bombon, during which all our combatant forces were placed at his disposal. The acceptance of this offer meant the dispersion of our troops along the Allied front and a consequent delay in building up a distinctive American force in Lorraine, but the serious situation of the Allies demanded this divergence from our plans.

On March 21, approximately 300,000 American troops had reached France. Four combat divisions, equivalent in strength to eight French or British divisions, were available—the First and Second then in line, and the Twenty-sixth and Forty-second just withdrawn from line after one month's trench warfare training. The last two divisions at once began taking over quiet sectors to release divisions for the battle; the Twenty-sixth relieved the First Division, which was sent to northwest of Paris in reserve; the Forty-second relieved two French divisions from quiet sectors. In addition to these troops, one regiment of the Ninety-third Division was with the French in the Argonne, the Forty-first Depot Division was in the Services of Supply, and three divisions (Third, Thirty-second, and Fifth) were arriving.

12. On April 25 the First Division relieved two French divisions on the front near Montdidier and on May 28 captured the important observation stations on the heights of Cantigny with splendid dash. French artillery, aviation, tanks, and flame throwers aided in the attack, but most of this French assistance was withdrawn before the completion of the operation in order to meet the enemy's new offensive launched May 27 toward Chateau-Thierry. The enemy reaction against our troops at Cantigny was extremely violent, and apparently he was determined at all costs to counteract the most excellent effect the American success had produced. For three days his guns of all calibers were concentrated on our new position and counterattack succeeded counterattack. The desperate efforts of the Germans gave the fighting at Cantigny a seeming tactical importance entirely out of proportion to the numbers involved.

13. Of the three divisions arriving in France when the first German offensive began, the Thirty-second, intended for replacements, had been temporarily employed in the Services of Supply to meet a shortage of personnel, but the critical situation caused it to be re-assembled and by May 21 it was entering the line in the Vosges. At this time the Fifth Division, though still incomplete, was also ordered into the line in the same region. The Third Division was

assembling in its training area and the Third Corps staff had just been organized to administer these three divisions. In addition to the eight divisions already mentioned, the Twenty-eighth and Seventy-seventh had arrived in the British area, and the Fourth, Twenty-seventh, Thirtieth, Thirty-third, Thirty-fifth, and Eighty-second were arriving there. Following the agreements as to British shipping, our troops came so rapidly that by the end of May we had a force of 600,000 in France.

The third German offensive on May 27, against the French on the Aisne, soon developed a desperate situation for the Allies. The Second Division, then in reserve northwest of Paris and preparing to relieve the First Division, was hastily diverted to the vicinity of Meaux on May 31, and, early on the morning of June 1, was deployed across the Chateau-Thierry-Paris road near Montreuil-aux-Lions in a gap in the French line, where it stopped the German advance on Paris. At the same time the partially trained Third Division was placed at French disposal to hold the crossings of the Marne, and its motorized machine-gun battalion succeeded in reaching Chateau-Thierry in time to assist in successfully defending that river crossing.

The enemy having been halted, the Second Division commenced a series of vigorous attacks on June 4, which resulted in the capture of Belleau Woods after very severe fighting. The village of Bouresches was taken soon after, and on July 1 Vaux was captured. In these operations the Second Division met with most desperate resistance by Germany's best troops.

14. To meet the March offensive, the French had extended their front from the Oise to Amiens, about 60 kilometers, and during the German drive along the Lys had also sent reinforcements to assist the British. The French lines had been further lengthened about 45 kilometers as a result of the Marne pocket made by the Aisne offensive. This increased frontage and the heavy fighting had reduced French reserves to an extremely low point.

Our Second Corps, under Maj. Gen. George W. Read, had been organized for the command of the 10 divisions with the British, which were held back in training areas or assigned to second-line defenses. After consultation with Field Marshal Haig on June 3, 5 American divisions were relieved from the British area to support the French. The Seventy-seventh and Eighty-second Divisions were moved south to release the Forty-second and Twenty-sixth for employment on a more active portion of the front; the Thirty-fifth Division entered the line in the Vosges, and the Fourth and Twenty-eighth Divisions were moved to the region of Meaux and Chateau-Thierry as reserves.

On June 9 the Germans attacked the Montdidier-Noyon front in an effort to widen the Marne pocket and bring their lines nearer to Paris, but were stubbornly held by the French with comparatively little loss of ground. In view of the unexpected results of the three preceding attacks by the enemy, this successful defense proved beneficial to the Allied morale, particularly as it was believed that the German losses were unusually heavy.

15. On July 15, the date of the last German offensive, the First, Second, Third, and Twenty-sixth Divisions were on the Chateau-Thierry front with the Fourth and Twenty-eighth in support, some small units of the last two divisions gaining front-line experience with our troops or with the French; the Forty-second Division was in support of the French east of Rheims; and four colored regiments were with the French in the Argonne. On the Alsace-Lorraine front we had five divisions in line with the French. Five were with the British Army, three having elements in the line. In our training areas four divisions were assembled and four were in the process of arrival.

The Marne salient was inherently weak and offered an opportunity for a counteroffensive that was obvious. If successful, such an operation would afford immediate relief to the Allied defense, would remove the threat against Paris, and free the Paris-Nancy Railroad. But, more important than all else, it would restore the morale of the Allies and remove the profound depression and fear then existing. Up to this time our units had been put in here and there at critical points as emergency troops to stop the terrific German advance. In every trial, whether on the defensive or offensive, they had proved themselves equal to any troops in Europe. As early as June 23 and again on July 10 at Bombon, I had very strongly urged that our best divisions be concentrated under American command, if possible, for use as a striking force against the Marne salient. Although the prevailing view among the Allies was that American units were suitable only for the defensive, and that at all events they could be used to better advantage under Allied command, the suggestion was accepted in principle, and my estimate of their offensive fighting qualities was soon put to the test.

The enemy had encouraged his soldiers to believe that the July 15 attack would conclude the war with a German peace. Although he made elaborate plans for the operation, he failed to conceal fully his intentions, and the front of attack was suspected at least one week ahead. On the Champagne front the actual hour for the assault was known and the enemy was checked with heavy losses. The Forty-second Division entered the line near Somme Py immediately, and five of its infantry battalions and all its artillery became engaged. Southwest of Rheims and along the Marne to the east of Chateau-

Thierry the Germans were at first somewhat successful, a penetration of 8 kilometers beyond the river being effected against the French immediately to the right of our Third Division. The following quotation from the report of the commanding general Third Division gives the result of the fighting on his front:

Although the rush of the German troops overwhelmed some of the front-line positions, causing the infantry and machine-gun companies to suffer, in some cases a 50 per cent loss, no German soldier crossed the road from Fossoy to Crezancy, except as a prisoner of war, and by noon of the following day (July 16) there were no Germans in the foreground of the Third Division sector except the dead.

On this occasion a single regiment of the Third Division wrote one of the most brilliant pages in our military annals. It prevented the crossing at certain points on its front, while on either flank the Germans who had gained a footing pressed forward. Our men, firing in three directions, met the German attacks with counterattacks at critical points and succeeded in throwing two German divisions into complete confusion, capturing 600 prisoners.

16. The selection by the Germans of the Champagne sector and the eastern and southern faces of the Marne pocket on which to make their offensive was fortunate for the Allies, as it favored the launching of the counterattack already planned. There were now over 1,200,000 American troops in France, which provided a considerable force of reserves. Every American division with any sort of training was made available for use in a counteroffensive.

Gen. Petain's initial plan for the counterattack involved the entire western face of the Marne salient. The First and Second American Divisions, with the First French Moroccan Division between them, were employed as the spearhead of the main attack, driving directly eastward, through the most sensitive portion of the German lines, to the heights south of Soissons. The advance began on July 18, without the usual brief warning of a preliminary bombardment, and these three divisions at a single bound broke through the enemy's infantry defenses and overran his artillery, cutting or interrupting the German communications leading into the salient.¹ A general withdrawal from the Marne was immediately begun by the enemy, who still fought stubbornly to prevent disaster.

The First Division, throughout 4 days of constant fighting, advanced 11 kilometers, capturing Berzy-le-Sec and the heights above Soissons and taking some 3,500 prisoners and 68 field guns from the 7 German divisions employed against it. It was relieved by a British division. The Second Division advanced 8 kilometers in the first 26 hours, and by the end of the second day

¹ See plate No. 1.

was facing Tigny, having captured 3,000 prisoners and 66 field guns. It was relieved the night of the 19th by a French division. The result of this counteroffensive was of decisive importance. Due to the magnificent dash and power displayed on the field of Soissons by our First and Second Divisions the tide of war was definitely turned in favor of the Allies.

Other American divisions participated in the Marne counteroffensive. A little to the south of the Second Division, the Fourth was in line with the French and was engaged until July 22. The First American Corps, Maj. Gen. Hunter Liggett commanding, with the Twenty-sixth Division and a French division, acted as a pivot of the movement toward Soissons, capturing Torcy on the 18th and reaching the Chateau-Thierry-Soissons road on the 21st. At the same time the Third Division crossed the Marne and took the heights of Mont St. Pere and the villages of Charteves and Jaulgonne.

In the First Corps, the Forty-second Division relieved the Twenty-sixth on July 25 and extended its front, on the 26th relieving the French division. From this time until August 2 it fought its way through the Forest de Fere and across the Ourcq, advancing toward the Vesle until relieved by the Fourth Division on August 3. Early in this period elements of the Twenty-eighth Division participated in the advance.

Farther to the east the Third Division forced the enemy back to Roncheres Wood, where it was relieved on July 30 by the Thirty-second Division from the Vosges front. The Thirty-second, after relieving the Third and some elements of the Twenty-eighth on the line of the Ourcq River, advanced abreast of the Forty-second toward the Vesle. On August 3 it passed under control of our Third Corps, Maj. Gen. Robert L. Bullard commanding, which made its first appearance in battle at this time, while the Fourth Division took up the task of the Forty-second Division and advanced with the Thirty-second to the Vesle River, where, on August 6, the operation for the reduction of the Marne salient terminated.

In the hard fighting from July 18 to August 6 the Germans were not only halted in their advance but were driven back from the Marne to the Vesle and committed wholly to the defensive. The force of American arms had been brought to bear in time to enable the last offensive of the enemy to be crushed.

17. The First and Third Corps now held a continuous front of 11 kilometers along the Vesle. On August 12 the Seventy-seventh Division relieved the Fourth Division on the First Corps front, and the following day the Twenty-eighth relieved the Thirty-second Division in the Third Corps, while from August 6 to August 10 the Sixth

Infantry Brigade of the Third Division held a sector on the river line. The transfer of the First Corps to the Woevre was ordered at this time, and the control of its front was turned over to the Third Corps.

On August 18 Gen. Petain began an offensive between Rheims and the Oise. Our Third Corps participated in this operation, crossing the Vesle on September 4 with the Twenty-eighth and Seventy-seventh Divisions and overcoming stubborn opposition on the plateau south of the Aisne, which was reached by the Seventy-seventh on September 6. The Twenty-eighth was withdrawn from the line on September 7. Two days later the Third Corps was transferred to the region of Verdun, the Seventy-seventh Division remaining in line on the Aisne River until September 17.

The Thirty-second division, upon its relief from the battle on the Vesle, joined a French corps north of Soissons and attacked from August 29 to 31, capturing Juvigny after some particularly desperate fighting and reaching the Chauny-Soissons road.

18. On the British front two regiments of the Thirty-third Division participated in an attack on Hamel July 4, and again on August 9 as an incident of the allied offensive against the Amiens salient. One of these regiments took Gressaire Wood and Chipilly Ridge, capturing 700 prisoners and considerable matériel.

ASSEMBLING THE FIRST AMERICAN ARMY.

19. In conference with Gen. Petain at Chantilly on May 19 it had been agreed that the American Army would soon take complete charge of the sector of the Woevre. The Twenty-sixth Division was already in line in the Woevre north of Toul and was to be followed by other American divisions as they became available, with the understanding that the sector was to pass to our control when four divisions were in the line. But demands of the battle then going on farther west required the presence of our troops, and the agreement had no immediate result. Due to the presence of a number of our divisions northeast of Paris, the organization of an American corps sector in the Chateau-Thierry region was taken up with Gen. Petain, and on July 4 the First Corps assumed tactical control of a sector in that region. This was an important step, but it was by no means satisfactory, as only one American division at the moment was operating under the control of the First Corps, while we had at this time eight American divisions in the front line serving in French corps.

20. The counter-offensives against the Marne salient in July, and against the Amiens salient in August had gained such an advantage that it was apparent that the emergency, which justified the dis-

persion of our divisions, had passed. The moment was propitious for assembling our divisions. Scattered as they were along the Allied front, their supply had become very difficult. From every point of view the immediate organization of an independent American force was indicated. The formation of the Army in the Chateau-Thierry region and its early transfer to the sector of the Woevre, which was to extend from Nomeny, east of the Moselle, to north of St. Mihiel, was therefore decided upon by Marshal Foch and myself on August 9, and the details were arranged with Gen. Petain later on the same day.

ST. MIHIEL OPERATION.

21. At Bombon on July 24 there was a conference of all the Commanders-in-Chief for the purpose of considering Allied operations. Each presented proposals for the employment of the armies under his command and these formed the basis of future cooperation of the Allies. It was emphatically determined that the Allied attitude should be to maintain the offensive. As the first operation of the American Army, the reduction of the salient of St. Mihiel was to be undertaken as soon as the necessary troops and material could be made available. On account of the swampy nature of the country it was especially important that the movement be undertaken and finished before the fall rains should begin, which was usually about the middle of September.

Arrangements were concluded for successive relief of American divisions and the organization of the First American Army under my personal command was announced on August 10, with La Ferté-sous-Jouarre as headquarters. This Army nominally assumed control of a portion of the Vesle front, although at the same time directions were given for its secret concentration in the St. Mihiel sector.

22. The force of American soldiers in France at that moment was sufficient to carry out this offensive, but they were dispersed along the front from Switzerland to the Channel. The three Army Corps headquarters to participate in the St. Mihiel attack were the First, Fourth, and Fifth. The First was on the Vesle, the Fourth at Toul, and the Fifth not yet completely organized. To assemble combat divisions and service troops and undertake a major operation, within the short period available and with staffs so recently organized, was an extremely difficult task. Our deficiencies in Artillery, Aviation, and special troops, caused by the shipment of an undue proportion of Infantry and Machine Guns during the summer, were largely met by the French.

23. The reduction of the St. Mihiel salient was important, as it would prevent the enemy from interrupting traffic on the Paris-Nancy Railroad by artillery fire and would free the railroad leading north through St. Mihiel to Verdun. It would also provide us with an advantageous base of departure for an attack against the Metz-Sedan Railroad system which was vital to the German armies west of Verdun, and against the Briey Iron Basin which was necessary for the production of German armament and munitions.

The general plan was to make simultaneous attacks against the flanks of the salient. The ultimate objective was tentatively fixed as the general line Marieulles (east of the Moselle)—heights south of Gorze-Mars la Tour-Etain. The operation contemplated the use on the western face of 3 or 4 American divisions, supported by the attack of 6 divisions of the Second French Army on their left, while 7 American divisions would attack on the southern face, and 3 French divisions would press the enemy at the tip of the salient. As the part to be taken by the Second French Army would be closely related to the attack of the First American Army, Gen. Petain placed all the French troops involved under my personal command.

By August 30, the concentration of the scattered divisions, corps, and army troops, of the quantities of supplies and munitions required, and the necessary construction of light railways and roads, were well under way.

24. In accordance with the previous general consideration of operations at Bombon on July 24, an allied offensive extending practically along the entire active front was eventually to be carried out. After the reduction of the St. Mihiel sector the Americans were to cooperate in the concerted effort of the Allied armies. It was the sense of the conference of July 24, that the extent to which the different operations already planned might carry us could not be then foreseen, especially if the results expected were achieved before the season was far advanced. It seemed reasonable at that time to look forward to a combined offensive for the autumn, which would give no respite to the enemy and would increase our advantage for the inauguration of succeeding operations extending into 1919.

On August 30, a further discussion with Marshal Foch was held at my headquarters at Ligny-en-Barrois. In view of the new successes of the French and British near Amiens and the continued favorable results toward the Chemin des Dames on the French front, it was now believed that the limited allied offensive, which was to prepare for the campaign of 1919, might be carried further before the end of the year. At this meeting it was proposed by Marshal

Foch that the general operations as far as the American Army was concerned should be carried out in detail by:

(a) An attack between the Meuse and the Argonne by the Second French Army, reinforced by from four to six American divisions.

(b) A French-American attack, extending from the Argonne west to the Souain Road, to be executed on the right by an American Army astride the Aisne and on the left by the Fourth French Army.

To carry out these attacks the 10 to 11 American divisions suggested for the St. Mihiel operation and the 4 to 6 for the Second French Army, would leave 8 to 10 divisions for an American Army on the Aisne. It was proposed that the St. Mihiel operation should be initiated on September 10 and the other two on September 15 and 20, respectively.

25. The plan suggested for the American participation in these operations was not acceptable to me because it would require the immediate separation of the recently formed First American Army into several groups, mainly to assist French armies. This was directly contrary to the principle of forming a distinct American Army, for which my contention had been insistent. An enormous amount of preparation had already been made in construction of roads, railroads, regulating stations, and other installations looking to the use and supply of our armies on a particular front. The inherent disinclination of our troops to serve under allied commanders would have grown and American morale would have suffered. My position was stated quite clearly that the strategical employment of the First Army as a unit would be undertaken where desired, but its disruption to carry out these proposals would not be entertained.

A further conference at Marshal Foch's headquarters was held on September 2, at which Gen. Petain was present. After discussion the question of employing the American Army as a unit was conceded. The essentials of the strategical decision previously arrived at provided that the advantageous situation of the Allies should be exploited to the utmost by vigorously continuing the general battle and extending it eastward to the Meuse. All the Allied armies were to be employed in a converging action. The British armies, supported by the left of the French armies, were to pursue the attack in the direction of Cambrai; the center of the French armies, west of Rheims, would continue the actions, already begun, to drive the enemy beyond the Aisne; and the American Army, supported by the right of the French armies, would direct its attack on Sedan and Mezieres.

It should be recorded that although this general offensive was fully outlined at the conference no one present expressed the opinion that the final victory could be won in 1918. In fact, it was believed by the French high command that the Meuse-Argonne attack could not

be pushed much beyond Montfaucon before the arrival of winter would force a cessation of operations.

26. The choice between the two sectors, that east of the Aisne including the Argonne Forest, or the Champagne sector, was left to me. In my opinion, no other Allied troops had the morale or the offensive spirit to overcome successfully the difficulties to be met in the Meuse-Argonne sector and our plans and installations had been prepared for an expansion of operations in that direction. So the Meuse-Argonne front was chosen. The entire sector of 150 kilometers of front, extending from Port-sur-Seille, east of the Moselle, west to include the Argonne Forest, was accordingly placed under my command, including all French divisions then in that zone. The First American Army was to proceed with the St. Mihiel operation, after which the operation between the Meuse and the western edge of the Argonne Forest was to be prepared and launched not later than September 25.

As a result of these decisions, the depth of the St. Mihiel operation was limited to the line Vigneulles - Thiaucourt - Regnieville. The number of divisions to be used was reduced and the time shortened. 18 to 19 divisions were to be in the front line. There were 4 French and 15 American divisions available, 6 of which would be in reserve, while the two flank divisions of the front line were not to advance. Furthermore, 2 Army Corps headquarters, with their corps troops, practically all the Army Artillery and Aviation, and the First, Second, and Fourth Divisions, the first two destined to take a leading part in the St. Mihiel attack, were all due to be withdrawn and started for the Meuse-Argonne by the fourth day of the battle.

27. The salient had been held by the Germans since September, 1914. It covered the most sensitive section of the enemy's position on the Western Front; namely, the Mezieres-Sedan-Metz Railroad and the Briey Iron Basin; it threatened the entire region between Verdun and Nancy, and interrupted the main rail line from Paris to the east. Its primary strength lay in the natural defensive features of the terrain itself. The western face of the salient extended along the rugged, heavily wooded eastern heights of the Meuse; the southern face followed the heights of the Meuse for 8 kilometers to the east and then crossed the plain of the Woevre, including within the German lines the detached heights of Loupmont and Montsec which dominated the plain and afforded the enemy unusual facilities for observation. The enemy had reinforced the positions by every artificial means during a period of four years.

28. On the night of September 11, the troops of the First Army were deployed in position. On the southern face of the salient was the First Corps, Maj. Gen. Liggett, commanding, with the Eighty-

second, Ninetieth, Fifth, and Second Divisions in line, extending from the Moselle westward. On its left was the Fourth Corps, Maj. Gen. Joseph T. Dickman, commanding, with the Eighty-ninth, Forty-second, and First Divisions, the left of this corps being opposite Montsec. These two Army Corps were to deliver the principal attack, the line pivoting on the center division of the First Corps. The First Division on the left of the Fourth Corps was charged with the double mission of covering its own flank while advancing some 20 kilometers due north toward the heart of the salient, where it was to make contact with the troops of the Fifth Corps. On the western face of the salient lay the Fifth Corps, Maj. Gen. George H. Cameron, commanding, with the Twenty-sixth Division, Fifteenth French Colonial Division, and the Fourth Division in line, from Mouilly west to Les Eparges and north to Watronville. Of these three divisions, the Twenty-sixth alone was to make a deep advance directed southeast toward Vigneulles. The French Division was to make a short progression to the edge of the heights in order to cover the left of the Twenty-sixth. The Fourth Division was not to advance. In the center, between our Fourth and Fifth Army Corps, was the Second French Colonial Corps, Maj. Gen. E. J. Blondlat, commanding, covering a front of 40 kilometers with 3 small French divisions. These troops were to follow up the retirement of the enemy from the tip of the salient.

The French independent air force was at my disposal which, together with the British bombing squadrons and our own air forces, gave us the largest assembly of aviation that had ever been engaged in one operation. Our heavy guns were able to reach Metz and to interfere seriously with German rail movements.

At dawn on September 12, after four hours of violent artillery fire of preparation, and accompanied by small tanks, the Infantry of the First and Fourth Corps advanced. The infantry of the Fifth Corps commenced its advance at 8 a. m. The operation was carried out with entire precision. Just after daylight on September 13, elements of the First and Twenty-sixth Divisions made a junction near Hattonchatel and Vigneulles, 18 kilometers northeast of St. Mihiel. The rapidity with which our divisions advanced overwhelmed the enemy, and all objectives were reached by the afternoon of September 13. The enemy had apparently started to withdraw some of his troops from the tip of the salient on the eve of our attack, but had been unable to carry it through. We captured nearly 16,000 prisoners, 443 guns, and large stores of material and supplies. The energy and swiftness with which the operation was carried out enabled us to smother opposition to such an extent that we suffered less than 7,000 casualties during the actual period of the advance.

During the next two days the right of our line west of the Moselle River was advanced beyond the objectives laid down in the original orders. This completed the operation for the time being and the line was stabilized to be held by the smallest practicable force.

29. The material results of the victory achieved were very important. An American Army was an accomplished fact, and the enemy had felt its power. No form of propaganda could overcome the depressing effect on the morale of the enemy of this demonstration of our ability to organize a large American force and drive it successfully through his defenses. It gave our troops implicit confidence in their superiority and raised their morale to the highest pitch. For the first time wire entanglements ceased to be regarded as impassable barriers and open-warfare training, which had been so urgently insisted upon, proved to be the correct doctrine. Our divisions concluded the attack with such small losses and in such high spirits that without the usual rest they were immediately available for employment in heavy fighting in a new theater of operations. The strength of the First Army in this battle totaled approximately 500,000 men, of whom about 70,000 were French.

MEUSE-ARGONNE OPERATION.

30. The definite decision for the Meuse-Argonne phase of the great allied convergent attack was agreed to in my conference with Marshal Foch and Gen. Petain on September 2. It was planned to use all available forces of the First Army, including such divisions and troops as we might be able to withdraw from the St. Mihiel front. The Army was to break through the enemy's successive fortified zones to include the Kriemhilde-Stellung, or Hindenburg Line, on the front Brioules-Romagne sous Montfaucon-Grandpre, and thereafter, by developing pressure toward Mezieres, was to insure the fall of the Hindenburg Line along the Aisne River in front of the Fourth French Army, which was to attack to the west of the Argonne Forest. A penetration of some 12 to 15 kilometers was required to reach the Hindenburg Line on our front, and the enemy's defenses were virtually continuous throughout that depth.

The Meuse-Argonne front had been practically stabilized in September, 1914, and, except for minor fluctuations during the German attacks on Verdun in 1916 and the French counteroffensive in August, 1917, remained unchanged until the American advance in 1918. The net result of the four years' struggle on this ground was a German defensive system of unusual depth and strength and a wide zone of utter devastation, itself a serious obstacle to offensive operations.

31. The strategical importance of this portion of the line was second to none on the western front. All supplies and evacuations of the German armies in northern France were dependent upon two great railway systems—one in the north, passing through Liege, while the other in the south, with lines coming from Luxemburg, Thionville, and Metz, had as its vital section the line Carignan-Sedan-Mezieres. No other important lines were available to the enemy, as the mountainous masses of the Ardennes made the construction of east and west lines through that region impracticable. The Carignan-Sedan-Mezieres line was essential to the Germans for the rapid strategical movement of troops. Should this southern system be cut by the Allies before the enemy could withdraw his forces through the narrow neck between Mezieres and the Dutch frontier, the ruin of his armies in France and Belgium would be complete.

From the Meuse-Argonne front the perpendicular distance to the Carignan-Mezieres railroad was 50 kilometers. This region formed the pivot of German operations in northern France, and the vital necessity of covering the great railroad line into Sedan resulted in the convergence on the Meuse-Argonne front of the successive German defensive positions. The effect of this convergence can be best understood by reference to plate No. 3. It will be seen, for example, that the distance between "no man's land" and the third German withdrawal position in the vicinity of the Meuse River was approximately 18 kilometers; the distance between the corresponding points near the tip of the great salient of the western front was about 65 kilometers, and in the vicinity of Cambrai was over 30 kilometers. The effect of a penetration of 18 kilometers by the American Army would be equivalent to an advance of 65 kilometers farther west; furthermore, such an advance on our front was far more dangerous to the enemy than an advance elsewhere. The vital importance of this portion of his position was fully appreciated by the enemy, who had suffered tremendous losses in 1916 in attempting to improve it by the reduction of Verdun. As a consequence it had been elaborately fortified, and consisted of practically a continuous series of positions 20 kilometers or more in depth.

In addition to the artificial defenses, the enemy was greatly aided by the natural features of the terrain. East of the Meuse the dominating heights not only protected his left but gave him positions from which powerful artillery could deliver an oblique fire on the western bank. Batteries located in the elaborately fortified Argonne forest covered his right flank, and could cross their fire with that of the guns on the east bank of the Meuse. Midway between the Meuse and the forest the heights of Montfaucon offered perfect observation and formed a strong natural position which had been heavily fortified. The east and west ridges abutting on the Meuse and Aire

River valleys afforded the enemy excellent machine-gun positions for the desperate defense which the importance of the position would require him to make. North of Montfaucon densely wooded and rugged heights constituted natural features favorable to defensive fighting.

32. When the First Army became engaged in the simultaneous preparation for two major operations, an interval of 14 days separated the initiation of the two attacks. During this short period the movement of the immense number of troops and the amount of supplies involved in the Meuse-Argonne battle, over the few roads available, and confined entirely to the hours of darkness, was one of the most delicate and difficult problems of the war. The concentration included 15 divisions, of which 7 were involved in the pending St. Mihiel drive, 3 were in sector in the Vosges, 3 in the neighborhood of Soissons, 1 in a training area, and 1 near Bar-le-Duc. Practically all the Artillery, Aviation, and other auxiliaries to be employed in the new operations were committed to the St. Mihiel attack and therefore could not be moved until its success was assured. The concentration of all units not to be used at St. Mihiel was commenced immediately, and on September 13, the second day of St. Mihiel, reserve divisions and Army Artillery units were withdrawn and placed in motion toward the Argonne front.

That part of the American sector from Fresnes-en-Woevre, southeast of Verdun, to the western edge of the Argonne Forest, while nominally under my control, did not actively become a part of my command until September 22, on which date my headquarters were established at Souilly, southwest of Verdun. Of French troops, in addition to the Second French Colonial Corps, composed of 3 divisions, there was also the Seventeenth French Corps of 3 divisions holding the front north and east of Verdun.

33. At the moment of the opening of the Meuse-Argonne battle, the enemy had 10 divisions in line and 10 in reserve on the front between Fresnes-en-Woevre and the Argonne Forest, inclusive. He had undoubtedly expected a continuation of our advance toward Metz. Successful ruses were carried out between the Meuse River and Luneville to deceive him as to our intentions, and French troops were maintained as a screen along our front until the night before the battle, so that the actual attack was a tactical surprise.

34. The operations in the Meuse-Argonne battle really form a continuous whole, but they extended over such a long period of continuous fighting that they will here be considered in three phases, the first from September 26 to October 3, the second from October 4 to 31, and the third from November 1 to 11.

MEUSE-ARGONNE, FIRST PHASE.

35. On the night of September 25, the 9 divisions to lead in the attack were deployed between the Meuse River and the western edge of the Argonne Forest. On the right was the Third Corps, Maj. Gen. Bullard commanding, with the Thirty-third, Eightieth, and Fourth Divisions in line; next came the Fifth Corps, Maj. Gen. Cameron commanding, with the Seventy-Ninth, Thirty-seventh, and Ninety-first Divisions; on the left was the First Corps, Maj. Gen. Liggett commanding, with the Thirty-fifth, Twenty-eighth, and Seventy-seventh Divisions. Each corps had 1 division in reserve and the Army held 3 divisions as a general reserve. About 2,700 guns, 189 small tanks, 142 manned by Americans, and 821 airplanes, 604 manned by Americans, were concentrated to support the attack of the infantry. We thus had a superiority in guns and aviation, and the enemy had no tanks.

The axis of the attack was the line Montfaucon-Romagne-Buzancy, the purpose being to make the deepest penetration in the center, which, with the Fourth French Army advancing west of the Argonne, would force the enemy to evacuate that forest without our having to deliver a heavy attack in that difficult region.

36. Following three hours of violent artillery fire of preparation, the Infantry advanced at 5.30 a. m. on September 26, accompanied by tanks. During the first two days of the attack, before the enemy was able to bring up his reserves, our troops made steady progress through the network of defenses. Montfaucon was held tenaciously by the enemy and was not captured until noon of the second day.

By the evening of the 28th a maximum advance of 11 kilometers had been achieved and we had captured Baulny, Epinonville, Septsarges, and Dannevoux. The right had made a splendid advance into the woods south of Brioules-sur-Meuse, but the extreme left was meeting strong resistance in the Argonne. The attack continued without interruption, meeting six new divisions which the enemy threw into first line before September 29. He developed a powerful machine gun defense supported by heavy artillery fire, and made frequent counter-attacks with fresh troops, particularly on the front of the Twenty-eighth and Thirty-fifth Divisions. These divisions had taken Varennes, Cheppy, Baulny, and Charpentry, and the line was within 2 kilometers of Apremont. We were no longer engaged in a maneuver for the pinching out of a salient, but were necessarily committed, generally speaking, to a direct frontal attack against strong, hostile positions fully manned by a determined enemy.

37. By nightfall of the 29th the First Army line was approximately Bois de la Cote Lemont—Nantillois—Apremont—southwest across the Argonne. Many divisions, especially those in the center

that were subjected to cross-fire of artillery, had suffered heavily. The severe fighting, the nature of the terrain over which they attacked, and the fog and darkness sorely tried even our best divisions. On the night of the 29th the Thirty-seventh and Seventy-ninth Divisions were relieved by the Thirty-second and Third Divisions, respectively, and on the following night the First Division relieved the Thirty-fifth Division.

38. The critical problem during the first few days of the battle was the restoration of communications over "no man's land." There were but four roads available across this deep zone, and the violent artillery fire of the previous period of the war had virtually destroyed them. The spongy soil and the lack of material increased the difficulty. But the splendid work of our engineers and pioneers soon made possible the movement of the troops, artillery, and supplies most needed. By the afternoon of the 27th all the divisional artillery, except a few batteries of heavy guns, had effected a passage and was supporting the infantry action.

MEUSE-ARGONNE, SECOND PHASE.

39. At 5.30 a. m. on October 4 the general attack was renewed. The enemy divisions on the front from Fresnes-en-Woevre to the Argonne had increased from 10 in first line to 16, and included some of his best divisions. The fighting was desperate, and only small advances were realized, except by the First Division on the right of the First Corps. By evening of October 5 the line was approximately Bois de la Cote Lemont-Bois du Fays-Gesnes-Hill 240-Fleville-Chehery, southwest through the Argonne.

It was especially desirable to drive the enemy from his commanding positions on the heights east of the Meuse, but it was even more important that we should force him to use his troops there and weaken his tenacious hold on positions in our immediate front. The further stabilization of the new St. Mihiel line permitted the withdrawal of certain divisions for the extension of the Meuse-Argonne operation to the east bank of the Meuse River.

40. On the 7th the First Corps, with the Eighty-second Division added, launched a strong attack northwest toward Cornay, to draw attention from the movement east of the Meuse and at the same time outflank the German position in the Argonne. The following day the Seventeenth French Corps, Maj. Gen. Claudel commanding, initiated its attack east of the Meuse against the exact point on which the German armies must pivot in order to withdraw from northern France. The troops encountered elaborate fortifications and stubborn resistance, but by nightfall had realized an advance of 6 kilometers to a line well within the Bois de Consenvoye, and including

the villages of Beaumont and Haumont. Continuous fighting was maintained along our entire battle front, with especial success on the extreme left, where the capture of the greater part of the Argonne Forest was completed. The enemy contested every foot of ground on our front in order to make more rapid retirements farther west and withdraw his forces from northern France before the interruption of his railroad communications through Sedan.

41. We were confronted at this time by an insufficiency of replacements to build up exhausted divisions. Early in October combat units required some 90,000 replacements, and not more than 45,000 would be available before November 1 to fill the existing and prospective vacancies. We still had two divisions with the British and two with the French. A review of the situation, American and Allied, especially as to our own resources in men for the next two months, convinced me that the attack of the First Army and of the Allied Armies further west should be pushed to the limit. But if the First Army was to continue its aggressive tactics our divisions then with the French must be recalled, and replacements must be obtained by breaking up newly arrived divisions.

In discussing the withdrawal of our divisions from the French with Marshal Foch and Gen. Petain, on October 10, the former expressed his appreciation of the fact that the First Army was striking the pivot of the German withdrawal, and also held the view that the Allied attack should continue. Gen. Petain agreed that the American divisions with the French were essential to us if we were to maintain our battle against the German pivot. The French were, however, straining every nerve to keep up their attacks and, before those divisions with the French had been released, it became necessary for us to send the Thirty-seventh and Ninety-first Divisions from the First Army to assist the Sixth French Army in Flanders.

42. At this time the First Army was holding a front of more than 120 kilometers; its strength exceeded 1,000,000 men; it was engaged in the most desperate battle of our history, and the burden of command was too heavy for a single commander and staff. Therefore, on October 12, that portion of our front extending from Port-sur-Seille, east of the Moselle, to Fresnes-en-Woevre, south-east of Verdun, was transferred to the newly constituted Second Army with Lieut. Gen. Robert L. Bullard in command, under whom it began preparations for the extension of operations to the east in the direction of Briey and Metz. On October 16 the command of the First Army was transferred to Lieut. Gen. Hunter Liggett, and my advance headquarters was established at Ligny-en-Barrois, from which the command of the group of American Armies was exercised.

43. Local attacks of the First Army were continued in order particularly to adjust positions preparatory to a renewed general assault. The First and Fifth Divisions were relieved by the Forty-second and Eightieth Divisions, which were now fresh. An attack along the whole front was made on October 14. The resistance encountered was stubborn, but the stronghold on Cote Dame Marie was captured and the Hindenburg Line was broken. Cunel and Romagne-sous-Montfaucon were taken and the line advanced 2 kilometers north of Sommerance. A maximum advance of 17 kilometers had been made since September 26 and the enemy had been forced to throw into the fight a total of 15 reserve divisions.

During the remainder of the month important local operations were carried out, which involved desperate fighting. The First Corps, Maj. Gen. Dickman commanding, advanced through Grandpre; the Fifth Corps, Maj. Gen. Charles P. Summerall commanding, captured the Bois de Bantheville; the Third Corps, Maj. Gen. John L. Hines commanding, completed the occupation of Cunel Heights; and the Seventeenth French Corps drove the enemy from the main ridge south of La Grande Montagne. Particularly heavy fighting occurred east of the Meuse on October 18, and in the further penetration of the Kriemhilde-Stellung on October 23 the Twenty-sixth Division entering the battle at this time relieved the Eighteenth French Division.

44. Summarizing the material results which had been attained by the First Army by the end of October, we had met an increasing number of Germany's best divisions, rising from 20 in line and reserve on September 26, to 31 on October 31; the enemy's elaborately prepared positions, including the Hindenburg line, in our front had been broken; the almost impassable Argonne Forest was in our hands; an advance of 21 kilometers had been effected; 18,600 prisoners, 370 cannon, 1,000 machine guns, and a mass of material captured; and the great railway artery through Carignan to Sedan was now seriously threatened.

The demands of incessant battle which had been maintained day by day for more than a month had compelled our divisions to fight to the limit of their capacity. Combat troops were held in line and pushed to the attack until deemed incapable of further effort because of casualties or exhaustion; artillery once engaged was seldom withdrawn and many batteries fought until practically all the animals were casualties and the guns were towed out of line by motor trucks. The American soldier had shown unrivaled fortitude in this continuous fighting during most inclement weather and under many disadvantages of position. Through experience, the Army had developed into a powerful and smooth-running machine, and there

was a supreme confidence in our ability to carry through the task successfully.

While the high pressure of these dogged attacks was a great strain on our troops, it was calamitous to the enemy. His divisions had been thrown into confusion by our furious assaults, and his morale had been reduced until his will to resist had well-nigh reached the breaking point. Once a German division was engaged in the fight, it became practically impossible to effect its relief. The enemy was forced to meet the constantly recurring crises by breaking up tactical organizations and sending hurried detachments to widely separated portions of the field.

Every member of the American Expeditionary Forces, from the front line to the base ports, was straining every nerve. Magnificent efforts were exerted by the entire Services of Supply to meet the enormous demands made on it. Obstacles which seemed insurmountable were overcome daily in expediting the movements of replacements, ammunition and supplies to the front, and of sick and wounded to the rear. It was this spirit of determination animating every American soldier that made it impossible for the enemy to maintain the struggle until 1919.

MEUSE-ARGONNE, THIRD PHASE.

45. The detailed plans for the operations of the Allied Armies on the western front changed from time to time during the course of this great battle, but the mission of the First American Army to cut the great Carignan-Sedan-Mezieres Railroad remained unchanged. Marshal Foch coordinated the operations along the entire front, continuing persistently and unceasingly the attacks by all Allied Armies; the Belgian Army, with a French Army and two American divisions, advancing eastward; the British Armies and two American divisions, with the First French Army on their right, toward the region north of Givet; the First American Army and Fourth French Army, toward Sedan and Mezieres.

46. On the 21st my instructions were issued to the First Army to prepare thoroughly for a general attack on October 28, that would be decisive if possible. In order that the attack of the First Army and that of the Fourth French Army on its left should be simultaneous, our attack was delayed until November 1. The immediate purpose of the First Army was to take Buzancy and the heights of Barricourt, to turn the forest north of Grandpre, and to establish contact with the Fourth French Army near Boulton-aux-Bois. The Army was directed to carry the heights of Barricourt by nightfall of the first day and then to exploit this success by advancing its left to Boulton-aux-Bois in preparation for the drive toward Sedan. By strenuous

effort all available artillery had been moved well forward to the heights previously occupied by the enemy, from which it could fully cover and support the initial advance of the Infantry.

On this occasion and for the first time the Army prepared for its attack under normal conditions. We held the front of attack and were not under the necessity of taking over a new front, with its manifold installations and services. Our own personnel handled the communications, dumps, telegraph lines, and water service; our divisions were either on the line or close in rear; the French artillery, aviation, and technical troops which had previously made up our deficiencies had been largely replaced by our own organizations; and our army, corps, and divisional staffs were by actual experience second to none.

47. On the morning of November 1, three Army corps were in line between the Meuse River and the Bois de Bourgogne. On the right the Third Corps had the Fifth and Ninetieth Divisions; the Fifth Corps occupied the center of the line, with the Eighty-ninth and Second Divisions, and was to be the wedge of the attack on the first day; and on the left the First Corps deployed the Eightieth, Seventy-seventh, and Seventy-eighth Divisions.

Preceded by two hours of violent artillery preparation, the Infantry advanced, closely followed by "accompanying guns." The Artillery acquitted itself magnificently, the barrages being so well coordinated and so dense that the enemy was overwhelmed and quickly submerged by the rapid onslaught of the Infantry. By nightfall the Fifth Corps, in the center, had realized an advance of almost 9 kilometers, to the Bois de la Folie, and had completed the capture of the heights of Barricourt, while the Third Corps, on the right, had captured Ainereville and Andevanne. Our troops had broken through the enemy's last defense, captured his artillery positions, and had precipitated a retreat of the German forces about to be isolated in the forest north of Grandpre. On the 2d and 3d we advanced rapidly against heavy fighting on the fronts of the right and center corps; to the left the troops of the First Corps hurried forward in pursuit, some by motor trucks, while the Artillery pressed along the country roads close behind. Our heavy artillery was skillfully brought into position to fire upon the Carignan-Sedan Railroad and the junctions at Longuyon and Conflans. By the evening of the 4th, our troops had reached La Neuville, opposite Stenay, and had swept through the great Forêt de Dieulet, reaching the outskirts of Beaumont, while on the left we were 8 kilometers north of Boulton-aux-Bois.

The following day the advance continued toward Sedan with increasing swiftness. The Third Corps, turning eastward, crossed the

Meuse in a brilliant operation by the Fifth Division, driving the enemy from the heights of Dun-sur-Meuse and forcing a general withdrawal from the strong positions he had so long held on the hills north of Verdun.

By the 7th the right of the Third Corps had exploited its river crossing to a distance of 10 kilometers east of the Meuse, completely ejecting the enemy from the wooded heights and driving him out into the swampy plain of the Woivre; the Fifth and First Corps had reached the line of the Meuse River along their respective fronts and the left of the latter corps held the heights dominating Sedan, the strategical goal of the Meuse-Argonne operation, 41 kilometers from our point of departure on November 1. We had cut the enemy's main line of communications. Recognizing that nothing but a cessation of hostilities could save his armies from complete disaster, he appealed for an immediate armistice on November 6.

48. Meanwhile general plans had been prepared for the further employment of American forces in an advance between the Meuse and the Moselle, to be directed toward Longwy by the First Army, while the Second Army was to assume the offensive toward the Briey Iron Basin. Orders directing the preparatory local operations involved in this enterprise were issued on November 5.

Between the 7th and 10th of November the Third Corps continued its advance eastward to Remoiville, while the Seventeenth French Corps, on its right, with the Seventy-ninth, Twenty-sixth, and Eighty-first American Divisions, and 2 French divisions, drove the enemy from his final foothold on the heights east of the Meuse. At 9 p. m. on November 9 appropriate orders were sent to the First and Second Armies in accordance with the following telegram from Marshal Foch to the Commander of each of the Allied armies:

"The enemy, disorganized by our repeated attacks, retreats along the entire front.

It is important to coordinate and expedite our movements.

I appeal to the energy and the initiative of the Commanders-in-Chief and of their armies to make decisive the results obtained."

In consequence of the foregoing instructions, our Second Army pressed the enemy along its entire front. On the night of the 10th-11th and the morning of the 11th the Fifth Corps, in the First Army, forced a crossing of the Meuse east of Beaumont and gained the commanding heights within the reentrant of the river, thus completing our control of the Meuse River line. At 6 a. m. on the 11th notification was received from Marshal Foch's headquarters that the Armistice had been signed and that hostilities would cease at 11 a. m. Preparatory measures had already been taken to insure the prompt transmission to the troops of the announcement of an Armistice. However, the advance east of Beaumont on the morning of the 11th

had been so rapid and communication across the river was so difficult that there was some fighting on isolated portions of that front after 11 a. m.

49. Between September 26 and November 11, 22 American and 4 French divisions, on the front extending from southeast of Verdun to the Argonne Forest, had engaged and decisively beaten 47 different German divisions, representing 25 per cent of the enemy's entire divisional strength on the western front. Of these enemy divisions 20 had been drawn from the French front and 1 from the British front. Of the 22 American divisions 12 had, at different times during this period, been engaged on fronts other than our own. The First Army suffered a loss of about 117,000 in killed and wounded. It captured 26,000 prisoners, 847 cannon, 3,000 machine guns, and large quantities of material.

The dispositions which the enemy made to meet the Meuse-Argonne offensive, both immediately before the opening of the attack and during the battle, demonstrated the importance which he ascribed to this section of the front and the extreme measures he was forced to take in its defense. From the moment the American offensive began until the Armistice, his defense was desperate and the flow of his divisions to our front was continuous. The rate at which German divisions were used up is illustrated by plate 7, which shows an increase of 27 divisions on the American front during the battle.

OPERATIONS OF THE SECOND ARMY.

50. Under the instructions issued by me on November 5, for operations by the Second Army in the direction of the Briey Iron Basin, the advance was undertaken along the entire front of the army and continued during the last three days of hostilities. In the face of the stiff resistance offered by the enemy, and with the limited number of troops at the disposal of the Second Army, the gains realized reflected great credit on the divisions concerned. On November 6 Marshal Foch requested that 6 American divisions be held in readiness to assist in an attack which the French were preparing to launch in the direction of Chateau-Salins. The plan was agreed to, but with the provision that our troops should be employed under the direction of the commanding general Second Army.

This combined attack was to be launched on November 14, and was to consist of 20 French divisions under Gen. Mangin and the 6 American divisions under Gen. Bullard. Of the divisions designated for this operation the Third, Fourth, Twenty-ninth, and Thirty-sixth were in Army reserve and were starting their march eastward on the morning of November 11, while the Twenty-eighth and Thirty-fifth were being withdrawn from line on the Second Army front.

AMERICAN ACTIVITIES ON OTHER FRONTS.

51. During the first phase of the Meuse-Argonne battle, American divisions were participating in important attacks on other portions of the front. The Second Army Corps, Maj. Gen. Read, commanding, with the Twenty-seventh and Thirtieth Divisions on the British front, was assigned the task in cooperation with the Australian Corps, of breaking the Hindenburg line at Le Cateau, where the St. Quentin Canal passes through a tunnel under a ridge. In this attack, carried out on September 29 and October 1, the Thirtieth Division speedily broke through the main line of defense and captured all of its objectives, while the Twenty-seventh progressed until some of its elements reached Gouy. In this and later actions from October 6 to 19, our Second Corps captured over 6,000 prisoners and advanced about 24 kilometers.

52. On October 2-9 our Second and Thirty-sixth Divisions assisted the Fourth French Army in its advance between Rheims and the Argonne. The Second Division completed its advance on this front by the assault of the wooded heights of Mont Blanc, the key point of the German position, which was captured with consummate dash and skill. The division here repulsed violent counterattacks, and then carried our lines into the village of St. Etienne, thus forcing the Germans to fall back before Rheims and yield positions which they had held since September, 1914. On October 10 the Thirty-sixth Division relieved the Second, exploiting the latter's success, and in two days advanced, with the French, a distance of 21 kilometers, the enemy retiring behind the Aisne River.

53. In the middle of October, while we were heavily engaged in the Meuse-Argonne, Marshal Foch requested that 2 American divisions be sent immediately to assist the Sixth French Army in Belgium, where slow progress was being made. The Thirty-seventh and Ninety-first Divisions, the latter being accompanied by the Artillery of the Twenty-eighth Division, were hurriedly dispatched to the Belgian front. On October 30, in continuation of the Flanders offensive, these divisions entered the line and attacked. By November 3 the Thirty-seventh Division had completed its mission by rapidly driving the enemy across the Escaut River and had firmly established itself on the east bank, while the Ninety-first Division, in a spirited advance, captured Spitaals Bosschen, reached the Scheldt, and entered Audenarde.

AMERICAN TROOPS IN ITALY.

54. The Italian Government early made request for American troops, but the critical situation on the western front made it necessary to concentrate our efforts there. When the Secretary of War

was in Italy during April, 1918, he was urged to send American troops to Italy to show America's interest in the Italian situation and to strengthen Italian morale. Similarly a request was made by the Italian Prime Minister at the Abbeville conference. It was finally decided to send one regiment to Italy with the necessary hospital and auxiliary services, and the Three hundred and thirty-second Infantry was selected, reaching the Italian front in July, 1918. These troops participated in action against the Austrians in the fall of 1918 at the crossing of the Piave River and in the final pursuit of the Austrian Army.

AMERICAN TROOPS IN RUSSIA.

55. It was the opinion of the Supreme War Council that Allied troops should be sent to cooperate with the Russians, either at Murmansk or Archangel, against the Bolshevist forces, and the British Government, through its ambassador at Washington, urged American participation in this undertaking. On July 23, 1918, the War Department directed the dispatch of three battalions of Infantry and three companies of Engineers to join the Allied expedition. In compliance with these instructions the Three hundred and thirty-ninth Infantry, the First Battalion, Three hundred and tenth Engineers, Three hundred and thirty-seventh Field Hospital Company, and Three hundred and thirty-seventh Ambulance Company were sent through England, whence they sailed on August 26.

The mission of these troops was limited to guarding the ports and as much of the surrounding country as might develop threatening conditions. The Allied force operated under British command, through whose orders the small American contingent was spread over a front of about 450 miles. From September, 1918, to May, 1919, a series of minor engagements with the Bolshevist forces occurred, in which 82 Americans were killed and 7 died of wounds.

In April, 1919, two companies of American railroad troops were added to our contingent. The withdrawal of the American force commenced in the latter part of May, 1919, and on August 25 there was left only a small detachment of Graves Registration troops.

THE ADVANCE INTO GERMANY.

56. In accordance with the terms of the Armistice, the Allies were to occupy all German territory west of the Rhine, with bridgeheads of 30 kilometer radius at Cologne, Coblenz, and Mayence. The zone assigned the American command was the bridgehead of Coblenz and the district of Treves. This territory was to be occupied by an American Army, with its reserves held between the Moselle-Meuse Rivers and the Luxemburg frontier.

The instructions of Marshal Foch, issued on November 16, contemplated that 2 French infantry divisions and 1 French cavalry division would be added to the American forces that occupied the Coblenz bridgehead, and that 1 American division would be added to the French force occupying the Mayence bridgehead. As this arrangement presented possibilities of misunderstanding due to difference of views regarding the government of occupied territory, it was represented to the Marshal that each nation should be given a well-defined territory of occupation, employing within such territory only the troops of the commander responsible for the particular zone. On December 9 Marshal Foch accepted the principle of preserving the entity of command and troops, but reduced the American bridgehead by adding a portion of the eastern half to the French command at Mayence.

57. Various reasons made it undesirable to employ either the First or Second Army as the Army of Occupation. Plans had been made before the Armistice to organize a Third Army and, on November 14, this army, with Maj. Gen. Joseph T. Dickman as commander, was designated as the Army of Occupation. The Third and Fourth Army Corps staffs and troops, less artillery, the First, Second, Third, Fourth, Thirty-second, and Forty-second Divisions, and the Sixty-sixth Field Artillery Brigade were assigned to the Third Army. This force was later increased by the addition of the Seventh Corps, Maj. Gen. William M. Wright commanding, with the Fifth, Eighty-ninth, and Ninetieth Divisions.

The advance toward German territory began on November 17 at 5 a. m., six days after signing the Armistice. All of the allied forces from the North Sea to the Swiss border moved forward simultaneously in the wake of the retreating German armies. Upon arrival at the frontier, a halt was made until December 1, when the leading elements of all Allied armies crossed the line into Germany. The Third Army Headquarters were established at Coblenz and an Advance General Headquarters located at Treves. Steps were immediately taken to organize the bridgehead for defense, and dispositions were made to meet a possible renewal of hostilities.

The advance to the Rhine required long arduous marches, through cold and inclement weather, with no opportunity for troops to rest, refit, and refresh themselves after their participation in the final battle. The Army of Occupation bore itself splendidly and exhibited a fine state of discipline both during the advance and throughout the period of occupation.

58. The zone of march of our troops into Germany and the line of communications of the Third Army after reaching the Rhine lay through Luxemburg. After the passage of the Third Army, the occupation of Luxemburg, for the purpose of guarding our line of

communications, was intrusted to the Fifth and Thirty-third Divisions of the Second Army. The city of Luxemburg, garrisoned by French troops and designated as the headquarters of the Allied Commander-in-Chief, was excluded from our control.

Upon entering the Duchy of Luxemburg in the advance, a policy of noninterference in the affairs of the Grand Duchy was announced. Therefore, when the French commander in the city of Luxemburg was given charge of all troops in the Duchy, in so far as concerned the "administration of the Grand Duchy of Luxemburg," my instructions were that our troops would not be subject to his control. Later, at my request, and in order to avoid possible friction, Marshal Foch placed the entire Duchy in the American Zone.

RETURN OF TROOPS TO THE UNITED STATES.

59. On the day the Armistice was signed, the problem of the return of our troops to the United States was taken up with the War Department and, on November 15, a policy recommended of sending home certain auxiliaries so that we could begin to utilize all available shipping without delay. On December 21 the War Department announced by cable that it had been decided to begin immediately the return of our forces and continue as rapidly as transportation would permit. To carry this out, a schedule for the constant flow of troops to the ports was established, having in mind our international obligations pending the signing of the treaty of peace.

60. While more intimately related to the functions of the Services of Supply than to Operations, it is logical to introduce here a brief recital of the organizations created for the return of our troops to America. Prior to the Armistice but 15,000 men had been returned home. Although the existing organization was built for the efficient and rapid handling of the incoming forces, the embarkation of this small number presented no difficulties. But the Armistice suddenly and completely reversed the problem of the Services of Supply at the ports and the handling of troops. It became necessary immediately to reorganize the machinery of the ports, to construct large embarkation camps, and to create an extensive service for embarking the homeward-bound troops.

Brest, St. Nazaire, and Bordeaux became the principal embarkation ports, Marseilles and Le Havre being added later to utilize Italian and French liners. The construction of the embarkation camps during unseasonable winter weather was the most trying problem. These, with the billeting facilities available, gave accommodation for 55,000 at Brest, 44,000 at St. Nazaire, and 130,000 at Bordeaux. Unfortunately, the largest ships had to be handled at Brest, where the least shelter was available.

To maintain a suitable reservoir of men for Brest and St. Nazaire, an Embarkation Center was organized around Le Mans, which eventually accommodated 230,000 men. Here the troops and their records were prepared for the return voyage and immediate demobilization. As the troops arrived at the base ports, the embarkation service was charged with feeding, reclothing, and equipping the hundreds of thousands who passed through, which required the maintenance of a form of hotel service on a scale not hitherto attempted.

61. On November 16 all combat troops, except 30 divisions and a minimum of corps and army troops, were released for return to the United States. It was early evident that only limited use would be made of the American divisions, and that the retention of 30 divisions was not necessary. Marshal Foch considered it indispensable to maintain under arms a total, including Italians, of 120 to 140 divisions, and he proposed that we maintain 30 divisions in France until February 1, 25 of which should be held in the Zone of the Armies, and that on March 1 we should have 20 divisions in the Zone of the Armies and 5 ready to embark. The plan for March 1 was satisfactory, but the restrictions as to the divisions that should be in France on February 1 could not be accepted, as it would seriously interfere with the flow of troops homeward.

In a communication dated December 24 the Marshal set forth the minimum forces to be furnished by the several Allies, requesting the American Army to furnish 22 to 25 divisions of Infantry. In the same note he estimated the force to be maintained after the signing of the preliminaries of peace at about 32 divisions, of which the American Army was to furnish 6.

In reply it was pointed out that our problem of repatriation of troops and their demobilization was quite different from that of France or Great Britain. On account of our long line of communications in France and the time consumed by the ocean voyage and travel in the United States, even with the maximum employment of our then available transportation, at least a year must elapse before we could complete our demobilization. Therefore, it was proposed by me that the number of American combat divisions to be maintained in the Zone of the Armies should be reduced on April 1 to 15 divisions and on May 1 to 10 divisions, and that in the unexpected event that the preliminaries of peace should not be signed by May 1 we would continue to maintain 10 divisions in the Zone of the Armies until the date of signature.

The Allied Commander-in-Chief later revised his estimate, and, on January 24, stated to the Supreme War Council that the German demobilization would permit the reduction of the Allied forces to 100 divisions, of which the Americans were requested to furnish 15. In reply, it was again pointed out that our problem was entirely one

of transportation, and that such a promise was unnecessary inasmuch as it would probably be the summer of 1919 before we could reduce our forces below the number asked. We were, therefore, able to keep our available ships filled, and by May 19 all combat divisions, except 5 still in the Army of Occupation, were under orders to proceed to ports of embarkation. This provided sufficient troops to utilize all troop transports to include July 15.

62. The President had informed me that it would be necessary for us to have at least one regiment in occupied Germany, and left the details to be discussed by me with Marshal Foch. My cable of July 1 summarizes the agreement reached:

"By direction of President, I have discussed with Marshal Foch question of forces to be left on the Rhine. Following agreed upon: The Fourth and Fifth Divisions will be sent to base ports immediately, the Second Division will commence moving to base ports on July 15, and the Third Division on August 15. Date of relief of First Division will be decided later. Agreement contemplates that after compliance by Germany with military conditions to be completed within first three months after German ratification of treaty, American force will be reduced to one regiment of Infantry and certain auxiliaries. Request President be informed of agreement."

As a result of a later conference with Marshal Foch, the Third Division was released on August 3 and the First Division on August 15.

PART III.

SUPPLY, COORDINATION, MUNITIONS, AND ADMINISTRATION.

THE SERVICES OF SUPPLY.

1. In February, 1918, the Line of Communications was reorganized under the name of the Services of Supply. At that time all staff services and departments, except The Adjutant General's, the Inspector General's, and the Judge Advocate General's Departments, were grouped for supply purposes under one coordinating head, the Commanding General, Services of Supply, with a General Staff paralleling, so far as necessary, the General Staff at General Headquarters.

The principal functions of the Services of Supply were the procurement, storage, and transportation of supplies. These activities were controlled in a general way by the commanding general Services of Supply, the maximum degree of independence being permitted to the several services. This great organization was charged with immense projects in connection with roads, docks, railroads, and buildings; the transportation of men, animals, and supplies by sea, rail, and inland waterways; the operation of telegraph and telephone systems; the control and transportation of replacements; the hospitalization necessary for an army of 2,000,000 men; the reclassification of numerous officers and men; the establishment of leave areas and of welfare and entertainment projects; the liquidation of our affairs in France; and the final embarkation of our troops for home.

The growth of the permanent port personnel, the location near the base ports of certain units for training, and other considerations led to the appointment of a territorial commander for the section around each port who, while acting as the representative of the commanding general Services of Supply, was given the local authority of a district commander. For similar reasons, an Intermediate Section Commander and an Advance Section Commander were appointed. Eventually there were nine base sections, including one in England, one in Italy, and one comprising Rotterdam and Antwerp, also one intermediate and one advance section.

The increasing participation of the American Expeditionary Forces in active operations necessitated the enlargement of the responsibilities and authority of the commanding general Services of Supply. In August, 1918, he was charged with complete responsibility for all supply matters in the Services of Supply, and was authorized to correspond by cable directly with the War Department on all matters of supply not involving questions of policy.

In the following discussion of the Services of Supply the subjects of coordination of supply at the front, ocean tonnage, and replacements are included for convenience, though they were largely or entirely under the direct control of General-Staff Sections at my headquarters.

COORDINATION OF SUPPLY AT THE FRONT.

2. Our successful participation in the war required that all the different services immediately concerned with the supply of combat troops should work together as a well-regulated machine. In other words, there must be no duplication of effort, but each must perform its functions without interference with any other service. The Fourth Section of the General Staff was created to control impartially all these services, and, under broad lines of policy, to determine questions of transportation and supply in France and coordinate our supply services with those of the Allies.

This section did not work out technical details but was charged with having a general knowledge of existing conditions as to supply, its transportation, and of construction affecting our operations or the efficiency of our forces. It frequently happened that several of the supply departments desired the same site for the location of installations, so that all plans for such facilities had to be decided in accordance with the best interests of the whole.

3. In front of the advance depots, railroad lines and shipments to troops had to be carefully controlled, because mobility demanded that combat units should not be burdened with a single day's stores above the authorized standard reserve. Furthermore, accumulations at the front were exposed to the danger of destruction or capture and might indicate our intentions. Each combat division required the equivalent of 25 French railway car loads of supplies for its daily consumption to be delivered at a point within reach of motor or horse-drawn transportation. The regular and prompt receipt of supplies by combatant troops is of first importance in its effect upon the morale of both officers and men. The officer whose mind is pre-occupied by the question of food, clothing, or ammunition, is not free to devote his energy to training his men or to fighting the enemy. It is necessary that paper work be reduced to an absolute

minimum and that the delivery of supplies to organizations be placed on an automatic basis as far as possible.

4. The principle of flexibility had to be borne in mind in planning our supply system in order that our forces should be supplied, no matter what their number, or where they might be called upon to enter the line. This high degree of elasticity and adaptability was assured and maintained through the medium of the regulating station. It was the connecting link between the armies and the services in the rear, and regulated the railroad transportation which tied them together. The regulating officer at each such station was a member of the Fourth Section of my General Staff, acting under instructions from his chief of section.

Upon the regulating officer fell the responsibility that a steady flow of supply was maintained. He must meet emergency shipments of ammunition or engineering material, sudden transfers of troops by rail, the hastening forward of replacements, or the unexpected evacuation of wounded. All the supply services naturally clamored to have their shipments rushed through. The regulating officer, acting under special or secret instructions, must declare priorities in the supply of things the Army needed most. Always informed of the conditions at the front, of the status of supplies, and of military plans and intentions, nothing could be shipped to the regulating station or in front of the advance depots except on his orders. The chiefs of supply services fulfilled their responsibilities when they delivered to the regulating officer the supplies called for by him, and he met his obligation when these supplies were delivered at the proper railheads at the time they were needed. The evacuation of the wounded was effected over the same railroad lines as those carrying supplies to the front, therefore, this control had also to be centralized in the regulating officer.

The convenient location of the regulating stations was of prime importance. They had to be close enough to all points in their zones to permit trains leaving after dusk or during the night to arrive at their destinations by dawn. They must also be far enough to the rear to be reasonably safe from capture. Only two regulating stations were actually constructed by us in France, Is-sur-Tille and Liffol-le-Grand, as the existing French facilities were sufficient to meet our requirements beyond the reach of those stations.

As far as the regulating officer was concerned, supplies were divided into four main classes. The first class constituted food, forage and fuel, needed and consumed every day; the second, uniforms, shoes, blankets and horse shoes, which wear out with reasonable regularity; the third, articles of equipment which require replacement at irregular intervals, such as rolling kitchens, rifles and escort

wagons; the fourth class covered articles, the flow of which depended upon tactical operations, such as ammunition and construction material. Articles in the first class were placed on an automatic basis, but formal requisition was eliminated as far as possible for all classes.

5. In order to meet many of the immediate needs of troops coming out of the line and to relieve to some extent the great strain on the railheads during active fighting, a system of army depots was organized. These depots were supplied by bulk shipments from the advance depots through the regulating stations during relatively quiet periods. They were under the control of the chiefs of the supply services of the armies and required practically no construction work, the supplies being stored in open places protected only by dunnage and camouflaged tarpaulins.

6. The accompanying diagram illustrates graphically the supply system which supported our armies in France. The Services of Supply can be likened to a great reservoir divided into three main parts—the base depots, the intermediate depots and the advance depots. The management of this reservoir is in charge of the commanding general, Services of Supply, who administers it with a free hand, controlled only by general policies outlined to him from time to time. Each of the supply and technical services functions independently in its own respective sphere; each has its share of storage space in the base depots, in the intermediate depots, and in the advance depots. Then comes the distribution system, and here the control passes to the chief of the Fourth Section of the General Staff, who exercises his powers through the regulating stations.

PURCHASING AGENCY.

7. The consideration of requirements in food and material led to the adoption of an automatic supply system, but, with the exception of foodstuffs, there was an actual shortage, especially in the early part of the war, of many things, such as equipment pertaining to land transportation and equipment and material for combat. The lack of ocean tonnage to carry construction material and animals at the beginning was serious. Although an increasing amount of shipping became available as the war progressed, at no time was there sufficient for our requirements. The tonnage from the States reached about seven and one-half million tons to December 31, 1918, which was a little less than one-half of the total amount obtained.

The supply situation made it imperative that we utilize European resources as far as possible for the purchase of material and supplies. If our Services of Supply departments had entered the market of

Europe as purchasers without regulation or coordination, they would have been thrown into competition with each other, as well as with buyers from the Allied armies and the civil populations. Such a system would have created an unnatural elevation of prices, and would have actually obstructed the procurement of supplies. To meet this problem from the standpoint of economical business management, directions were given in August, 1917, for the creation of a General Purchasing Board to coordinate and control our purchases both among our own services and among the Allies as well. The supervision and direction of this agency was placed in the hands of an experienced business man, and every supply department in the American Expeditionary Forces was represented on the board. Agents were stationed in Switzerland, Spain, and Holland, besides the Allied countries. The character of supplies included practically the entire category of necessities, although the bulk of our purchases consisted of raw materials for construction, ordnance, air equipment, and animals. A total of about 10,000,000 tons was purchased abroad by this agency to December 31, 1918, most of which was obtained in France.

The functions of the Purchasing Agency were gradually extended until they included a wide field of activities. In addition to the coordination of purchases, the supply resources of our Allies were reconnoitered and intimate touch was secured with foreign agencies; a Statistical Bureau was created which classified and analyzed our requirements; quarterly forecasts of supplies were issued; civilian manual labor was procured and organized; a Technical Board undertook the coordination, development, and utilization of the electric power facilities in France; a Bureau of Reciprocal Supplies viséed the claims of foreign governments for raw materials from the United States; and a general printing plant was established. Some of these activities were later transferred to other services as the latter became ready to undertake their control.

The principles upon which the usefulness of this agency depended were extended to our Allies, and in the summer of 1918 the General Purchasing Agent became a member of the Interallied Board of Supplies. This Board undertook, with signal success, to coordinate the supply of the Allied armies in all those classes of material necessities that were in common use in all the armies. The possibility of immense savings were fully demonstrated, but the principles had not become of general application before the Armistice.

OCEAN TONNAGE.

8. Following a study of tonnage requirements, an officer was sent to Washington in December, 1917, with a general statement of the

shipping situation in France as understood by the Allied Maritime Council. In March, 1918, tonnage requirements for transport and maintenance of 900,000 men in France by June 30 were adopted as a basis upon which to calculate supply requisitions and the allocation of tonnage.

In April the Allied Maritime Transport Council showed that requirements for 1918 greatly exceeded the available tonnage. Further revisions of the schedule were required by the Abbeville Agreement in May, under which American infantry and machine gun units were to be transported in British shipping, and by the Versailles Agreement in June.

In July, a serious crisis developed as the allotment for August made the American Expeditionary Forces by the Shipping Control Committee was only 575,000 dead-weight tons, afterwards increased to 700,000, whereas 803,000 tons (not including animals) were actually needed. It was strongly urged by me that more shipping be diverted from trades and that a larger percentage of new shipping be placed in transport service.

9. Early in 1918, a scheme had been proposed which would provide priority for essential supplies only, based upon monthly available tonnage in sight. Although it was the understanding that calls for shipping should be based upon our actual needs, much irregularity was found in tonnage allotments, as shown by the following cables sent September 14, 1918.

"The following variations from cable orders are noticeable:

Q. M. supplies cabled for, for August delivery, 182,287 short tons.

Q. M. supplies actually received during August, 231,850 short tons.

T. D. supplies (rolling stock, etc.) called for, for August delivery, 113,482 short tons.

T. D. supplies actually received during August, 67,521 short tons."

"You must prepare to ship supplies we request, instead of shipping excessive amounts of supplies of which we have a due proportion."

"An increase in the allotment of tonnage must be made, even for September. It is imperative. I can not too strongly urge that the allotment be reconsidered in the light of the above showing of our deficiencies. * * *" "At the present time our ability to supply and maneuver our forces depends largely on motor transportation * * *. We are able to carry out present plans due to fact that we have been able to borrow temporarily large numbers of trucks and ambulances from the French * * *. The shortage of ambulances to move our wounded is critical * * *. We have reached the point where we can no longer improvise or borrow. The most important plans and operations depend upon certainty that the home Government will deliver at French ports material and equipment cabled for. It is urged that foregoing be given most serious consideration and that tonnage allotted for supply of Army in France be sufficient to deliver material and equipment, properly proportioned in kinds and amount, to meet the needs of our troops * * *."

The following is a brief summary of the tonnage asked for and the amount actually received in France during the critical period from July to October, 1918:

Month.	Cabled for by American Ex- peditionary Forces.	Received in France from United States.	Shortage.
July.....	¹ 480,891	438,047	42,844
August.....	700,527	511,261	189,266
September.....	869,438	539,018	330,420
October.....	1,022,135	623,689	398,446
Total.....	3,072,991	2,112,015	960,976

¹ Tons of 2,000 pounds.

REPLACEMENTS OF PERSONNEL.

10. Under the original organization project there were to be two divisions in each corps of six divisions which were to be used as reservoirs of replacements. One half of the Artillery and other auxiliaries of these two divisions were to be utilized as corps and army troops. They were to supply the first demands for replacements from their original strength, after which a minimum of 3,000 men per month for each army corps in France was to be forwarded to them from the United States. It was estimated that this would give a sufficient reservoir of personnel to maintain the fighting strength of combat units, provided the sick and wounded were promptly returned to their own units upon recovery.

The Thirty-second and Forty-first Divisions were the first to be designated as replacement and depot divisions of the First Army Corps, but the situation soon became such that the Thirty-second Division had to be employed as a combat division. For the same reason all succeeding divisions had to be trained for combat, until June 27, when the need for replacements made it necessary to designate the Eighty-third as a depot division.

11. By the middle of August we faced a serious shortage of replacements. Divisions had arrived in France below strength, and each division diverted from replacement to combat duty increased the number of divisions to be supplied and at the same time decreased the supply.

On August 16 the War Department was cabled, as follows:

"Attention is especially invited to the very great shortage in arrivals of replacements heretofore requested. Situation with reference to replacements is now very acute. Until sufficient replacements are available in France to keep our proven divisions at full strength, replacements should by all means be sent in preference to new divisions."

At this time it became necessary to transfer 2,000 men from each of three combat divisions (the Seventh, Thirty-sixth, and Eighty-first) to the First Army, in preparation for the St. Mihiel offensive.

By the time the Meuse-Argonne offensive was initiated the replacement situation had become still more acute. The Infantry and Machine gun units of the Eighty-fourth and Eighty-sixth Divisions, then in the vicinity of Bordeaux, were utilized as replacements, leaving only a cadre of two officers and twenty-five men for each company. To provide immediate replacements during the progress of the battles new replacement organizations were formed in the Zone of Operations; at first, as battalions, and later, as regional replacement depots.

12. On October 3, a cable was sent the War Department, reading as follows:

"Over 50,000 of the replacements requested for the months of July, August, and September have not yet arrived. Due to extreme seriousness of the replacement situation, it is necessary to utilize personnel of the Eighty-fourth and Eighty-sixth Divisions for replacement purposes. Combat divisions are short over 80,000 men. Vitally important that all replacements due, including 55,000 requested for October, be shipped early in October. If necessary, some divisions in United States should be stripped of trained men and such men shipped as replacements at once."

Altogether seven divisions had to be skeletonized, leaving only one man per company and one officer per regiment to care for the records. As a further measure to meet the situation, the authorized strength of divisions was reduced in October by 4,000 men, thus lowering the strength of each Infantry company to approximately 174 men. The 30 combat divisions in France at that time needed 103,513 Infantry and machine gun replacements, and only 66,490 were available.

Attention of the War Department was invited on November 2 to the fact that a total of 140,000 replacements would be due by the end of November, and the cable closed by saying:

"To send over entire divisions, which must be broken up on their arrival in France so we may obtain replacements that have not been sent as called for, is a wasteful method, and one that makes for inefficiency; but as replacements are not otherwise available, there is no other course open to us. New and only partially trained divisions can not take the place of older divisions that have had battle experience. The latter must be kept up numerically to the point of efficiency * * *."

REMOUNTS.

13. The shortage of animals was a serious problem throughout the war. In July, 1917, the French agreed to furnish our forces with 7,000 animals a month, and accordingly the War Department was requested to discontinue shipments. On August 24, however, the French advised us that it would be impossible to furnish the number of animals originally stated, and Washington was again asked to supply animals, but none could be sent over until November, and then only a limited number.

Early in 1918, after personal intervention and much delay, the French Government made requisition on the country, and we were able to obtain 50,000 animals. After many difficulties, the Purchasing Board was successful in obtaining permission, in the summer of 1918, to export animals from Spain, but practically no animals were received until after the Armistice.

Every effort was made to reduce animal requirements—by increased motorization of artillery and by requiring mounted officers and men to walk—but in spite of all these efforts, the situation as to animals grew steadily worse. The shortage by November exceeded 106,000, or almost one-half of all our needs. To relieve the crisis in this regard, during the Meuse-Argonne battle, Marshal Foch requisitioned 13,000 animals from the French Armies and placed them at my disposal.

RECLASSIFICATION OF PERSONNEL.

14. An important development in the Services of Supply was the reclassification system for officers and men. This involved not only the physical reclassification of those partially fit for duty, but also the reclassification of officers according to fitness for special duties. A number of officers were found unfit for combat duty, and many in noncombatant positions were found unsuited to the duties on which employed. An effort was made to reassign these officers to the advantage of themselves and the Army. A total of 1,101 officers were reclassified in addition to the disabled, and 270 were sent before efficiency boards for elimination. 962 wounded or otherwise disabled officers were reclassified, their services being utilized to release officers on duty with the Services of Supply who were able to serve with combat units.

CONSTRUCTION BY ENGINEER CORPS.

15. Among the most notable achievements of the American Expeditionary Forces was the large program of construction carried out by our Engineer troops in the Services of Supply and elsewhere. The chief projects were port facilities including docks, railroads, warehouses, hospitals, barracks, and stables. These were planned to provide ultimately for an army of 4,000,000 men, the construction being carried on coincident with the growth of the American Expeditionary Forces.

The port plans contemplated 160 new berths, including the necessary facilities for discharge of cargo, approximately one-half of which were completed at the time of the Armistice. Construction of new standard-gauge railroad track amounted to 1,002 miles, consisting mainly of cut-offs, double tracking at congested points, and yards at ports and depots. Road construction and repair continued

until our troops were withdrawn from the several areas, employing at times upward of 10,000 men, and often using 90,000 tons of stone per week.

Storage requirements necessitated large supply depots at the ports and in the intermediate and advance sections. Over 2,000,000 square feet of covered storage was secured from the French, but it was necessary to construct approximately 20,000,000 square feet additional. The base hospital centers at Mars and Mesves, each with 4,000-bed convalescent camps, are typical of the large scale upon which hospital accommodations were provided. The hospital city at Mars, of 700 buildings, covered a ground space of 33 acres and included the usual road, water, sewerage, and lighting facilities of a municipality.

16. Advantages of economy and increased mobility caused the adoption of the system of billeting troops. Billeting areas were chosen near the base ports, along the line of communications, and in the advanced zone, as strategical requirements dictated. The system was not altogether satisfactory, but with the number of troops to be accommodated no other plan was practicable. Demountable barracks were used for shelter to supplement lack of billets, 16,000 barracks of this type being erected, particularly at base ports where large camps were necessary. Stables at remount stations were built for 43,000 animals. Other construction included refrigerating plants, such as the one at Gievres with a capacity of 6,500 tons of meat and 500 tons of ice per day; and mechanical bakeries like that at Is-sur-Tille with capacity of 800,000 pounds of bread per day. If the buildings constructed were consolidated, with the width of a standard barrack, they would reach from St. Nazaire across France to the Elbe River in Germany, a distance of 730 miles.

In connection with construction work, the Engineer Corps engaged in extensive forestry operations, producing 200,000,000 feet of lumber, 4,000,000 railroad ties, 300,000 cords of fuel wood, 35,000 pieces of piling, and large quantities of miscellaneous products.

TRANSPORTATION CORPS.

17. The Transportation Corps as a separate organization was new to our Army. Its exact relation to the supply departments was conceived to be that of a system acting as a common carrier operating its own ship and rail terminals. The equipment and operation of port terminals stands out as a most remarkable achievement. The amount of tonnage handled at all French ports grew slowly, reaching about 17,000 tons daily at the end of July, 1918. An emergency then developed as a result of the critical military situation, and the capacity of our terminals was so efficiently increased that, by November 11, 45,000 tons were being handled daily.

The French railroads, both in management and material, had dangerously deteriorated during the war. As our system was superimposed upon that of the French it was necessary to provide them with additional personnel and much matériel. Experienced American railroad men brought into our organization, in various practical capacities, the best talent in the country, who, in addition to the management of our own transportation, materially aided the French. The relation of our Transportation Corps to the French railroads and to our own supply departments presented many difficulties, but these were eventually overcome and a high state of efficiency established.

18. It was early decided, as expedient for our purposes, to use American rolling stock on the French railroads, and approximately 20,000 cars and 1,500 standard-gauge locomotives were brought from the United States and assembled by our railroad troops. We assisted the French by repairing with our own personnel 57,385 French cars, and 1,947 French locomotives. The lack of rolling stock for Allied use was at all times a serious handicap, so that the number of cars and locomotives built and repaired by us was no small part of our contribution to the Allied cause.

QUARTERMASTER CORPS.

19. The Quartermaster Corps was able to provide a larger tonnage of supplies from the States than any of the great supply departments. The operations of this corps were so large and the activities so numerous that they can best be understood by a study of the report of the commanding general Services of Supply.

The Quartermaster Corps in France was called upon to meet conditions never before presented, and it was found advisable to give it relief. Transportation problems by sea transport and by rail were handled by separate corps organized for that purpose, and already described. Motor transport was also placed under an organization of its own. The usual routine supplies furnished by this department reached enormous proportions. Except for the delay early in 1918 in obtaining clothing and the inferior quality of some that was furnished, and an occasional shortage in forage, no army was ever better provided for. Special services created under the Quartermaster Corps included a Remount Service, which received, cared for, and supplied animals to troops; a Veterinary Service, working in conjunction with the remount organization; an Effects Section and Baggage Service; and a Salvage Service for the recovery and preparation for reissue of every possible article of personal equipment. Due to the activities of the Salvage Service, an estimated saving of \$85,000,000 was realized, tonnage and raw material were

conserved, and what in former wars represented a distinct liability was turned into a valuable asset.

The Graves Registration Service, also under the Quartermaster Corps, was charged with the acquisition and care of cemeteries, the identification and reburial of our dead, and the correspondence with relatives of the deceased. Central cemeteries were organized on the American battle fields, the largest being at Romagne-sous-Montfaucon and at Thiaucourt in the Woevre. All territory over which our troops fought was examined by this service, and, generally speaking, the remains of our dead were assembled in American cemeteries and the graves marked with a cross or six-pointed star and photographed. A few bodies were buried where they fell or in neighboring French or British cemeteries. Wherever the soldier was buried, his identification tag, giving his name and Army serial number, was fastened to the marker. A careful record was kept of the location of each grave.

SIGNAL CORPS.

20. The Signal Corps supplied, installed, and operated the general service of telephone and telegraphic communications throughout the Zone of the Armies, and from there to the rear areas. At the front it handled radio, press, and intercept stations; provided a radio network in the Zone of Advance; and also managed the meteorological, pigeon, and general photographic services. Our communication system included a cable across the English Channel, the erection of 4,000 kilometers of telephone and telegraph lines on our own poles, and the successful operation of a system with 215,500 kilometers of lines.

MOTOR TRANSPORT CORPS.

21. The quantity and importance of gasoline-engine transportation in this war necessitated the creation of a new service known as the Motor Transport Corps. It was responsible for setting up motor vehicles received from America, their distribution, repair, and maintenance. Within the zone of the Services of Supply, the Motor Transport Corps controlled the use of motor vehicles, and it gave technical supervision to their operation in the Zone of the Armies. It was responsible for the training and instruction of chauffeurs and other technical personnel. Due to the shortage of shipments from America, a large number of trucks, automobiles, and spare parts had to be purchased in France.

RENTING, REQUISITION, AND CLAIMS SERVICE.

22. A Renting, Requisition, and Claims Service was organized in March, 1918, to procure billeting areas, supervise the quartering of

troops with an organization of zone and town majors, and to have charge of the renting, leasing, and requisitioning of all lands and buildings required by the American Expeditionary Forces. Under the provisions of an act of Congress, approved in April, 1918, the Claims Department was charged with the investigation, assessment, and settlement of all claims "of inhabitants of France or any other European country not an enemy or ally of an enemy" for injuries to persons or damages to property occasioned by our forces. The procedure followed was in accordance with the law and practice of the country in question. The efficient administration of this service had an excellent effect upon the people of the European countries concerned.

23. The various activities of the Services of Supply which, at its height on November 11, 1918, reached a numerical strength in personnel of 668,312, including 23,772 civilian employees, can best be summed up by quoting the telegram sent by me to Maj. Gen. James G. Harbord, the Commanding General, Services of Supply, upon my relinquishing personal command of the First Army:

"I want the S. O. S. to know how much the First Army appreciated the prompt response made to every demand for men, equipment, supplies, and transportation necessary to carry out the recent operations. Hearty congratulations. The S. O. S. shares the success with it."

MUNITIONS.

ORDNANCE.

24. Our entry into the war found us with few of the auxiliaries necessary for its conduct in the modern sense. The task of the Ordnance Department in supplying artillery was especially difficult. In order to meet our requirements as rapidly as possible, we accepted the offer of the French Government to supply us with the artillery equipment of 75's, 155 mm. howitzers and 155 G. P. F. guns from their own factories for 30 divisions. The wisdom of this course was fully demonstrated by the fact that, although we soon began the manufacture of these classes of guns at home, there were no guns of American manufacture of the calibres mentioned on our front at the date of the armistice. The only guns of these types produced at home which reached France before the cessation of hostilities were one hundred and nine 75 mm. guns. In addition, twenty-four 8-inch howitzers from the United States reached our front and were in use when the Armistice was signed. Eight 14-inch naval guns of American manufacture were set up on railroad mounts, and most of these were successfully employed on the Meuse-Argonne front under the efficient direction of Admiral Plunkett of the Navy.

AVIATION.

25. In aviation we were entirely dependent upon our Allies, and here again the French Government came to our aid until our own program could be set under way. From time to time we obtained from the French such planes for training personnel as they could provide. Without going into a complete discussion of aviation matériel, it will be sufficient to state that it was with great difficulty that we obtained equipment even for training. As for up-to-date combat planes, the development at home was slow, and we had to rely upon the French who provided us with a total of 2,676 pursuit, observation, and bombing machines. The first aeroplanes received from home arrived in May, and altogether we received 1,379 planes of the De Havilland type. The first American squadron completely equipped by American production, including aeroplanes, crossed the German lines on August 7, 1918. As to our aviators, many of whom trained with our Allies, it can be said that they had no superiors in daring and in fighting ability. During the battles of St. Mihiel and Meuse-Argonne our aviators excelled all others. They have left a record of courageous deeds that will ever remain a brilliant page in the annals of our Army.

TANKS.

26. In the matter of tanks, we were compelled to rely upon both the French and the English. Here, however, we were less fortunate for the reason that our Allies barely had sufficient tanks to meet their own requirements. While our Tank Corps had limited opportunity, its fine personnel responded gallantly on every possible occasion and showed courage of the highest order. We had one battalion of heavy tanks engaged on the English front. On our own front we had only the light tanks, and the number available to participate in the last great assault of November 1 was reduced to 16 as a result of the previous hard fighting in the Meuse-Argonne.

CHEMICAL WARFARE SERVICE.

27. The Chemical Warfare Service represented another entirely new departure in this war. It included many specialists from civil life. With personnel of a high order, it developed rapidly into one of our most efficient auxiliary services. While the early employment of gas was in the form of clouds launched from special projectors, its use later on in the war was virtually by means of gas shells fired by the light artillery. One of the most important duties of the Chemical Warfare Service was to insure the equipment of our troops with a safe and comfortable mask, and the instruction of the personnel in the use of this protector. Whether or

not gas will be employed in future wars is a matter of conjecture, but the effect is so deadly to the unprepared that we can never afford to neglect the question.

ADMINISTRATION.

MEDICAL AND SANITARY CONDITIONS.

28. The general health of our armies under conditions strange and adverse in many ways to our American experience and mode of life was marvelously good. The proportionate number of men incapacitated from other causes than battle casualties and injuries was low. Of all deaths in the American Expeditionary Forces (to September 1, 1919) totaling 81,141, there were killed in action, 35,556; died of wounds received in battle, 15,130; other wounds and injuries, 5,669; and died of disease, 24,786. Therefore, but little over two-sevenths the total loss of life in the American Expeditionary Forces was caused by disease.

Our armies suffered from the communicable diseases that usually affect troops. Only two diseases have caused temporarily excessive sick rates, epidemic diarrhea and influenza, and of these influenza only, due to the fatal complicating pneumonia, caused a serious rise in the death rate. Both prevailed in the armies of our Allies and enemies and in the civilian population of Europe.

Venereal disease has been with us always, but the control was successful to a degree never before attained in our armies, or in any other army. It has been truly remarkable when the environment in which our men lived is appreciated. The incidence of venereal disease varied between 30 and 60 per thousand per annum, averaging under 40. Up to September, 1919, all troops sent home were free from venereal disease. The low percentage was due largely to the fine character of men composing our armies.

29. Hospitalization represented one of the largest and most difficult of the medical problems in the American Expeditionary Forces. That the needs were always met and that there was always a surplus of several thousand beds, were the results of great effort and the use of all possible expedients to make the utmost of resources available. The maximum number of patients in hospital on any one day was 193,026, on November 12, 1918.

Evacuation of the sick and wounded was another difficult problem, especially during the battle periods. The total number of men evacuated in the Zone of the Armies was 214,467, of whom 11,281 were sent in hospital trains to base ports. The number of sick and wounded sent to the United States up to November 11, 1918, was 14,000. Since the Armistice, 103,028 patients have been sent to the United States.

30. The Army and the Medical Department were fortunate in obtaining the services of leading physicians, surgeons, and specialists in all branches of medicine from all parts of the United States, who brought the most skillful talent of the world to the relief of our sick and wounded. The Army Nurse Corps deserves more than passing comment. These women, working tirelessly and devotedly, shared the burden of the day to the fullest extent with the men, many of them submitting to all the dangers of the battle front.

RECORDS, PERSONNEL, AND MAIL SERVICE.

31. New problems confronted the Adjutant General's Department in France. Our great distance from home necessitated records, data, and executive machinery to represent the War Department as well as our forces in France. Unusually close attention was paid to individual records. Never before have accuracy and completeness of reports been so strictly insisted upon. Expedients had to be adopted whereby the above requirements could be met without increasing the record and correspondence work of combat units. The organization had to be elastic to meet the demands of any force maintained in Europe.

A Statistical Division was organized to collect data regarding the special qualifications of all officers and to keep an up-to-date record of the location, duties, health, and status of every officer and soldier, nurse, field clerk, and civilian employee, as well as the location and strength of organizations. The Central Records Office at Bourges received reports from the battle front, evacuation and base hospitals, convalescent-leave areas, reclassification camps, and base ports, and prepared for transmission to the War Department reports of individual casualties. Each of the 299,599 casualties was considered as an individual case. A thorough investigation of the men classed as "missing in action" reduced the number from 14,000 at the signing of the Armistice to 22 on August 31, 1919.

32. In addition to printing and distributing all orders from General Headquarters, the Adjutant General's Department had charge of the delivery and collection of official mail and finally of all mail. The Motor Dispatch Service operated 20 courier routes, over 2,300 miles of road, for the quick dispatch and delivery of official communications. After July 1, 1918, the Military Postal Express Service was organized to handle all mail, official and personal, and operated 169 fixed and mobile post offices and a railway post-office service.

While every effort was exerted to maintain a satisfactory mail service, frequent transfers of individuals, especially during the hurried skeletonizing of certain combat divisions, numerous errors in

addresses, hasty handling, and readdressing of mail by regimental and company clerks in the Zone of Operations, and other conditions incident to the continuous movement of troops in battle, made the distribution of mail an exceedingly difficult problem. -

INSPECTION—DISCIPLINE.

33. The Inspector General's Department, acting as an independent agency not responsible for the matters under its observation, made inspections and special investigations for the purpose of keeping commanders informed of local conditions. The inspectors worked unceasingly to determine the manner in which orders were being carried out, in an effort to perfect discipline and team play.

The earnest belief of every member of the Expeditionary Forces in the justice of our cause was productive of a form of self-imposed discipline among our soldiers which must be regarded as an unusual development of this war, a fact which materially aided us to organize and employ in an incredibly short space of time the extraordinary fighting machine developed in France.

Our troops generally were strongly imbued with an offensive spirit essential to success. The veteran divisions had acquired not only this spirit, but the other elements of fine discipline. In highly trained divisions, commanders of all grades operate according to a definite system calculated to concentrate their efforts where the enemy is weakest. Straggling is practically eliminated; the Infantry, skillful in fire action and the employment of cover, gains with a minimum of casualties; the battalion, with all of its accompanying weapons, works smoothly as a team in which the parts automatically assist each other; the Artillery gives the Infantry close and continuous support; and unforeseen situations are met by prompt and energetic action.

This war has only confirmed the lessons of the past. The less experienced divisions, while aggressive, were lacking in the ready skill of habit. They were capable of powerful blows, but their blows were apt to be awkward—teamwork was often not well understood. Flexible and resourceful divisions can not be created by a few maneuvers or by a few months' association of their elements. On the other hand, without the keen intelligence, the endurance, the willingness, and enthusiasm displayed in the training area, as well as on the battle field, the successful results we obtained so quickly would have been utterly impossible.

MILITARY JUSTICE.

34. The commanders of armies, corps, divisions, separate brigades, and certain territorial districts, were empowered to appoint general courts-martial. Each of these commanders had on his staff an officer

of the Judge Advocate General's Department, whose duty it was to render legal advice and to assist in the prompt trial and just punishment of those guilty of serious infractions of discipline.

Prior to the signing of the Armistice, serious breaches of discipline were rare, considering the number of troops. This was due to the high sense of duty of the soldiers and their appreciation of the seriousness of the situation. In the period of relaxation following the cessation of hostilities, infractions of discipline were naturally more numerous, but not even then was the number of trials as great in proportion to the strength of the force as is usual in our service.

35. It was early realized that many of the peace-time methods of punishment were not the best for existing conditions. In the early part of 1918, it was decided that the award of dishonorable discharge of soldiers convicted of an offense involving moral turpitude, would not be contemplated, except in the most serious cases. To remove these soldiers temporarily from their organizations, division commanders were authorized to form provisional temporary detachments to which such soldiers could be attached. These detachments were retained with their battalions so that offenders would not escape the dangers and hardships to which their comrades were subjected. Wherever their battalion was engaged, whether in front-line trenches or in back areas, these men were required to perform hard labor. Only in emergency were they permitted to engage in combat. Soldiers in these disciplinary battalions were made to understand that if they acquitted themselves well, they would be restored to full duty with their organizations.

All officers exercising disciplinary powers were imbued with the purpose of these instructions and carried them into effect. So that nearly all men convicted of military offenses in combat divisions remained with their organizations and continued to perform their duty as soldiers. Many redeemed themselves by rendering valiant service in action and were released from the further operation of their sentences.

36. To have the necessary deterrent effect upon the whole unit, courts-martial for serious offenses usually imposed sentences considerably heavier than would have been awarded in peace times. Except where the offender earned remission at the front, these sentences stood during hostilities. At the signing of the Armistice, steps were at once taken to reduce outstanding sentences to the standards of peace time.

PROVOST MARSHAL GENERAL'S DEPARTMENT.

37. On July 20, 1917, a Provost Marshal General was appointed with station in Paris, and later the department was organized as an administrative service with the Provost Marshal General func-

tioning under the First Section, General Staff. The Department was developed into four main sections—the Military Police Corps which served with divisions, corps, and armies and in the sections of the Services of Supply; the Prisoner of War Escort Companies; the Criminal Investigation Department; and the Circulation Department. It was not until 1918 that the last-mentioned department became well trained and efficient. On October 15, 1918, the strength of the Corps was increased to 1 per cent of the strength of the American Expeditionary Forces, and provost marshals for armies, corps, and divisions were provided.

The military police of the American Expeditionary Forces developed into one of the most striking bodies of men in Europe. Wherever the American soldier went, there our military police were on duty. They controlled traffic in the battle zone, in all villages occupied by American troops, and in many cities through which our traffic flowed; they maintained order, so far as the American soldiers were concerned, throughout France and in portions of England, Italy, Belgium, and occupied Germany. Their smart appearance and military bearing and the intelligent manner in which they discharged their duties left an excellent impression of the typical American on all with whom they came in contact.

PART IV.

MISCELLANEOUS SUBJECTS.

PRISONERS OF WAR.

1. All prisoners taken by the American troops were kept at least 30 kilometers behind our lines under guard by the Provost Marshal General's Department, except wounded or sick prisoners who were immediately sent to hospitals for treatment. Arrangements were made with the French and British that prisoners taken by our units operating with them should be sent to American enclosures. The Provost Marshal General was instructed to follow the principles of The Hague and the Geneva conventions in the treatment of prisoners, although these were not recognized by the United States as binding in the present war. Prisoners were organized into labor companies, and were employed on work which had no distinct bearing on military operations. The officer prisoners of war were accorded the same treatment as received by American officers confined in Germany. A Prisoner of War Information Bureau was established in the Central Records Office. Under a mutual understanding with the German Government, payments were made to prisoners in the form of credits, and, subject to censorship, they were allowed to send and receive letters and packages. Religious meetings were held by prisoner chaplains, assisted by our Army chaplains and welfare workers.

2. From June, 1918, to the end of March, 1919, a total of 48,280 enemy prisoners were handled by the Provost Marshal General's Department, of whom 93 died and 73 escaped and were not recaptured. At the request of the French Government, 516 prisoners, natives of Alsace-Lorraine, were released after examination by a French commission. In accordance with the provisions of the Geneva convention, 59 medical officers and 1,783 men of the sanitary personnel, including 333 members of the German Red Cross, were repatriated. On April 9, 1919, we commenced to repatriate enemy prisoners who were permanently unfit for further military duty and those who could not perform useful labor.

3. Through the Berlin Red Cross and the International Red Cross at Geneva, an American Red Cross committee at Berne received lists of all American prisoners taken by the German troops, to each of whom, when located, was sent a package containing food, tobacco,

clean underclothing and toilet articles, and thereafter two packages a week. By a system of return post cards, it was determined that 85 per cent of these packages were received.

As soon as the Armistice was signed the Germans released large numbers of Allied prisoners who immediately started toward the Allied lines. Four American regional replacement departments were established, to which all returning Americans were sent until proper records could be made. Those in good physical condition were sent to their commands, while the others were sent to hospitals or to leave areas for a rest.

An Allied commission was formed in Berlin early in December, 1918, for the repatriation of Allied prisoners, with representatives from each of the American, British, French, and Italian Armies. American prisoners were evacuated through Switzerland in fully equipped trains, including hospital cars, provided by the Swiss Government and paid for by our Government. These were met by American trains at the Swiss border. It was planned to withdraw all our prisoners by this route, but a number had already been withdrawn through the northern ports and taken to England in British ships.

The Allied Commission obtained a statement of moneys paid Americans while in German prisons; investigated complaints concerning treatment of Americans; obtained possession of effects of prisoners who had died in captivity, or which had been left behind by those repatriated; and also located the graves of the American dead.

4. On November 11, 1918, there were 248 American officers and 3,302 men in the hands of the Germans, all of whom were evacuated by February 5, 1919. None of our prisoners were condemned to death, although 1 officer and 20 men died in captivity.

5. An Inter-Allied agreement on January 13, 1919, created a commission for the control of Russian prisoners in Germany. The British and American representatives, aided by small unarmed detachments, were charged with the administration of the Russian prison camps, and succeeded in discharging their duties despite the civil disorders in Germany.

Early in January, 1919, the Red Cross outlined a plan to send a commission to Germany to assist in caring for and feeding Russian prisoners, and an American officer was detailed to assist and accompany this commission. The Red Cross being financially unable to furnish the necessary food, arrangements were finally made with the French Government to furnish funds for its purchase from our Army stores, without any responsibility being assumed by the Army, as was desired by the Allied Food Commission. Such supplies as could be spared by the Army were sold to the French, and American officers were detailed to assist in their distribution. On April 10, 1919, the Supreme Allied War Council decided to give the German

Government complete freedom in repatriating Russian prisoners of war, stipulating only that none should be repatriated by force, and that all who left must be provided with sufficient food for the journey.

CIVIL ADMINISTRATION OF OCCUPIED TERRITORY.

6. To insure law and order, it was necessary that an American civil administration be created in the occupied territory. Different policies were adopted toward Luxemburg and occupied Germany, the former being a disarmed neutral and the latter occupied enemy territory. In both regions we issued proclamations defining our attitude toward the inhabitants.

In accordance with the precedent of our Government under similar circumstances, the local civil government remained in full possession of its former power, and retained jurisdiction over all civil matters. The organization of our civil administration in occupied territory provided for the control of civil affairs by the Officer in Charge of Civil Affairs in Occupied Territory, under whom Army, corps, and division commanders detailed suitable officers in local charge of civil matters. In the Grand Duchy of Luxemburg, civil affairs were regulated by a corresponding representative with an office in the city of Luxemburg.

7. The principle of requisitioning supplies was exercised extensively throughout the area, always under central control and without abuse of the privilege. Under a board of appraisal payment was made for all property requisitioned, the money being obtained from the German Government under the terms of the Armistice. Food and forage were not requisitioned, and during most of the period of occupation our officers and men were not allowed to purchase any German food and were forbidden to eat in the restaurants and cafés.

In Luxemburg, billeting arrangements and payment therefor were provided for by an agreement with the Government of Luxemburg.

Under instructions from the State Department, the interests of American citizens found in occupied Germany were referred to the American Embassy in Paris; in Luxemburg to the American Legation at The Hague.

8. We insisted upon the Germans maintaining all public utilities. After being inspected, measures were taken to assure priority of fuel supply in case of coal shortage due to strikes in the Ruhr and Saar districts or other causes. One of our chief problems was the maintenance and repair of roads and highways, and this at first necessitated the employment of soldier labor. As soon as possible a satisfactory system of road preservation and improvement was inaugurated, utilizing German civil labor.

To control and supervise the movement of funds and securities, all banks and banking houses were required to submit monthly reports. Trade and blockade regulations were controlled through the American Section of the Inter-Allied Economic Committee.

9. The Civil Administration issued instructions relative to courts. Army, corps, and divisional commanders were authorized to convene military commissions and appoint superior provost courts for their respective districts; and commanding officers of each city, town or canton, appointed an inferior provost court. All of these courts were for the trial of offenses against the laws of war or the Military Government. Our legal machinery was simple, and successful results in maintaining law and order were due to uniform and strict enforcement of such few regulations as proved necessary.

Strict censorship was maintained over postal, telephone and telegraphic communications. Passes and circulation were first handled by the Department of Civil Affairs, but on January 24, 1919, the Third Army took charge of those matters.

In connection with the reconstruction work in France and Belgium, the Department of Civil Affairs prepared a record of all recovered stolen property and measures were taken to protect it against deterioration or unauthorized removal.

10. The fraternization problem was sharply raised by the sudden transition from the rigors of war conditions in France to the comforts of undisturbed German cities and homes, but a realization by our troops of their position in enemy territory and of their duty to maintain the dignity of their own country reduced infractions of rules on the subject to a minimum.

EXECUTION OF ARMISTICE TERMS.

11. The first Armistice agreement provided for supervision by a Permanent International Armistice Commission to function under the authority of the Commander-in-Chief of the Allied Armies. The United States, Great Britain, Belgium, France, Italy and Germany were represented on the Permanent International Armistice Commission. The chairmen of this commission and of the five main committees were French. These committees were organized to care specifically for the work in connection with material, transportation, prisoners of war, entretien, and restitution. The United States was represented on each of these main committees.

12. The Germans unsuccessfully attempted to enter the Permanent International Armistice Commission on the basis of negotiation. Many adjustments were made because of the difficulties under which the German authorities were working, but, in general, they were held strictly to the spirit of the terms of the Armistice agreement.

Time of delivery was often extended, but penalties were imposed for failure to comply with the conditions. All aeroplanes were not obtained until a penalty was imposed of 20 horses for each undelivered plane. Evacuation of occupied territory, and repatriation of civilian inhabitants and of prisoners of war, were begun immediately and carried out promptly.

13. In the distribution among the Allied Armies of ordnance and aeroplanes surrendered by the enemy, the Belgian Army received one-tenth, American Army two-tenths, British Army three-tenths, and French Army four-tenths. Our share was 720 field guns, 534 heavy guns, 589 trench mortars, 10,356 machine guns and 340 aeroplanes. Railway rolling stock was divided according to the needs of the railway systems serving the different armies.

14. The question of expense of maintenance of the armies of occupation caused considerable discussion among the Allies and protests from the Germans. This was due to the diversity of opinion as to the items properly chargeable to the expense of an army of occupation. My policy was that, pending final settlement by the Peace Conference, Germany would be liable for all expenses of the American Army of Occupation; that any payments made by Germany for this purpose were to be considered as partial payments on account of the whole sum, and not as a liquidation of any specific expenses. Money was deposited in Coblenz banks to the credit of the United States, in amounts notified as necessary, to cover all expenditures made in the occupied area. The total expense as calculated by the different Allied Armies, before any of our troops were withdrawn, was based on the effective strength as shown by their Tables of Organization, and appears as follows:

Armies.	Officers.	Men.	Horses.	Cost per month in francs.
French.....	11,570	35,500	116,100	175,948,815.00
Belgian.....	1,834	39,430	11,600	30,195,142.60
British.....	12,000	240,000	70,000	127,935,000.00
United States.....	12,358	275,617	58,755	269,068,184.10
Total.....				603,147,141.70

UNITED STATES LIQUIDATION COMMISSION.

15. In February, 1919, upon my recommendation, the Secretary of War appointed the United States Liquidation Commission, War Department, which had charge of the liquidation of our affairs in France, the sale of our property and installations and the settlement of claims exclusive of those arising out of torts, which were handled by the Renting, Requisition and Claims Service. While not under my supervision, the Liquidation Commission played such an

important part in the closing chapter of our activities that some mention of it should be made in this report. With the dissolution of the American Expeditionary Forces we were confronted with the problem of disposing of large port and other installations and immense quantities of transportation, matériel, supplies and equipment. Much of this was of an immovable nature and the shipping situation forbade the transfer to the United States of most of the movable effects. There was little or no demand for many of the articles to be disposed of, and the expense of maintaining a force of caretakers until the market improved would have been prohibitive. The successful negotiations of the Commission led to the liquidation of our affairs with France by the payment of a lump sum to the United States by the French Government.

RELATIONS WITH THE ALLIES.

16. Our troops arrived in Europe after France and Great Britain had been fighting desperately for nearly three years, and their reception was remarkable in its cordiality. The resources of our Allies in men and material had been taxed to the limit, but they always stood ready to furnish us with needed supplies, equipment and transportation when at all available. We were given valuable assistance and cooperation in our training program by both the French and British armies, and when the shortage of labor personnel in our forces became acute the French Government rendered material assistance in the solution of this problem.

It was our good fortune to have a year in France to organize and train our forces. When our troops entered the battle the veteran soldiers of France and England gave them moral and physical support. The Artillery of our Allies often supported the advance of American troops; British and French tanks frequently cooperated with our Infantry; and their aviators fought in the air to assist the American soldier.

Throughout France our troops have been intimately associated with the French people, particularly the French peasant, and the relations growing out of these associations assure a permanent friendship between the two peoples. The small force of Americans serving in Italy was accorded a warm welcome and established with the Italian people the most friendly relations. The hospitable reception of those of our forces who passed through England has impressed upon us how closely common language and blood have brought together the British and ourselves.

The cooperation of our soldiers with the French, British, Belgians and Italians was decisive in bringing the war to a successful conclusion, and will have an equally decisive effect in welding to-

gether the bonds of sympathy and good will among the peoples of these nations and ourselves.

WELFARE WORK.

ALLIED FOOD COMMISSION.

17. At the request of the Allied Food Commission a selected personnel of 320 officers and 464 men was placed at the disposal of the Commission. There was no other American personnel in Europe or elsewhere available for this necessary work. Our officers were sent to various countries in charge of food distribution, and were everywhere received with the utmost friendliness. These officers and men, by their executive and administrative ability and their energetic resourcefulness, were in a large measure responsible for the manner in which these food supplies were delivered to the various peoples in central Europe during a period of civil unrest or complete disorder. By their disinterested conduct of this charitable work, they won for the American Army the admiration of the populations whom they served.

SOCIETIES.

18. In their respective spheres of activity the Red Cross and Y. M. C. A. undertook the burden of supplying the needs of the entire American Expeditionary Forces. Their efforts were in many respects limited by a lack of tonnage. But shortage in tonnage, transportation, or personnel, meant inability to carry out completely their appointed tasks; whereas with the smaller societies it meant inability to expand. In order to avoid duplication of effort, it was directed in August, 1917, that the Red Cross confine its activities to relief work, and the Y. M. C. A. to amusement and recreation. The Knights of Columbus and the Salvation Army were later given official recognition. The Y. W. C. A., Jewish Welfare Board and American Library Association conducted their activities through one of the established societies.

19. The American Red Cross maintained within our zones a system of "Line of Communication Canteens," which furnished refreshments and relief to troops in transit and became a valuable feature of the Red Cross work. The statistical work of the searchers attached to statistical sections and to hospitals obtained much information for relatives. This society also aided in locating American prisoners to whom it sent food from Switzerland.

20. To avoid depleting our personnel, the Y. M. C. A. agreed to operate our canteens and was at first allotted 208 ship-tons per 25,000 men per month to bring supplies from the United States, but the requirements of other services later made it necessary to reduce

this allotment to 100 tons. This materially reduced the valuable service the Y. M. C. A. might have rendered in this work. The termination of hostilities made it possible to relieve the society of this responsibility.

21. The need of greatly expanded welfare work after hostilities, such as athletics and education was at once recognized, and the co-operation of the welfare societies in all these activities was of inestimable value. Immediately after the Armistice steps were taken to provide diversion and entertainment for our troops. Entertainment officers were appointed in all units, and the Y. M. C. A. Entertainment Department furnished professionals and acted as a training and booking agency for soldier talent. Approximately 650 "soldier shows" were developed, which entertained hundreds of thousands of soldiers, who will remember this as one of the pleasant and unique enterprises of the American Expeditionary Forces.

The athletic program in the spring of 1919 culminated in the Inter-Allied games in June, held in the concrete stadium erected by our Engineers near Paris, the necessary funds being contributed by the Y. M. C. A. In number of participants and quality of entry, these games probably surpassed any of the past Olympic contests.

LEAVES AND LEAVE AREAS.

22. A leave system announced in general orders provided for a leave of seven days every four months, but it was necessary to suspend the privilege during active operations. In the leave-areas free board and lodging at first-class hotels were provided for soldiers, and the Y. M. C. A. furnished recreational and amusement facilities. A number of new areas were opened by the Services of Supply immediately after the Armistice, improved transportation accommodations were eventually secured, and arrangements were made whereby men could visit England, Belgium and Italy.

It was my desire that every man in the American Expeditionary Forces should be given an opportunity to visit Paris before returning to the United States, but the crowded condition of the city during the Peace Conference, transportation difficulties, and other reasons, made it necessary to limit the number of such leaves.

RELIGIOUS WORK.

23. Religious work in our Army before the war was carried on by chaplains, one to each regiment. To meet the greatly increased size of regiments, legislation was recommended by me to provide not less than one chaplain for each 1,200 men. Although such act was passed in June, 1918, there was a continuous shortage of chaplains with the fighting units and in the hospitals and camps in the rear areas.

This was largely met through the ready cooperation of the Welfare Societies who sent ministers and priests where most needed. Religious workers in the Y. M. C. A. and Knights of Columbus and Red Cross also aided in the work, the Red Cross sending chaplains to the States with units in many instances.

The religious work was directed and coordinated by a Board of Chaplains at general headquarters, of which Bishop Charles H. Brent was the head. With great devotion to duty this work was maintained despite a lack of transportation and other facilities. Chaplains, as never before, became the moral and spiritual leaders of their organizations, and established a high standard of active usefulness in religious work that made for patriotism, discipline and unselfish devotion to duty.

EDUCATIONAL WORK.

24. Prior to the Armistice, educational work was conducted through the organization of voluntary classes under the Y. M. C. A., the popular subjects studied being French language, French history, and the causes of the war. After the Armistice, measures were taken for a systematic organization of non-military educational training.

The formal school work began January 2nd, with post schools. Then divisional educational centers gave the equivalent of high-school instruction and specialized on vocational training. The American Expeditionary Forces University at Beaune carried on undergraduate and graduate work for the technical professions, while postgraduate work was provided by the entrance of our officers and soldiers into French and British universities. Special schools were organized to meet demands, such as the Practical Agricultural School at Allery and the Art Training Center at Paris, for painting, sculpture, architecture and interior decoration, advanced students being entered in the best ateliers of Paris. Active instruction was carried on in the base hospitals and convalescent camps.

An important branch of the educational work was the field institute of short courses and educational extension lectures, organized to meet conditions due to the rapid repatriation of our soldiers and the constant movement of troops. At least half of our forces were reached by this means with brief intensive courses in business, trades, engineering, agriculture, occupational guidance, and in citizenship.

25. On April 15 all educational work came under the complete control of the Training Section of the General Staff. The advantage of this change in management was at once apparent in the better coordination of the work of an excellent body of educators. The total attendance in the organized school system of the American Expeditionary Forces was 230,020, of which number 181,475 attended post schools, 27,250 educational centers, 8,528 the American

Expeditionary Forces University at Beaune, 367 Art Training Centers, 4,144 Mechanical Trade Schools, 6,300 French universities and 1,956 British universities. The attendance upon the institute short courses totaled 690,000 more, and at the extension lectures 750,000, giving a grand total of attendance at all educational formations of 1,670,020.

The educational work in the American Expeditionary Forces was of undoubted value, not only in improving morale, but in concrete benefit to the individual officer and soldier. It demonstrated satisfactorily that a combined military and educational program can be carried out in the Army with little detriment to pure military training and with decided advantage to the individual.

STARS AND STRIPES.

26. The Stars and Stripes was a weekly newspaper conceived with the idea of increasing the morale of American troops by providing a common means of voicing the thought of the entire American Expeditionary Forces. Edited and managed by enlisted men who declined promotion, preferring to remain in the ranks in order better to interpret the spirit of the Army, it was a great unifying force and materially aided in the development of an esprit de corps. It lent loyal and enthusiastic support to Army athletics and to the educational program. In leading the men of our Army to laugh at their hardships, it was a distinct force for good and helped to create a healthy viewpoint. The campaign it conducted for the benefit of French orphans resulted in a fund of 2,250,000 francs.

APPRECIATION.

27. In this brief summary of the achievements of the American Expeditionary Forces it would be impossible to cite in detail the splendid ability, loyalty and efficiency that characterized the service of both combatant and non-combatant individuals and organizations. The most striking quality of both officers and men was the resourceful energy and common sense employed, under all circumstances, in handling their problems.

The highest praise is due the commanders of armies, corps and divisions, and their subordinate leaders, who labored loyally and ably toward the accomplishment of our task, suppressing personal opinions and ambitions in the pursuit of the common aim; and to their staffs, who developed, with battle experience, into splendid teams without superiors in any army.

To my Chiefs of Staff, Maj. Gen. James G. Harbord, who was later placed in command of the Services of Supply, and Maj. Gen. James

W McAndrew, I am deeply indebted for highly efficient services in a post of great responsibility.

The important work of the staff at General Headquarters in organization and administration was characterized by exceptional ability and a fine spirit of cooperation. No chief ever had a more loyal and efficient body of assistants.

The officers and men of the Services of Supply fully realized the importance of their duties, and the operations of that vast business system were conducted in a manner which won for them the praise of all. They deserve their full share in the victory.

The American civilians in Europe, both in official and private life, were decidedly patriotic and loyal, and invariably lent encouragement and helpfulness to the armies abroad.

The various societies, especially their women, including those of the theatrical profession, and our Army nurses, played a most important part in brightening the lives of our troops and in giving aid and comfort to our sick and wounded.

The Navy in European waters, under command of Admiral Sims, at all times cordially aided the Army. To our sister service we owe the safe arrival of our armies and their supplies. It is most gratifying to record that there has never been such perfect understanding between these two branches of the service.

Our armies were conscious of the support and cooperation of all branches of the Government. Behind them stood the entire American people, whose ardent patriotism and sympathy inspired our troops with a deep sense of obligation, of loyalty, and of devotion to the country's cause never equaled in our history.

Finally, the memory of the unflinching fortitude and heroism of the soldiers of the line fills me with greatest admiration. To them I again pay the supreme tribute. Their devotion, their valor and their sacrifices will live forever in the hearts of their grateful countrymen.

In closing this report, Mr. Secretary, I desire to record my deep appreciation of the unqualified support accorded me throughout the war by the President and yourself. My task was simplified by your confidence and wise counsel. I am, Mr. Secretary,

Very respectfully,

JOHN J. PERSHING,
*General, Commander-in-Chief,
American Expeditionary Forces.*

ANNUAL REPORT OF CHIEF OF STAFF.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF STAFF,
Washington, June 30, 1919.

The SECRETARY OF WAR.

SIR: At the time of the preparation of my previous annual report existing conditions permitted only a very brief and general outline of the work of the General Staff during the period covered by that report.

The magnitude of the task performed by it, the diversity and the complexity of the problems involved and the nature of the difficulties that had to be overcome during the war, however, render it both desirable and necessary that a more detailed report as to some of the principal activities during this period be made, as time becomes available, in order that some of the more important lessons that have crystallized out of the experience of the war may be indicated.

MOBILIZATION OF ENTIRE NATION.

At the time the armistice with Germany was signed on November 11, 1918, the United States had sent across 3,000 miles of ocean more than 2,000,000 men and a vast quantity of supplies for their support and use. This American activity had been a positive factor in the concluding military actions of the war, culminating in the splendid drive through the Argonne Forest to Sedan.

Considering the distance over which the United States had to operate and the relatively short period of its participation in the war, the achievement is without parallel in the many great performances of the war. Moreover, the organization which made this achievement possible had been developed to such a point that the flow of men and supplies overseas in the ensuing six months would have been a still more impressive accomplishment.

These things were brought about only by the organization of the resources of the whole Nation for the carrying on of the war. This mobilization, not of a national Army merely, but of a whole Nation, was something which has not been seen in any former war. Germany first deliberately planned for war on such a scale and organized for this one purpose her whole national resources. It was necessary for France, England, and the United States to develop under the pressure of actual war conditions the machinery for such universal mobilization.

The declaration of war, on April 6, 1917, found the United States, from a military, industrial, and economic standpoint, thoroughly unprepared for the great task which confronted it.

In connection with the part played by the War Department in this task, I desire in this report to outline, in a general way, the evolution of the plans and the development of the organization of the General Staff, which, under the Chief of Staff, is charged by the Secretary of War with the planning, development, and execution of the military program. It will not deal with the subject of the manufacture of munitions, which will be covered by the detailed reports of the Director of Munitions and of the chiefs of the bureaus concerned, nor with the operations of the American Expeditionary Force in France, which will be covered by the report of Gen. Pershing.

ORIGINAL TENTATIVE ARMY PROGRAM.

In the consideration in the spring of 1917 of the military program to be adopted by this country, the amount of tonnage that would be available to transport and to maintain troops overseas was problematical in view of the submarine situation. The sinkings during the months of March, April, and May were very heavy and indicated the serious possibility that Germany's submarine campaign might so reduce ship tonnage that the Allies could not procure the necessary foodstuffs, metals, and supplies required for the successful prosecution of the war.

It was possible that only a comparatively small expeditionary force could be sent overseas, to increase the morale of the Allies and to decrease that of the Germans, reserving the greater part of the available tonnage to carry food and supplies to the Allies. It was, furthermore, considered by some, both in this country and abroad, that the United States would not be able to supply a large land Army and that, therefore, America's chief contribution should be a huge aerial force.

The tentative program adopted at that time accordingly contemplated:

(1) To send overseas promptly a small but complete body of American troops in the form of one tactical division for the purpose of serving as the nucleus for the organization and training of our overseas troops and for the resulting effect upon the morale of the Allies and of the Central Powers. It was essential, in order that the morale of the Germans might be lowered, that some American troops be put into the trenches at the earliest possible date.

(2) To follow this advance detachment by an expeditionary force of sufficient size, if the shipping situation permitted, to make American participation an effective factor in the prosecution of the war. The submarine situation and other conditions made it impracticable at this early date to determine the exact size of this expeditionary force, but in a general way it was contemplated that the capacity of the 16 National Army cantonments and the 16 National Guard camps which were under construction would enable approximately 1,000,000 men to be in France by the end of the year 1918.

(3) In May, 1917, when the plans and policies for our military effort were in a very formulative stage, the French authorities requested that the United States undertake a tremendous part in aerial warfare by sending 4,500 American aviators, and a correspondingly great amount of matériel to France within a year. In the Aviation Section of the Signal Corps there were approximately 35 officers who could fly elementary planes; there were no officers who had had training or experience with fighting ships. Furthermore, there were no fighting ships, no commercial industry for the production of the vast amount of aerial equipment required, and the aeronautical engineers in the country were negligible in number.

Urged by popular enthusiasm, the Aviation Section of the Signal Corps undertook an air program entirely disproportionate to a properly balanced Army and, as events showed, impossible of execution. The history of this transcendental program, which was adopted and undertaken by the Signal Corps practically independently of the rest of the Army, affords an early and a striking example of the necessity for a General Staff to formulate the military program and to coordinate the activities of the various agencies concerned. Such coordination was not, in the case of the air program, effected during the first year of the war.

THE 30-DIVISION PROGRAM OF OCTOBER 7, 1917.

The original tentative program crystallized into a definite plan when, in the early part of July, 1917, Gen. Pershing sent back to this country confidential preliminary recommendations covered by his "General Organization Project" of July 10, 1917. This contemplated the shipment overseas during 1917 and 1918 of an American Expeditionary Force of 30 divisions. Under date of September 18, 1917, Gen. Pershing submitted his "Service of the Rear Project" which was approved, and this was followed by his "Schedule of Priority Shipments" of October 7, which was likewise approved. This priority schedule, together with cabled requests received from time to time for special and additional troops, or embodying other minor modifications in the schedule, constituted the program by which priority of shipments overseas was established.

It was divided into six phases and provided for the placing in France by December 31, 1918 of 1,372,399 troops consisting of 30 divisions organized into 5 corps of 6 divisions (4 combat, 1 training, and 1 replacement) each, with the necessary corps troops, Army troops, service of supply troops, and replacements.

This program was the official approved military program when, on March 4, 1918, I assumed the duties of Acting Chief of Staff.

In the early part of 1918 the military situation was most critical. Due to the effectiveness of the steps taken by the British and the American Navies the submarine situation, while, of course, still a matter of great concern, was such as to make clear that the German unrestricted submarine warfare would fail to accomplish the results expected by its proponents, namely, to starve England out and to prevent to a large extent trans-Atlantic and cross-channel shipments of troops and supplies to France.

The situation on the land was, however, much more unfavorable to the Allies. Germany and her allies still maintained a numerical superiority on the western front, and this superiority was being increased daily by the transfer of troops who had been released, for service on the western front, as the result both of the elimination of Russia, during the winter, as an actual factor in the war, and of the defeat of the Italian army by the Austro-Germans in the fall. The German armies also possessed the advantages of shorter interior lines of communication, approximately three millions of Russian and other war prisoners who released soldiers for combatant duty, and trained senior and General Staff officers developed as the result of 40 years of preparation. Furthermore, they possessed the great advantages of unity of command, and of operating on the offensive in enemy territory.

While these advantages were exploited in every way possible in the German propaganda, it was known that the failure of the unrestricted submarine warfare to accomplish the promised results, the failure to capture the channel ports, and, in general the failure, notwithstanding the enormous losses, to terminate the war, were rapidly affecting the German morale. It was inevitable that the German high command would be forced to seek an early and decisive determination of the war by a military victory on the western front before the power of the United States could be developed sufficiently to become a decisive factor. England had reached the limit of her man power; France was exhausted; the necessity for their reinforcement, in the greatest numbers, and at the earliest moment possible was vital to the success of the allied cause.

When I returned to this country in March, 1918, it was with the firm conviction that it was imperative that the shipment of troops to France be vastly increased at the earliest practicable date, and have priority over everything else, and as this policy became effective studies were instituted as to the practicability of putting in France a sufficient number of men to bring the war to an early conclusion.

THE 80 DIVISION PROGRAM OF JULY 18, 1918.

After a study of the entire situation I came to the conclusion that the war might be brought to an end in 1919, provided we were able to land in France by June 30 of that year 80 American divisions of a strength of 3,360,000 men. On July 18, 1918, I submitted to you a formal memorandum, accompanied by a study of methods by which the men could be obtained, the supplies procured, and an analysis of the shipping which must be obtained in order to accomplish this very large military program. This was accompanied by an estimate of the cost of the proposed program.

In this study I recommended to you the adoption, as the American program, of 80 divisions in France and 18 at home by June 30, 1919, based on a total strength of the American Army of 4,850,000 men. This was approved by you and by the President of the United States and adopted as our formal military program.

The details of this program are shown in tabular form below:

Date.	During month ending on date indicated.				On date indicated.		
	Men to be drafted.	Movement overseas.			Total in American Expeditionary Forces.	Remain- ing in United States.	
		Reinforce- ment troops.	Replace- ment troops.	Total troops shipped.			
1918.							
Feb. 28.							
Mar. 31.							
Apr. 30.							
May 31.							
June 30.					1,000,000	1,450,000	2,500,000
July 31.	345,000	200,000	50,000	250,000	1,235,000	1,545,000

	2,750,000	2,155,000	605,000	2,760,000	-----	-----	-----

NOTES.—(a) The actual wastage of replacements is assumed at 400,000. (b) Organization into divisions is as follows:

Date.	American Expeditionary Forces.	United States.	Total.
June 30, 1918.	24	18	42
Dec. 31, 1918.	52	18	70
June 30, 1919.	80	18	98

In view of the great length of time required to produce the supplies and equipment required for a possible continuation of this program studies were at once begun on an extension of this program through the year ending June 30, 1920. This extension, which was approved September 3, was given out to the supply departments for their use in preparing estimates. It provided for an Army of 4,260,000, or 100 divisions, in France, and 1,290,000, or 12 divisions, in the United States, or for a total of 5,500,000 men by June 30, 1920.

Up to the signing of the armistice troops were being transported to France in accordance with the program of July 18.

This program, which embodied a material increase in the previous official program (it contemplated 2,350,000 men in France by Dec. 31, 1918, as compared with 1,372,399 contemplated by the program of Oct. 7, 1917), required for its accomplishment a marked intensification of the efforts of all agencies of the War Department and a thorough and effective correlation of their activities.

Preliminary steps.—Reference will now be made to some of the steps which were regarded as necessary or desirable in this connection.

As stated in my previous report, shortly after I entered upon the duties of Chief of Staff I adopted the policy of interchanging the offi-

cers of the various staff corps in this country and abroad, and pursuant to this policy men were placed at the heads of various bureaus whose experience in France especially equipped them for the handling of the problems pertaining to their respective bureaus in accordance with the methods and principles evolved and practiced during the war.

With your approval I also adopted for the entire Army the principle of promotion by selection, which had already been found by the responsible authorities in France to be a necessary prerequisite to efficiency in the American Expeditionary Forces, and I abolished all distinctions between Regular Army, National Guard, and National Army organizations and personnel, which had previously existed, by consolidating the entire Army into one Army—the Army of the United States. The experience of the war has proved that these steps resulted in a degree of efficiency throughout the Army that would not otherwise have been possible of attainment.

Extension of draft ages.—The studies made in connection with the new program showed that to carry it into effect required the enactment by Congress of legislation extending the draft ages to include men between the ages of 18 and 45 years and would necessitate the creation of a deficit, over the enormous appropriations already made, of approximately \$7,000,000,000. The presentation of the program to Congress, accompanied by the statement that this increase in the Army, if legislation were enacted by Congress which would enable it to be effective, would lead to success in 1919, resulted in prompt and favorable action by that body.

Troop and cargo ships.—Perhaps no subject was the cause of more concern in the execution of the accelerated shipping program or in connection with the formulation of the military program than that of the procurement of the vast amount of ship tonnage, especially cargo carrying tonnage, required for this purpose.

At the outbreak of the war there was operating under the control of the War Department a total of seven transports. The beginning of the great transport fleet under American control which, on the signing of the armistice, aggregated over 600 vessels of a total tonnage of more than three and one-half million dead-weight tons was made when the interned German vessels which had been seized came into service in the fall of 1917 with a tonnage of over 450,000 dead-weight tons.

Subsequent material additions, which were available in connection with the enlarged shipping program which was put into effect after I became Chief of Staff, included the Dutch vessels, aggregating about 300,000 dead-weight tons which were taken over by the United States, and the three great British liners which were assigned to the service of the War Department, in the early months of 1918. A serious deficiency in cargo ships which had developed led to the organization, in February, 1918, of the Shipping Control Committee, which regulated the allocation and distribution of available tonnage, both American and British. Through the cooperation of this committee, and as the result of the urgent representations made to the Shipping Board relative to the necessity of withdrawing additional ships from trade and of the chartering of every available ship that could be secured from any allied or other country, it was practicable to em-

bark, during the months of May, June, July, and August, 1,121,000 men.

On July 9, 1918, there were 75 transports carrying 171,670 troops en route overseas from the United States. This was the greatest number of troops on the water between the United States and France at any one time during the eastward movement. The embarkation for July exceeded all expectations, 306,000 troops sailing from Atlantic ports.

The department was able to announce to the President and the American people on July 1 that between May 8, 1917, and June 30, 1918, over a million men had either been landed in France or were en route thereto, and by September 22 it was able to announce that a second million had been sent.

Of the 2,082,000 men who had been embarked when the armistice was signed, over a million and a half had been embarked during the last 6 of the 19 months of our participation in the war. Of this number American flag ships carried approximately 44 per cent, the British approximately 51 per cent, the Italians 3 per cent, and the French 2 per cent. It may be stated here that, in the execution of this program, ways were found to increase the normal loading of our own transports without disadvantageous results of any consequence, by almost 40 per cent, and that the American transports surpassed those of the Allies both in the extent to which they were loaded and in the speed of their turn around.

When German submarines appeared off the Atlantic coast with the obvious purpose of delaying our shipping program, pressure was brought to bear on the department, not only from within this country but from our Allies who were cooperating in furnishing the shipping, to modify the program by changing the embarkation points to Canada. Realizing that the German military authorities appreciated the inevitably decisive effect of the continuation of the shipping program and having entire confidence in the effectiveness of the measures adopted by the Navy to protect the convoys of our troops, I declined to accede to the suggestions that any steps be taken which would result in any retardation of our shipment of troops to France. It is of interest in this connection that no United States transport was sunk on an eastward voyage during the period referred to.

A serious difficulty in maintaining this program, by a singularly unfortunate combination of circumstances, was the outbreak at this same critical period of the influenza epidemic which became acute at the time the necessity for the uninterrupted shipment of troops to France was most pressing. Some of the best medical advice at the disposal of the department regarded it as necessary, and so recommended, that the carrying capacity be decreased as much as 40 per cent as a precaution to prevent the ravages of the epidemic. After a most careful consideration of all phases of the situation I declined to approve a decrease of more than 15 per cent in this capacity, believing that this was sufficient reduction to afford every safeguard that was warranted by the urgency of the military situation and that it would afford, in effect, every advantage that was practicable. Events showed this decision to be fully warranted, since the careful observations made at the time showed conclusively that, as a matter of fact, the percentage of deaths from the epidemic on troop trans-

ports, was actually less than in the camps and cantonments in this country.

The studies made in connection with the formulation of the 80 division program showed that while the troop transport fleet which, as the result of unremitting effort, had been developed by the summer of 1918, could, without great difficulty, be relied upon to meet the requirements of this program so far as the transportation of troops was concerned, a serious deficiency in cargo shipping existed which would require early and radical action. In view of the great demands for cargo tonnage that had already been made on the shipping of this and all other countries in the building up of our transport fleet, the provision of the large amount of additional tonnage required by this program was a difficult and intricate problem. The only possible sources were the United States and England. In July, 1918, the American tonnage not in the War Department service comprised about 550 ships of an aggregate tonnage of about two and one-half million dead-weight tons. The extent to which this tonnage could be withdrawn required very careful consideration especially in the case of that employed in the nitrate, manganese, chrome, sulphur, and New England coal trades. Furthermore, a great part of this tonnage was not suitable for trans-Atlantic service on account of the fact that the ships in question were not of sufficient size to do satisfactory work when bunkered for the round trip, as was necessary in view of the reduced production of coal in Great Britain. As a result of the urgent representations that were made to the Shipping Board and the Emergency Fleet Corporation, however, a program was adopted with which during the period from July to November, inclusive, a total additional tonnage of approximately 2,000,000 dead-weight tonnage was rendered available. This total included approximately 1,000,000 tons which was withdrawn from the trades. It also included approximately 718,000 tons of new vessels (as compared with the Emergency Fleet Corporation estimates of 1,775,699 tons).

After making full allowance for all tonnage that could possibly be supplied from American sources, however, the study showed that the enlarged program would require the provision of additional tonnage amounting to 1,200,000 tons from August, 1918, and reducing month by month to 200,000 tons in February, 1919, and then ending. The only possible source from which this great amount of tonnage could be supplied was England. She had been hardest hit by the submarine warfare and, furthermore, she was at the time already bending every effort to assist in increasing the movement of American troops to France.

The situation, however, required radical steps if the allied cause were to be saved, and in view of this fact the Secretary of War and the Chief of the Transportation Service (then Chief of Embarkation) appeared before the Allied Maritime Council in London on September 30, 1918, and presented the needs of the United States for additional cargo tonnage to carry through the increased military program. The amount of tonnage required would transport about 2,000,000 tons dead-weight of cargo, and its allocation to the supply program of the American Army would result in the accumulation of a deficit of that amount of food and essential commodities for

Great Britain and the Allies. Notwithstanding this fact, however, and relying entirely upon the assistance of the United States later as new tonnage became available, England agreed to allocate sufficient tonnage to meet the requirements of the American program subsequent to the date of this conference.

The signing of the armistice on November 11, 1918, left uncompleted the great cargo program. The 80-division program contemplated monthly shipments, increasing by July, 1919, to 1,759,750 short tons; in November, 1918, approximately 825,000 tons were shipped.

The deficiency in shipping rendered it imperative that every possible step be taken to secure the maximum degree of efficiency from the shipping available. Special attention in this connection was paid to plans for still further decreasing the time of turn around. The importance of this is indicated by the fact that a reduction of 10 days in the average turn around of the cargo transports would at this time have been equivalent to an increase in cargo tonnage of approximately 386,000 dead-weight tons. Another important factor in this matter was the action taken to prevent port congestion in France. This was effected in part by the provision of the enlarged terminal facilities at the ports of debarkation and in part by the provision of great quantities of railroad transportation for use in the prompt evacuation of supplies from the ports.

In connection with the formulation and execution of the enlarged program it was also necessary to give consideration to other matters of primary importance.

Defects of bureau system.—As the war progressed it became increasingly evident that the organization of the War Department as it existed at the beginning of the war was in many respects entirely inadequate to meet the requirements of the situation.

Under the system of separate and independent bureaus, as organized when we entered the war, a condition of affairs eventually and inevitably developed which threatened the very success of any extensive military program. Each bureau, absorbed in the tremendous expansion of its personnel and in its problems of supply, naturally concentrated every effort upon the development of a program which would meet every possible requirement that might be imposed upon that particular bureau without reference, in general, to the requirements either of other bureaus or services or of the Army program as a whole. With this independent and uncorrelated action of the different bureaus the defects of the existing bureau system soon became manifest. There developed a competition for manufactured articles and for raw materials and for labor which resulted in high prices and in an inefficient distribution of labor, involving a scarcity in certain localities and actual unemployment in others; similarly there resulted a congestion in the placing of contracts and in the location of new manufacturing plants in many localities, irrespective of the labor, fuel, power, and transportation available. Plants and real estate were commandeered or purchased by individual bureaus without consideration of the effect upon the requirements of other bureaus, and no standardized contract procedure obtained to protect either the manufacturers and owners or the United States. The total lack of standardized specifications re-

sulted in a delay in manufacture, a lack of interchangeability, and an increased cost. Nine independent and different systems for estimating requirements were in operation, with a consequent lack of balance in the military program and inefficient utilization of the available manufacturing plants. There were five different sources of supplies for organizations to be equipped and five different and complicated systems of property accountability for the officers charged with equipping these organizations. There were 10 different agencies for handling money accounts in the War Department, with at least 5 different systems of fiscal accounts, with no adequate supervision of expenditures.

There existed no agency within the War Department for determining questions of priority among the different bureaus for manufactured articles or for raw materials. Furthermore, there existed no agency for representing the War Department as a whole in its relations with the War Industries Board in connection with the determination of similar questions of priority between the War Department and the other departments and agencies of the Government, although the Army requirements exceeded all others combined; it was impossible for the War Industries Board, in allocating supplies, materials, and manufacturing capacity, to secure adequate information as to the needs of the War Department as a whole. Individual agreements were being made by various bureaus with foreign governments involving obligations as to replacements and deliveries, which were without reference to the military program as a whole or to the tonnage available, and which was impossible of fulfillment. Each bureau had a more or less decentralized system of storage and was proceeding independently with the construction or procurement of new, and in many cases excessive, storage facilities. Each had a different system of property accountability and no practicable means existed for determining accurately and quickly from the records in Washington the amounts of supplies actually available.

There existed no effective means of traffic control for regulating and establishing priorities among the different bureaus as to shipments to ports. The necessity for such a system was especially emphasized by the fact that the relative urgency for different classes of supplies overseas was, necessarily, as indicated by the shipping priority schedule received, subject to frequent and sudden changes as the character of the operations and requirements of our overseas forces changed from time to time. Thus at one time railroad and construction material was most urgently needed, while at other times aviation equipment, medical supplies, motor transportation, and horses and mules were each given priority. It was accordingly impracticable to allocate cargo tonnage to the various bureaus far in advance, and it was essential that a system of traffic control be established which would be responsive, with the minimum of delay, to the changing priority schedules.

The lack of an effective system of traffic control resulted in such a competition for transportation and in such a congestion of railroad equipment, required not only for the shipment of our own supplies but for the shipment of those of the Allies as well, as to result in rendering inoperative a large part of the available railroad equipment of the country. This congestion of railroad equipment was in

part contributory to the fuel shortage which at one time threatened seriously to interfere with the sailing of our transports. This lack of an effective system of traffic control also resulted in the filling of the storage facilities at the ports and piers with unessential materials and thereby prevented the shipment of essential materials and supplies. This is instanced by the fact that it became necessary for the authorities in France at one time to protest strongly against the fact that certain bureaus were shipping mahogany desks and other office furniture in space which was urgently needed for food, medical supplies, and ammunition. It was rapidly becoming impossible to load the transports in accordance with the American Expeditionary Forces requirements as shown by the shipping schedules or to furnish adequate shipping lists covering the supplies actually shipped. It was evident that if the storage facilities, the railroad equipment, and the ocean tonnage were to be utilized promptly and to utmost capacity and in accordance with the actual requirements overseas, it would be necessary for a central controlling agency to control every shipment of materials and supplies from its point of origin in the United States to its delivery to the base port in France—to release the shipment from the factory or storehouse, provide the necessary railroad transportation to the terminals at the port of embarkation, collect it at the piers, and load it on the transport, all in accordance with carefully prearranged plans which articulated closely with the plans for organizing, training, and equipping the Army.

It may be noted here that the problem of the shipment, in the great numbers required, of troops from every camp and cantonment to France was closely analogous to that of the shipment of supplies. It involved the same necessity for observing overseas priorities, the same dangers of congestion at the ports of embarkation and the same necessity for a continuous and direct traffic control from the point of origin to the transport.

In order that the War Department might meet the great task and responsibilities imposed upon it by the war it had, during the first year of the war, become increasingly evident that a reorganization was necessary which would provide for:

1. A redistribution of existing functions of various bureaus in such a manner as to consolidate important similar or identical functions in the one agency best adapted to handle them.

2. The creation of certain new agencies to handle matter previously handled by existing bureaus but not logically a part of their function, and the creation of certain new services found to be necessary as the result of the developments and experiences of the Army overseas.

3. The reorganization of the General Staff in such a manner as to enable it to perform its proper functions of an effective central controlling agency to coordinate and to control all existing War Department agencies and services so as to eliminate lost motion and to direct their activities in such a manner as to further to best advantage the development and the execution of the military program as a whole.

The necessity for action along these lines had been recognized by the department and steps had been taken providing for a reorganization of this character to such an extent as was authorized by existing legislation. It was not, however, until the passage by Congress of the Overman Act, which was approved by the President on May 20,

1918, that it was practicable for an adequate and efficient reorganization to be put into effect.

Reorganization of the General Staff.—One of the most important matters taken up by the department during the earlier part of the war was the reorganization of the General Staff. Prior to the act of February 14, 1903, the United States Army had no General Staff. Since the early history of the country there had been a Commanding General of the Army and a system of semi-independent War Department bureaus which was loosely coordinated either with the line of the Army or with one another. There had long been uncertainty and dispute as to the respective functions and authority of the Secretary of War, the Commanding General, and the bureaus. During the Civil War this War Department organization proved so inefficient that a committee of Congress sat almost continuously to investigate the conduct of the war. The failures of the bureau supply system during the brief War with Spain is a matter of general knowledge. When Mr. Root became Secretary of War on August 1, 1899, he became convinced that there was a fundamental organizational defect in the War Department bureau system as it had grown up through more than a century of history. He pointed out that this system had developed in such a way as largely to tie the hands of the Secretary of War himself and to make it impossible for him to supervise and direct in any effective way the work of his department. After an exhaustive study of the matter he recommended to Congress, and succeeded in securing the enactment of, the organic act of February 14, 1903, which abolished the office of Commanding General of the Army and created a General Staff Corps of 45 officers, having at its head a Chief of Staff, who under the direction of the President and the Secretary of War was charged with the supervision of all troops of the line and of all War Department bureaus.

However, by the act of August 23, 1912, Congress reduced the strength of the General Staff to 36. The national-defense act of June 3, 1916, increased the strength of the General Staff Corps to a maximum of 55, exclusive of the Chief of the Militia Bureau and of the Chief of Coast Artillery, this maximum to be attained, by five annual increments, by 1920. This act, however, in effect still further decreased the strength of the General Staff Corps by providing that "not more than one-half of all the officers detailed in said corps shall at any time be stationed, or assigned to, or employed upon any duty in or near the District of Columbia." It also prohibited the Chief of Staff from attaching to his office for more than 30 days at a time any officers not members of the General Staff Corps.

On April 6, 1917, the date of the declaration of war, the General Staff, which was organized under the provisions of the act of June 3, 1916, had an authorized strength of 41 officers, the first annual increment only having been added. Under the limitations imposed by this act, the General Staff, on the date referred to, consisted of 19 officers stationed in Washington and 22 stationed elsewhere. The task of preparing the plans for creating, mobilizing, organizing, training, equipping, transporting to Europe, and of maintaining and supplying there the future Army of the United States accordingly devolved upon a group of 19 officers, who constituted the Gen-

eral Staff, authorized by law to be stationed in the city of Washington. This personnel was, of course, ridiculously inadequate, not only for the gigantic task confronting it, but for any General Staff work commensurate with the responsibilities of that corps. It is of interest in this connection to note that at the beginning of the war the strengths of the general staffs of Germany, France, and England were, respectively, approximately 650, 644, and 232.

The low ebb to which the General Staff had been brought at the time of the beginning of the war by restrictive legislation is indicated by the fact that on the signing of the armistice of the 1,072 officers on duty on or with the War Department General Staff but 4 had had previous General Staff experience; these 4 were general officers.

The act of May 12, 1917, increased the General Staff to 91 and removed, for the period of the emergency only, the restrictions of the act of June 3, 1916, relative to the number of these officers authorized to be stationed in Washington. This act was followed by the act of May 18, 1917, which authorized the President "to provide the necessary officers, line and staff," for the forces raised under this act, and removed, for the period of the emergency, the legislative restrictions as to the strength and organization of the General Staff Corps.

On June 30, 1919, the strength of the General Staff Corps was 253, including 130 detailed under the act of May 18, 1917, for the period of the emergency. There were at this time 395 officers detailed for duty with the General Staff, a reduction of 549 since the signing of the armistice.

The evolution and development of the present organization of the different divisions of the General Staff, from the nucleus of 11 officers on duty with the War College Division on the outbreak of the war, is outlined elsewhere in this report in connection with the account of the work of the individual divisions.

The first steps taken to organize the General Staff in such a manner as to enable it to perform its proper function of effecting the coordination of the activities of the various War Department agencies, which was recognized as being necessary to the successful accomplishment of the military program, was the issue on February 9, 1918, of General Order No. 14. This order organized the General Staff into five main divisions, namely, the Executive, the War Plans, the Purchase and Supply, the Storage and Traffic, and the Operations Divisions. It charged the Chief of Staff with "the planning and development of the Army program," and it provided that the chief of the Purchase and Supply Division should "have cognizance and supervision of the purchase and production of all munitions and other supplies" and should be charged with "the supervision and direction of all purchases, procurement and production activities of the several bureaus, corps, and other agencies of the War Department."

The General Staff was organized under this order on March 4, 1918, when I became Acting Chief of Staff.

The congestion at the ports had, however, become so acute by that time that unless adequate corrective measures had been taken without delay the movement of supplies overseas, both for this country and for the Allies, would undoubtedly within a few months have

been practically blocked. Experience had shown that the interior organization of the various bureaus was such as to render an effective supervision of their activities by the General Staff, as contemplated by General Orders, No. 14, impossible. As the result of a careful consideration of the matter I became convinced that a consolidation of procurement, except of certain specialized equipment, of storage, of finance, and of transportation, together with a positive and direct central control of these activities by the General Staff, was essential to the elimination of the unsatisfactory conditions existing and to the rapid, efficient, and economical utilization of the resources of the country to the development of the Army program as a whole. The magnitude of the task, the diversity of conflicting interests, and the intimate correlation required by the different agencies involved permitted no division of responsibility or of effort if the War Department machine was to function with that degree of efficiency which was essential if the urgent and constantly changing needs of our Army were to be met.

On August 26, 1918, with your approval, General Orders, No. 80, was issued. This order provided:

The Chief of the General Staff is the immediate adviser of the Secretary of War on all matters relating to the Military Establishment, and is charged by the Secretary of War with the planning, development, and execution of the Army program. The Chief of Staff by law (act of May 12, 1917) takes rank and precedence over all officers of the Army, and by virtue of that position and by authority of and in the name of the Secretary of War he issues such orders as will insure that the policies of the War Department are harmoniously executed by the several corps, bureaus, and other agencies of the Military Establishment and that the Army program is carried out speedily and efficiently.

This order definitely charged the Chief of Staff with the responsibility for the execution of the Army program and delegated to him the authority commensurate with this responsibility.

It further consolidated the previously existing Purchase and Supply Division and the Storage and Traffic Division into the Purchase, Storage and Traffic Division, under the Director of Purchase, Storage and Traffic, who was specifically charged with the "control of the * * * procurement and productive activities, including real estate, of the several bureaus, corps, and other agencies of the War Department, * * * the storing and warehousing of property for all departments, bureaus, and corps of the Army, * * * the movement of all property of the War Department, * * * and the transportation of troops and supplies overseas * * *."

Under the general authority contained in the Overman Act, which had been approved May 20, the Director of Purchase, Storage and Traffic was immediately upon the issue of General Orders, No. 80, authorized by me to effect a consolidation of the procurement (except in the case of the procurement of certain technical or specialized equipment pertaining to the technical corps) and of the storage functions of the various bureaus and services. The details of the procedure followed in this connection are given elsewhere in this report. In effect the result was to transfer these functions to the Quartermaster Department, already handling about 80 per cent of the procurement and storage activities of the Army, the Quartermaster General, who was designated as the Director of Purchase and Storage, reporting direct to the Director of Purchase, Storage and

Traffic. The transfer of storage functions had, however, progressed much further on June 30, 1919, than had the transfer of procurement functions. The consolidation of procurement rendered necessary a consolidation of financial activities under a Director of Finance, who, together with the chiefs of the previously existing Embarkation and Inland Transportation branches, also reported direct to the Director of Purchase, Storage and Traffic.

Another important change in the organization of the General Staff effected by General Orders, No. 80, was the establishment of the Military Intelligence Division, which had previously been a branch first of the War Plans Division and later of the Executive Division, as a separate and coordinate division of the General Staff. This was necessary in view of the extent and scope of the responsibilities of this division.

A subsequent and important amendment was made in General Orders, No. 80, when, by General Orders, No. 86, dated September 18, 1918, there was established, in the Operations Division, the Personnel Branch, in which there has been effected a consolidation of the handling of the appointments, assignments, and promotions of all commissioned personnel in the Army. This action became necessary as the result of the condition which arose due to the competition among bureaus and services for commissioned personnel and in order that officers might be assigned in accordance with their special qualifications to the arm in which their services could be most useful.

Other reorganizations.—In addition to the reorganization of the General Staff and the consolidation of bureau functions above referred to, it was necessary, in the comprehensive and adequate reorganization of the War Department to establish certain new agencies.

At the beginning of the war the Quartermaster Department had, in addition to its other duties, been charged with construction, motor transport, the Transport Service, and the pay of the Army. It had, early in the war, developed that these duties were of such an unrelated character and involved operations on such a scale as to render necessary a separation of these functions from the Quartermaster Corps in order that it might accomplish the tremendous task otherwise devolving upon it. The necessity for this separation of duties was emphasized when, with the consolidation of procurement and storage, the Quartermaster Department developed into the great procuring and storage agency of the Army.

The Construction Division, which was organized as a separate agency from the Quartermaster Department in the early days of the war, was called upon to handle what was probably the greatest construction project ever undertaken, involving expenditures aggregating more than twice the cost of the Panama Canal. The rapid expansion of the Embarkation Service, which was also organized as a separate agency in August, 1917, is outlined elsewhere in this report. These agencies had already been separated from the Quartermaster Department and, following the experiences in the war, a new service, the Tank Corps, had been organized.

This reorganization was continued on my arrival. The development and procurement of material and the handling of the personnel pertaining to gas warfare, which was at that time distributed among four bureaus, was, on June 28, 1918, consolidated into a new service

designated as the Chemical Warfare Service, with a resulting marked increase in the efficiency of this service.

A similar consolidation of all motor transport activities and operating matters, which had previously been distributed among the various branches and departments, of which the Quartermaster Department was one, was effected in the organization of the Motor Transport Corps on August 15, 1918, which placed this important development of the war upon a sound organizational basis along the lines evolved as the result of our experience in France.

The separation from the Signal Corps of the Aviation Section of that Corps and its organization into the Bureau of Aircraft Production and the Department of Military Aeronautics, which was effected on May 29, 1918, facilitated production and served to coordinate, for the first time, the air program with the Army program as a whole. It resulted in a marked and general increase in the efficiency of that service, which was still further increased by the consolidation on March 19, 1919, of these two agencies into the present Air Service under the Director of Air Service.

The necessity for the consolidation of finance activities, arising in part from the consolidation of procurement, and in part from the necessity of a central agency to handle disbursements, and to review and to prepare estimates for Congress, has already been referred to.

Such in general were the changes effected in the organization of the War Department by November 11, 1918, when the armistice was signed. This organization was an evolution and a development. It was a necessary outgrowth of rapidly changing conditions, and it was put into effect under the stress of war. It was based primarily upon a consolidation of functions in the bureaus and services best adapted to handle them, and upon the direct and effective control of these agencies by the General Staff in such a manner as to direct their various activities to the accomplishment of the common end—the execution of the military program.

NECESSITY FOR GENERAL STAFF CONTROL.

The history of the Revolutionary War, the Civil War, and the War with Spain had shown the necessity of a War Department organization of this character; the experience of the first year of this war had demonstrated clearly that without such an organization the effective accomplishment of the tremendous military program required by a modern war was impossible.

Prior to the war, due to the legislative restrictions imposed upon its organization, no adequate General Staff organization was possible. Neither the bureaus nor the General Staff were, therefore, familiar with the best method of establishing an effective system of General Staff control. It was accordingly necessary for the details of such a system to be worked out, and for the necessary points of contact between the General Staff and the bureaus to be established, under the stress of war.

By March 4, 1918, when I became Chief of Staff, the critical military situation required action, and results, if the imperative needs of our Army overseas, and of the allied cause, were to be met. The existing organization of the various War Department bureaus and

services was such that it did not permit the efficient supervision and control of their activities which was imperatively required if the military program were to be carried out. The consolidation of related activities which was necessary to attain this end required a degree of actual administrative control, if results were to be secured with the expedition and effectiveness that was necessary, which, in some cases, was not essentially or fundamentally a General Staff function. Had a proper and adequate General Staff organization and supervision been in existence before the war this degree of administrative control by the General Staff would not have been necessary. Under the existing conditions, however, no other alternative existed if the military program as a whole were to be carried out, and I subordinated all other considerations to the attainment of that end.

PEACE ORGANIZATION.

Upon the signing of the armistice there was both the time and the opportunity for a clearer definition of the functions and organization of the existing agencies than had been practicable during the active continuation of the war. This work was promptly undertaken, and by June 30, 1919, the end of the period covered by this report, substantial progress had been made in this direction by a reorganization of the Purchase, Storage and Traffic Division which in effect established as four separate and distinct administrative and operating services, the Purchase and Storage Service (a development of the Quartermaster Department), the Transportation Service, the Financial Service, and the Real Estate Service, which, like all other operating bureaus and services of the War Department, are under the control and supervision of the Director of Purchase, Storage and Traffic, as assistant to the Chief of Staff, in all matters which pertain to the supply, transportation, and financial operations of the Army. Such control is essential to the accomplishment of any military program.

The experience of the war has unquestionably demonstrated that this organization is sound in time of war. It is equally sound in time of peace. To revert to a peace organization which must inevitably be disrupted again in time of war would be to discard the costly and invaluable lessons gained from the experience in this war. It is essential that the peace-time organization be such as to require, in time of war, merely the expansion of existing agencies—not the creation and organization of new ones.

RESULTS ACCOMPLISHED.

The general nature of the evolution of the War Department organization which was developed to carry into effect its military program has been outlined, and reference has been made to some of the considerations involved in the development of this organization. The results accomplished are indicated by the fact that on November 11, 1918, the date the armistice was signed, the total of the embarkations for France, as stated above, was approximately 2,082,000. Of these more than a million and a half had embarked within the preceding six months.

No movement of any such number of persons by water for such a distance and within such a time had ever previously occurred. Furthermore, no such troop movement had ever been considered possible. No studies made by the General Staff in this country prior to the war or during the early period of the war had contemplated the practicability of transporting more than 100,000 men a month across the Atlantic. A War Department estimate made late in December, 1917, contemplated 1,030,000 troops in France by October 1, 1918. A similar estimate made on March 1, 1918, contemplated that this number would be approximately 1,088,000. An estimate of the Headquarters of the American Expeditionary Forces, in France, of this same date, contemplated that the strength of the American Expeditionary Forces on September 1, 1918, would be 771,000. It is of interest to note in this connection that soon after the United States entered the war the chief of the German imperial general staff stated for the information of the German people and of the world that the United States could not equip and transport abroad within a year an army exceeding 500,000 men. On July 1, 1918, America answered with the statement that the first million had sailed, and a second million followed in the next four months. At the time the armistice was signed the strength of the American forces in France exceeded that of the English, and within the next two months it probably would have exceeded that of the French. On April 1 the Germans had a numerical superiority on the western front of not less than 300,000; at the time of the signing of the armistice the Allies had attained a superiority of not less than 600,000, due almost entirely to the arrival of American troops. These results speak for themselves.

The record established in the transport of the Army to France has been surpassed only by that established in effecting its return to this country after the signing of the armistice. The demobilization of the Army, which involved a reversal at full speed of the entire machinery of the War Department, afforded a severe test of the efficiency of the existing organization, and in particular of the General Staff. That this test was satisfactorily met is shown by the results attained.

Due to the necessity for the withdrawal by Great Britain of the greater part of her troop transports for use in returning her Canadian, Australian, New Zealand, and Indian troops, radical and immediate steps were necessary to procure additional troop transport tonnage for the return of the American troops, as the carrying capacity of the American flag ships on November 11 did not exceed approximately 110,000. I accordingly gave instructions immediately for the conversion of about 58 of the fastest and most suitable types of cargo vessels into troop ships. As the result of this action, of the use of such battleships and cruisers as could be assigned by the Navy for troop transports, and of the utilization of such other ships as could be secured, between November 11, 1918, and June 30, 1919, there were embarked from France for the United States 1,610,074 men, of which 84 per cent were returned in American flag ships, 8 per cent in British-controlled ships, 3 per cent in Italian ships, and 2 per cent in French ships. During the month of June all previous records were broken by the landing in this country of 343,786 men.

The work performed by the various divisions of the General Staff in connection with the execution of the Army program and in connection with the demobilization of the Army, to include June 30, 1919, will now be outlined.

During the year ending June 30, 1919, the following officers, as assistants to the Chief of Staff, were in charge of these divisions:

Maj. Gen. Henry Jervey, Director of Operations, throughout the year.

Maj. Gen. George W. Goethals, Director of Purchase, Storage, and Traffic, to include February 28, 1919.

Maj. Gen. George W. Burr, Director of Purchase, Storage, and Traffic, since March 1, 1918.

Brig. Gen. Lytle Brown, Director of the War Plans Division, to include June 15, 1919.

Maj. Gen. William G. Haan, Director of the War Plans Division, since June 16, 1919.

Brig. Gen. Marlborough Churchill, Director of Military Intelligence, throughout the year.

In addition to the foregoing chiefs of divisions, Maj. Gen. Frank McIntyre has, throughout the year, as executive assistant to the Chief of Staff, been my principal assistant, and has acted as Chief of Staff in my absence.

During this period, Col. P. P. Bishop, General Staff, served as secretary of the General Staff to include September 11, 1918, and Col. Fulton Q. C. Gardner, General Staff, has served as such since that date.

II. THE OPERATIONS DIVISION.

The Operations Committee of the War College Division in the first part of 1917 was charged with: (1) Arranging in accordance with prescribed Tables of Organization for the organization of tactical divisions and other troops by designating and assembling the specific units of which they were to consist; (2) making studies relative to tonnage available for shipment of troops, and preparing schedules for shipments to France. The Equipment Committee of the War College Division was charged with the preparation of tables of equipment for all units, and with the supervision of the distribution and issue of equipment to troops. In the reorganization of the General Staff, effected by General Order No. 14, War Department, dated February 9, 1918, these committees were consolidated into the Operations Division, in which the Operations and Equipment Branches with the same personnel continued to perform the increased duties of the old committees. In addition new branches were established for various additional duties assigned to this division. The general functions of the Operations Division during the war included the following:

(a) The recruitment and mobilization of the Army, including the assignment and distribution of the draft; the personnel of troops; the movement and disposition of troops; the determination of all overseas priorities.

(b) The appointment, promotion, transfer, and assignment of the commissioned personnel of all branches of the Army (after Sept. 11, 1918).

(c) Supervision of selection of sites for camps, cantonments, hospitals, and other construction projects for all branches of the Army except for harbor terminal facilities, including permits to build on military posts or stations, camps, or cantonments.

(d) The determination of types and the general basis of distribution of all types and quantities of equipment and supplies of all branches of the Army, and regulations concerning the same.

(e) The standardization of the design and the reception, storage, maintenance, and replacement of all motor vehicles.

It was responsible for the actual mobilization of the troops, for insuring and properly directing the equipment of these troops, and, in cooperation with the Embarkation Service, for directing their movement to the ports for transportation overseas, all in accordance with the Army program. In performing these duties the Operations Division came in contact with practically every branch and department of the Army.

MOBILIZATION OF THE FORCES—THE OPERATIONS BRANCH.

Progress of mobilization.—On March 31, 1917, there were in the Regular Army some 128,000 officers and men. Between March 25 and June 23, 1917, in addition to the National Guard troops that still remained in the Federal service from the Mexican border calls of May 9 and June 18, 1916, the President called into the service of the United States a large part of the National Guard. On April 1, 1917, the enlisted strength of the National Guard in the Federal service was 63,395, and in the State service 110,933; in reserve, 8,207; total, 182,535. The entire National Guard was drafted into Federal service by proclamation of the President on July 3, 1917, and the draft was completed, with the exception of the National Guard of Hawaii and of a small number of the Virginia National Guard, on August 5, 1917. The maximum authorized strength of the National Guard when it was drafted into the Federal service was 13,093 officers and 419,834 men. The actual strength drafted in all, up to and including August 5, was 12,100 officers and 367,223 enlisted men (including National Guard Reserves). Of these the number of recruits having less than three month's National Guard service was, on June 30, 1917, approximately 130,000, or over one-third.

The Operations Branch of the Operations Division after the first few months was in charge of the mobilization of the Army. It controlled the supply of men for the Army and was in charge of the distribution and assignment of all men entering the service, whether such men were drafted men or volunteers. It determined in accordance with the approved policy when and how many draft registrants should be called, the camps to which men should be sent, the organizations to which they should be assigned, the priority in which organizations should be sent overseas, and the time when they should be moved from their camps.

Manifestly considerations of training dictated the calling of all men at the earliest possible date, but the lack of woollen clothing and equipment was one of the main factors which restricted the calls. With the advent of spring and warmer weather, the calls were greatly increased. The following table shows, in round numbers, the mobilization effected from month to month:

MOBILIZATION OF THE FORCES.

Month.	Drafted.	Voluntary enlistments.	Aggregate.
1917.			
September.....	297,000	<i>All ages.</i> 24,000	321,000
October.....	164,000	31,000	195,000
November.....	36,000	46,000	82,000
December.....	20,000	142,000	162,000
1918.			
January.....	23,000	<i>Outside draft ages.</i> 41,000	64,000
February.....	84,000	26,000	110,000
March.....	132,000	25,000	157,000
April.....	174,000	23,000	197,000
May.....	373,000	26,000	399,000
June.....	302,000	28,000	330,000
July.....	401,000	19,000	420,000
August.....	283,000	11,000	294,000
September.....	263,000	-----	263,000
October.....	107,000	-----	107,000
November.....	7,000	-----	7,000

The actual charge of the draft machinery and the direction of the details of calling the draft were in the hands of the Provost Marshal General. The number to be called and the time and place to which they were to report was fixed by the Operations Branch.

Sources of man power.—The men to be mobilized were drawn from two sources—voluntary enlistment and the draft. Throughout the spring and summer of 1917 the first source was heavily drawn upon to bring the Regular Army and the Federalized National Guard to war strength. It had been early recognized, however, that this method would prove defective, not only in providing the total numbers required, but in doing so in an orderly manner with the least possible disturbance of the industrial life of the Nation. The selective service law as passed by Congress May 18, 1917, without which it would have been impossible to have raised the men necessary for victory, provided a solution for these problems, and furnished a practically inexhaustible source of man power. The first draft of 687,000 men was called to the colors from September 5, 1917, to the spring of 1918. This draft not only gave the basis of the new National Army, but also furnished over 200,000 men to the Regular Army and National Guard, as well as to various special and auxiliary organizations. This draft had been made up of men from class 1 of the original registration of June 5, 1917, which had included all men between the ages of 21 and 31. It became apparent in the spring of 1918 that this class would become exhausted about September of that year. A second registration was held May 20, 1918, for men who had attained the age of 21 since the first registration.

In addition, and to meet the requirements of the enlarged program of July 25, Congress on August 31 authorized the extension of the provisions of the selective service law to include all men between the ages of 18 and 45 years. On September 12 a third registration was held on this basis. This provided a reservoir of class 1 fighting men adequate to any emergency. On December 15, 1917, voluntary enlistments were discontinued in order that more complete control might be established over the transfer of man power from industries to the Military Establishment. To meet the desires

of many to choose their branch of the service, however, and to provide for the needs of the staff corps and departments and of the Students Army Training Corps established in the fall of 1918, a modified form of voluntary enlistment through draft boards was authorized. This was known as "voluntary induction." While the urgency of securing men of certain special qualifications more rapidly than they were produced in the general run of the draft calls in many cases rendered this action desirable, in general the authorization of voluntary inductions produced an undesirable competition among the Staff Corps and special services concerned. It also impaired the accuracy of the records of the Provost Marshal General as to the available supply of men. While this plan undoubtedly served to expedite the formation of many units for shipment overseas it was, for the reasons above indicated, discontinued shortly before the signing of the armistice. This system was also used as the means by which men of the draft age could enlist in the Navy and Marine Corps. Selective service was, therefore, the real source of the new Army as is indicated by the fact that it provided 2,800,000 of the 3,700,000 men in service during the war. In all former wars, perhaps the greatest problem which this country had had to face was that of securing men. Profiting by our past experience and that of Great Britain in this war, Congress, by the foresight and wisdom displayed in the passage of the selective service act, rendered the problem of man power for the United States one of methods, and not of sources.

Reception of recruits.—In the arrival at the camps, under the supervision of the Provost Marshal General, of the men so summoned, each draft quota covered a period of about five days. These thousands of civilians pouring into the designated camps were selected men under the selective service regulations. Not, however, until they had passed into the control of the camp commanders and had been given another rigid physical examination, and not until all their records had been completed was their final entrance into the military service accomplished. It devolved upon the Operations Branch to control the assignment and use of all military camp and post accommodations. In the arrangements made for mobilization and future training all men allotted to the Aviation Section (later Air Service) were turned over to that arm, which had a system of concentration camps and flying fields entirely separate from the camps and cantonments of the balance of the Army, although under General Staff supervision. The building of the cantonments was authorized in May, 1917, the last site was secured July 6, and on September 4 accommodations were ready for 430,000 men. This capacity was shortly increased to 770,000 for the 16 cantonments built. Construction of the 16 camps went forward at the same rapid pace, providing for a total of 684,000. Troops were also accommodated at many other points, such as the extensive system of flying fields and other schools of the Aviation Section (Air Service), schools for the Artillery, Engineer Corps, Chemical Warfare, Tank Corps, Quartermaster Corps, the proving grounds and testing fields, embarkation camps at the ports, etc. For these purposes housing was constructed with a capacity for more than 300,000 men, bringing the grand total to about 1,800,000. This system had been built with the

expectation that it should accommodate an army from which approximately 1,000,000 men could be shipped overseas in one year. By May, 1918, because of developments abroad and increased shipping facilities, it was being called upon to receive an army from which a force must be shipped at more than double that rate.

A factor which early in the war rendered it impracticable to call the total number of men required to increase the actual strength of all camps and posts to their full capacity was that the need of special machinery to receive the drafts made necessary the restriction of their first mobilization to certain camps. The number of men, therefore, who could be drafted at any one time was affected not only by the capacity of the camps and by the availability of clothing, equipment, etc., but by the efficiency of the receiving machinery. There were established in each of the 16 National Army divisional cantonments what were known as depot brigades which performed this service. The depot brigades were originally intended to train that portion of the draft to be used as replacements. Later they acted as receiving units for men sent from the draft boards throughout the country, giving them their first elementary military training, classifying them, and distributing them as the calls arose to fill organizations in this country to full strength and to provide men who had had special and technical training in civil life for the organization of such special units as railroad engineers, radio operators, various construction projects, etc.

In calling the first draft to the colors many men were actually put directly into combat organizations and later in the war certain camps (notably, Camp McArthur, Tex.), in the absence of depot brigades, established special receiving units of their own. The difficulties, however, of assimilating recruits into the Military Establishment made it desirable and necessary to provide a uniform system for this task. The original authorization of depot brigades had been based on the idea that in addition to serving as receiving points, these depots would provide a surplusage of troops which was to be used as a source for man-power with which to supply vacancies caused by losses of all sorts. The function of receiving all drafted men entering these cantonments had indeed been undertaken by the depot brigades more to meet an emergency than in the performance of their main purpose, the provision of replacements. The history of mobilization during the winter of 1917-18 in the National Army cantonments is in greater part a history of the development in the depot brigades of this emergency service into a highly specialized receiving system.

The proper mobilization of the Army could only be accomplished by a well-planned and carefully directed system of distribution of recruits. In this task the old units had to be reorganized, split up, or combined; the new units were still to be created. A peculiar difficulty of this latter task arose from the fact that the National Army, in addition to providing 16 divisions, constituted the central source of man power for the completion and final organization of the Army as a whole.

The tasks of the National Army cantonments at the beginning included: (1) Receiving all drafted men; (2) equipping, examining, and classifying the men received; (3) selecting and training special-

ists from the drafted men for various organizations of the Army; (4) providing special treatment for drafted men unfit for combat duty but not sufficiently unfit to warrant their discharge; (5) creating and maintaining the National Army divisions; (6) filling Regular Army and National Guard divisions to authorized strength; (7) organizing units or supplying selected personnel for corps and Army troops, Service of Supply troops, and the various staff corps and departments; and (8) training and forwarding replacement troops for all these forces.

Many of these duties were eventually performed by special camps organized for particular purposes, such as the provisional depot for corps and Army troops, the replacement camps, etc.

Careful consideration was given to the desirability of the maintenance of the local character of units in training for service, but this plan was found to be impracticable. Each military unit is composed of a fixed proportion of specialists, all of whom could not be furnished by any section or region of the country with the highly irregular vocational distribution of its population. As an example, each division needed chauffeurs, mechanics, telegraphers, machinists, automobile repair men, engineers, carpenters, radio operators, etc., of whom there was a scarcity in farming and agricultural communities, whereas they predominated in manufacturing centers. Had local character of units been preserved, some divisions could not have operated because of the lack of such men who would have crowded the ranks of another division in which the skill of many would have been lost to the Army. Furthermore, if, for example, all replacements for the Twenty-sixth Division, which had 15,168 casualties, were to be drawn from New England alone, while another district furnishing men for a division serving in a quiet part of the front, and with no considerable losses, had to furnish only the replacements for the division from that district, an obvious injustice increasing as the war went on would result. Another effect would have been the consequent disorganization of an important manufacturing district. Irrespective of these phases of the question, however, it was considered that the prompt and satisfactory replacement of casualties would in itself have rendered it impracticable, under the conditions obtaining in actual service, to have maintained the local character of organizations, and the experience of the war demonstrated unquestionably the correctness of this decision. In view of these facts, it was decided to create a reservoir of replacement troops for all forces to consist of drafted men from all localities.

Practical difficulties of mobilization.—The first drafts were called to the colors in the early fall of 1917. Many complex problems followed the arrival of the quotas at the various camps. In particular three factors made increasingly difficult the carrying out of the original plans for supplying men from the depot brigades both to create special troops and to supply general replacements.

These factors were:

(1) The difficulty in the camps themselves of supplying large enough numbers of men to meet these calls as they arose (due to the lack of adequate reserve stores of woolen clothing and the impossibility of securing this clothing from the manufacturers before the winter had set in).

(2) The necessity of using drafted men to fill National Guard and Regular Army divisions scheduled for early departure (a necessity that took over 200,000 from the National Army cantonments).

(3) The necessity of providing technically trained specialists from the draft for the special organizations required by corps and Army troops, and the Services of Construction and Supply.

As a result there began a constant drain of drafted men from the National Army cantonments, which lost men faster than it was found possible to replace them with new increments. The first difficulty was eventually overcome by production meeting requirements.

The second was important in its effect, since the number of men taken from the National Army cantonments seriously affected the morale and efficiency of these cantonments. The remedy lay in calling more men to the service, which on account of the first factor, could not be done until the spring of 1918. The third factor was both important in effect and exceedingly difficult of solution. The rapidly expanding program called for a disproportionately increasing amount of Service of Supply, corps, and Army troops, which were largely made up of Quartermaster, Ordnance, Engineer, Signal Corps, Medical Corps, and similar special personnel. This demand was due to the fact that the creation and maintenance of our overseas Army at such a distance from the home bases, necessitated meeting with military personnel the requirements of the tremendous construction program without which the Army could not exist or operate. For the allies to maintain their own armies on the western front taxed their own abilities to the utmost, and it was necessary for the American Army to provide its own personnel for this work. The demand for specialists increased by leaps and bounds, and all military organizations in this country were combed over again and again to locate skilled men and transfer them to organizations where they were required in order to enable our overseas forces to perform their mission.

The necessity of a reorganization of the system of receiving, classifying, and distributing recruits in order to overcome these difficulties became evident. The basis on which the depot brigades were authorized was completely changed.

The enormous amount of administrative duties entailed in the various examinations, classifications and transfers made it apparent that the original incidental purpose of the depot brigades had, in fact, become, and should be recognized as, their main purpose. Throughout 1918 the great task of the depot brigades became the reception of recruits into the Army and their distribution to their organizations. To receive raw recruits; to separate the fit from the unfit, the literate from the illiterate; to classify them by intelligence and by vocational ability; to put them into uniform and instill the rudiments of discipline; and finally to group and entrain them to meet the calls always on hand, these were the final functions of the depot brigades. This was an arduous and unspectacular task involving much drudgery on the part of those who carried it out, but it was a task the successful accomplishment of which made our rapid mobilization possible.

The experience of the fall and winter afforded a clearer conception of the exact needs of the new armies, and of the composi-

tion of the increments received from the draft. This experience led to the establishment of specific units responsible for the performance of certain specific duties. Physical examinations were necessary; allotments, insurance, and service records must be prepared; if the Government were to receive full value of their services, the better educated and keener men must be discovered by mental tests and vocational skill had to be ascertained. At first, these results had been accomplished in a more or less haphazard manner by the overworked company and battalion officers. In the final organization as developed step by step in the late spring of 1918, special camp organizations were created for each such duty.

Special medical boards gave the recruit his physical examination; the camp personnel officer attended to his allotments and initial records; a psychological board gave him a special mental test; a trade-test detachment under the personnel officer determined his special ability. Through the company the men received their equipment, their first training and their initiation into Army life. Many men received from the draft suffered from minor physical defects which rendered them unfit for immediate service, but which might be remedied by medical attention. An astounding and alarming percentage could not speak, understand, or write English. These men, who had formerly held back the general progress of whatever units had received them, were grouped into the "development battalions" organized for the special purpose of enabling them to transfer these men back to the service, capable of performing a soldier's duties. A decentralization of duty and responsibility was developed within the receiving cantonments. Thus in general, the progress of these changes was toward a single receiving establishment in which all the detachments worked together, so that the recruit might enter one door in his civilian clothes, strip for his physical examination and first inoculation; pass to another room where he would receive and put on his new uniform; then to another room where trained clerks would prepare his records and allotments. As a final step his trade ability would be tested and recorded; whereupon the recruit would leave the building, ready for his first training.

Through the systems of examination and classification in the camps, the Operations Branch was able to ascertain the character as well as number of the recruits available for assignment to units at any time. The increasing movement of divisions overseas left more cantonments available and thus made possible a further decentralization of mobilization machinery. Replacement camps which were later established for special services, as described elsewhere in this report, not only trained replacement quotas for these services, but furnished a great part of the special units required for corps and Army troops and the Service of Supply. The National Army training detachments in universities and schools of all sorts produced thousands of specialists and technical experts. It eventually was practicable to provide a definite source of material for nearly every special unit as required. The combat divisions after the spring of 1918 were then able to devote their entire time and attention to combat training, with a minimum of distraction, and without suffering losses of personnel through requisitions to fill other units urgently needed.

This complete decentralization of functions whose course has been indicated was accompanied, however, by an equally complete central control by the Operations Branch. By this system the whereabouts and numbers of all classes of men were known, and as need arose for specially qualified men to fill organizations being formed the branch was enabled properly to distribute them.

The essential features of the final organization adopted at National Army cantonments were (a) the method of classification, (b) the system of requisition, and (c) the determination of priority in filling the requisitions. Classification was usually accomplished during the first 10 days after the recruit's arrival. Reports showing the vocational qualifications of all men were sent to the War Department and were promptly tabulated. This work was performed by the Committee on Classification of Personnel of The Adjutant General's Office under the immediate supervision and direction of the Enlisted Personnel Section of the Operations Branch. It was then possible to assign men coming into the Army as nearly as practicable to their own trade or former occupational training. The requirements of the Army were determined by general studies of the vocational composition of all military units, and by specific requisitions from the special services such as the Signal Corps or the Chemical Warfare Service, for the particular classes of men they needed. The Committee on Classification, under staff supervision, received all requisitions for enlisted men, analyzed their requirements and drew up the orders of assignment upon the basis of the tabulated reports and in accordance with the general program. Under this system the committee supplied 42 per cent of the Coast Artillery Corps, 44 per cent of the Field Artillery, 64 per cent of the Signal Corps, 45 per cent of the Engineers, and 41 per cent of the construction troops.

Another organization, the Committee on Education and Special Training, through its system of prefatory training of potential soldiers not yet called to service added greatly to the supply of men having knowledge of the trades desired while the schools for specialists within the Army itself played a final part in solving this most difficult problem—the provision of specialists. A final feature of the system was the determination of priority in assigning personnel to the units. This included troops for the line units to which went the vast majority of men drafted as well as the soldiers with special qualifications.

With an ever enlarging program, it was practically out of the question to meet at any time all of the demands for personnel. The calls for men on the part of all organizations early became insistent and each branch of the service, in its earnest efforts to furnish its enlisted quota on time and in a proper state of training, had exercised such zeal and persistency in its calls for men, that analysis of all needs and careful control of assignments by the General Staff were necessary for effective distribution of the men available. Indeed the original supply of men skilled in certain trades had been well nigh exhausted when the armistice halted new effort. The determination of priorities between requisitions from any one staff corps or department was made almost entirely upon the recommendation of the chief of the staff corps or department concerned, but,

priorities between requisitions of one staff corps and those of another, or of the line, were determined by the Operations Branch in accordance with the requirements of the shipping program and with due consideration to the relative minimum period of training required.

The final organization developed for the creation of the emergency Army, which included the establishment of special depots as reservoirs for particular classes of troops, such as replacement troops, corps and Army troops, service of supply troops, or individual specialists, accomplished in an efficient manner the assignment of men to duties for which they were best suited—the orderly fitting of round pegs into round holes and square pegs into square holes. In the absence of a system of universal training, and because of the lack of time to train the specialists within the Army itself, the assignment of men with particular civilian training to the positions within the Army which required a corresponding ability proved the best solution possible. It made it possible to shorten the time of organizing the new Army by many months.

Replacements.—There is perhaps no subject in which the experience of the war affords more important or conclusive lessons than in connection with the subject of replacements. For any army in the field the vacancies created by the dead and wounded are but a small part of the total number of casualties which must be replaced to maintain combat efficiency. An early estimate fixed the replacements at about 10 per cent a month needed for each combat unit at the front. This was at times exceeded. This 10 per cent loss would have meant theoretically complete change in personnel in each combat unit every 10 months. The percentage adopted after actual experience was an approximate average of 5 per cent of the total American Expeditionary Forces, combatant and noncombatant together, a percentage which amounted to well over 50,000 a month toward the end of the war.

The first plan, as has already been stated, was to train all replacement troops in the depot brigades at the National Army Cantonments, including not only those for the National Army, but those for the Regular Army and National Guard as well.

The plan adopted, which would probably have met satisfactorily the requirements of the extremely limited military program which was, at that time, contemplated, did not afford a satisfactory solution of the problem of providing the replacements required for the 30-division program which was soon adopted. It was entirely inadequate to meet the requirements for the replacements for the final 80-division program. Even prior to the adoption of this program it became apparent that the depot brigades, in view of the many and complex duties which devolved upon them in connection with receiving and distributing the drafted men, could not also adequately include the function of replacement training. Upon my arrival in this country I took steps to carry to their consummation at an early date plans for a new and more comprehensive system of training replacement troops on a scale commensurate with the increase in the military program over the earlier conceptions of 1917, which had been under consideration during the winter of 1917–18. This system abandoned any idea of using parts of divisional cantonments for replacement

training and contemplated utilizing entire camps for this purpose as soon as the departure of a sufficient number of National Army divisions would make such camps available.

In the meanwhile the serious problem presented itself of providing not only the replacements required for the troops overseas but also those required for the divisions scheduled for early departure to replace the very considerable number of vacancies which occurred due to the elimination of the physical and mentally unfit, aliens of disloyal tendencies, conscientious objectors, and other classes which were unsuitable for combat duty, and to provide the special and technical troops required for their efficient operation. It was realized that the replacement troops for these divisions might not be able to receive more than a limited amount of training in France before it would become necessary for the divisions to take their places in the front line and that it was essential to the efficiency of these divisions that they be furnished without delay replacements which had received the greatest amount of training possible.

The only practicable solution to this problem was to supply these replacements from the divisions scheduled for later departure and to replace them from the new draft quotas.

This plan, which was put into effect, necessitated the depletion of the divisions concerned to a degree which undoubtedly resulted in a serious setback to their training and which exercised a material effect upon the morale of both the depleted divisions and those that were brought to full strength as a result of this depletion. It was, however, an unavoidable measure which was necessary if the military program was not to be delayed, and which was warranted by the urgent military situation. The necessity of making adequate provision in any future military plans for initiating the training of sufficient replacements contemporaneously with the organization of the combat troops is obvious.

In order to provide to the greatest possible extent for the tremendous and inevitable requirements for replacements for the overseas forces involved in the increased military program, and in accordance with the plans for a comprehensive system of replacement training above referred to, beginning with April, 1918, replacement training camps were started as follows: Infantry at Camps Lee, Gordon, Pike, MacArthur, Grant; machine gun at Camp Hancock; Field Artillery at Camps Jackson and Taylor. Certain special camps in addition to their duties provided for the training of replacement troops for their particular corps or departments. Among these were Camp Joseph E. Johnston for the Quartermaster Corps; Camp Humphreys for the Engineers; Forts Oglethorpe and Riley for the Medical Department; and Camp Alfred Vail, N. J., for the Signal Corps. The purposes of these camps were to receive untrained men from the draft through the depot brigades and to give them thorough intensive training in their respective arms of the service. To insure that these replacements would be in adequate proportion to the actual needs of the combat forces, the system known as the "automatic replacement draft" was established. The purpose of this system was to send abroad each month replacement troops in a number which would more than provide for the total number of casualties during the month, and which would be propor-

tionately distributed among the different arms of the service. Thus, replacements for the Infantry, which had the burden of the heaviest losses to bear, was estimated at 60 per cent of the total draft for each month. The percentages of the remaining arms were fixed according to the relative proportion of the total number of each arm in France. It was possible to determine in advance from the programs and to check up from time to time according to special needs and emergencies, the approximate numbers of replacements which would be required for any given month. This number was then apportioned by Operations to the various camps in this country who were to organize and entrain these individual proportions in time to insure their being ready at a given date when the complete draft for the month would be assembled at a port of embarkation.

This system of replacement camps inaugurated in the spring of 1918 on the basis of the experience gained during the winter proved to be an adequate solution of the problem. Due to the fact, however, that the cantonments necessary for this purpose could not be obtained until the divisions which formerly occupied them had sailed abroad, it was impossible to put the practical details of the new system into immediate operation. Considerable alteration of the old cantonments was necessary, officers and instructors had to be trained for this special and important function, the raw recruits from the drafts of late spring and summer had to be assembled and given a certain minimum of military instruction before the replacement drafts could be drawn from the replacement camps alone. By early summer the new camps were able to furnish practically all of the combat troops for replacement, but after that date, due to the fact that the Allies had assumed the offensive which was pressed forward without cessation to final victory, the demands for replacements grew so great that it became difficult to take men in from the draft in adequate numbers to furnish the complete quotas, a situation further complicated by the influenza epidemic. By early fall orders had been issued which would have resulted in the wiping out of all past shortages in replacement troops, and would have supplied a steady flow of thoroughly trained men to meet future requirements, and notwithstanding the influenza epidemic, it was planned to make up all deficiencies by the end of November, 1918. The advent of the armistice, however, put a sudden end to all replacement functions. From January to November approximately 236,000 replacement troops had been shipped overseas. This was the equivalent of eight combat divisions or half of the entire National Army as originally assembled in 1917.

Conservation of man power.—Both in justice to our men and in order to make provision for sustaining the country's effort through 1920, or longer if necessary, every effort was made to conserve man power. Even with a new registration of all men from 18 to 45, and notwithstanding the accepting of volunteers for staff duty up to 55 years, in the spring of 1918 it became imperative that man power be fully utilized. As organizations were ordered overseas, a careful physical examination was made and all men found unfit for most arduous field duty were separated from the organization going overseas and left in camp. These men soon accumulated in large numbers in the camps and were taking up much needed camp space; they were retarding progress in training units for the front; they were

costing the Government a great deal of money, and they were not paying a dividend, so to speak. Something had to be done. The remedy found was the establishment of development battalions.

These units were organized in May, 1918. Within a month after their establishment, over 100,000 men had been transferred into these battalions. The men transferred had been originally brought into the service as physically fit for general military service, but on further examination had been found to have some defect which made it probable that they might not be able to stand the rigors of duty abroad, or which prevented them from being efficient soldiers. There were the flat footed, the enemy aliens, the non-English speaking, and illiterates; in fact all men who for some reason or other were not fit for combatant duty overseas. They did not belong in the hospital, yet they had to be cared for in some manner. In the development battalions the men were segregated and given specialized treatment or instruction for the purpose of fitting them for some useful work in the Army. Wherever one of these men could be used to do the work previously performed by a perfect man physically, he released such a man for combatant service overseas. From May to November, 1918, when these organizations were in operation, the battalions handled about 224,000 men. When the armistice was signed 129,000 men, graduates of the development battalions, had been assigned to useful duty, such as in clerical work, as overseers, and in various supply and administrative positions both in this country and abroad.

One of the interesting experiments conducted in the development battalions was the education of the great numbers of non-English speaking and the illiterates. By the use of modern methods for instruction in English it was found that in three months sufficient English could be taught to enable men to write letters home and to transmit simple messages. The experience thus gained in the development battalions system should be turned to account in obtaining men for our peace-time Army. With this idea in view, on May 1, 1919, the War Department began accepting for enlistment in a limited number, and for training at a recruit educational center established at Camp Upton, illiterates and non-English speaking citizens, a class which in peace time had been barred. The Army is now offering to these illiterates and non-English speaking, who enlist for three years, first of all a thorough course in English and, second, full citizenship upon honorable discharge, all in addition to military training, improved physique and opportunities for vocational training, and legislation has been recommended to Congress to authorize the continuation of this work, which should prove a valuable factor in the development of better citizens as well as of soldiers, of these people, after the termination of the emergency.

As has been stated, many men who were drafted as physically fit for general military service and who later proved to be unfit for this purpose, were passed through the development battalions and their services were saved to the Government. In addition to the above source of limited service men, on June 14 orders were issued to the various bureaus directing that there be drafted into the service the greatest possible number of men classified by their draft boards as not fit for full combatant service but available for special and limited military duties. This class of man was composed of those suffering

from defects of sight, absence of a few teeth, loss of a finger, etc., which rendered them unfit for first line service. Many of them averaged high intelligence and in mechanical skill.

The Provost Marshal General, about July 1, 1918, reported about 115,000 men available in this class. During the latter part of July a camp for such limited-service men was opened at Syracuse, N. Y. The first draft of 10,000 proved to be excellent material. Among those were thousands of clerks, stenographers, etc., who were much needed and who, it was found, were able to perform most useful and important duty. The first draft was quickly followed by a second and third.

The services of the limited-service men were so satisfactory that early in September the War Department policy was announced as follows:

In order to conserve the man power of the Nation, it is essential that every man who is physically fit for combatant service overseas be used solely for such service. Limited-service men must be used to the maximum extent for service both in this country and abroad. No general service men will be used in this country for any duty whatsoever which can be performed by limited service men.

Before the signing of the armistice 108,245 men classified by their local boards as fit for limited military service had been drafted into the Army.

Another step taken in the effort to conserve man power was the formation of the United States Guards. Previous to this time 12 regiments of Regular Infantry were being used to guard utilities such as railroad bridges, ammunition plants, wharves, etc. There had been the plan to have United States Guards which were to be recruited from volunteers beyond the draft age, perform the duties of guarding utilities. This plan had to be abandoned, for the time being at least, because recruits could not be obtained. Early in the summer of 1918, however, it was found feasible to revive the plan of organizing United States Guards because the product of the development battalions could be used in forming these organizations. In this way 25,000 of these men were used and the United States Guards, thus reinforced, replaced the regular regiments on utility guard duty at home, and released them for combatant duty overseas.

Final system of mobilization.—The work of a modern army requires that there be within its ranks men skilled in very many different trades. To provide and properly assign these men and at the same time disturb to a minimum the essential industries of the country, required the intricate machinery described. The final system was not put into effect at one time, nor was it originally conceived as a whole and adopted as a new project. The methods it used had been developed, partly in the camps, partly in the staff, throughout the winter. But as each new method arose in any cantonment and proved its value, it was quickly extended by the staff to the entire system. This resulted in a complete scheme for the organization of millions of civilians into a great army in the minimum of time and in the most efficient manner, founded not upon theory alone, but on actual experience and practice as well.

The chart on opposite page illustrates the general scheme of the final organization described.

Shipment of troops overseas.—An Army consisting entirely of Infantry, or entirely of Field Artillery, or Engineers, no matter how important the particular branch, could not function. Combat troops could not survive without the necessary auxiliaries for their maintenance and replacement, which are as necessary to the fighting troops as ammunition and bayonet to the rifle. It was, therefore, necessary that the kind of troops arriving overseas come in a certain order so that the Army should at all times be properly balanced. These requirements were met by Gen. Pershing's schedule of priority shipments of October 7, 1917, to which reference has already been made, and by amendatory cables. The maintenance of this regular schedule of troops, composed of units differently organized, equipped, and trained, required a complete coordination; otherwise endless confusion would have resulted. The men had to be mobilized and organized with the kinds of units wanted overseas at the time their periods of preliminary training should elapse; the supplies of clothing and equipment must be so adjusted that units not then scheduled for shipment might not have surpluses while those designated for departure lacked these things; sufficient transportation, both railroad and ocean, had to be available at the right times and places and troops and supplies had to be so assigned to ports and ships that no wastage of facilities should occur.

The preparation of a priority of equipment schedule, based on the priority of shipment schedule and constantly modified from time to time was thus made necessary. This schedule indicated in its proper order each unit to be shipped overseas for several months in advance and enabled the Supply Departments to concentrate on organizations in such manner as to prevent the issue of overseas equipment to troops not scheduled for immediate overseas service. Commanding officers of units about to sail which had not received their full equipment were required to forward periodic reports to the Overseas Priority and Troop Movement Section of the Operations Division showing when, where, and to whom they had submitted requisitions. These reports were then furnished to the liaison officers of the Supply Departments, and were traced back through the various channels of supply until the necessary articles were located and forwarded. In order to meet changes in the situation abroad, it occasionally became necessary to move troops from the mobilization camps to the ports without their complete equipment. In such cases lists of shortages were forwarded by wire to the Operations Branch which transmitted them through the liaison officers of the Supply Departments, and the necessary articles were supplied to the ports themselves without delaying the movement of the troops overseas.

The priority established for the shipment and equipment of troops also established the priority of supply in personnel to the organizations to the end that troops first to go overseas would be the first to complete their organization, training, and equipment.

The priority schedule also served as a guide for the Embarkation Service as it indicated the order in which troops should be called to the ports for shipment after they had reported their readiness therefor.

All troops were advised as nearly as it was practicable to do so of the approximate time when it was intended to ship them overseas in order that their program of training might be adjusted accordingly.

In the event of change, ample notice was usually given. Supply Departments were advised regarding all troop movements.

In order to insure an ample supply of troops at the ports, not only to fill all transports to capacity but in order that there might be an ample reservoir of troops as a reserve at the ports to guard against emergency, programs were prepared from time to time showing the troops that were scheduled for shipment overseas together with the contemplated dates of their movement from mobilization camps to ports. These programs, made after conference between the embarkation officials, the Inland Traffic Service (now Transportation Service), and the Operations Division, General Staff, usually covered shipments from camps to ports for a period of one month in advance.

The movements of the troops to the ports were so timed as to fit in with all other rail movements throughout the United States so as to avoid congestion and an excessive demand for equipment during a limited period.

The program gave the supply bureaus definite dates for the completion of equipment at mobilization camps, thus enabling them to stop shipments to these points that would arrive too late, or to direct them, if necessary, to the port.

The various corps and arms concerned, the supply bureaus, the Transportation Service, Inland Traffic Service, and the organizations at the ports of embarkation did the actual work involved in execution of orders, but coordination of all the intricacies of their work devolved upon the Operations Division.

The following table shows the rapid increase from month to month in troop shipment overseas during 1918:

	U. S. Army.	U. S. Marine Corps.	Total.
1918.			
January.....	46,708	1,089	47,797
February.....	48,009	1,087	49,096
March.....	83,785	1,081	84,866
April.....	117,203	1,432	118,635
May.....	244,211	1,606	245,817
June.....	277,897	778	278,675
July.....	306,295		306,295
August.....	281,461	4,392	285,853
Total.....	1,405,569	11,465	1,417,034

The functions of the Operations Branch in connection with the demobilization of the Army, with which this branch was to a very considerable degree charged, are indicated elsewhere in this report in connection with the subject of demobilization. These functions were of at least as great importance and complexity as those connected with the mobilization of the Army, which are above outlined.

THE EQUIPMENT BRANCH.

While under the peace-time régime the General Staff had no responsibilities in the technical details of procurement, it was very directly concerned in the type and selection of the articles to be procured, and in the distribution and issue of the articles after they

had been procured. These matters directly affected the training of the troops and their eventual combat efficiency. Prior to the war the question of the type of equipment to be used by troops and the allowances for them was kept almost entirely in the hands of the different supply bureaus. Aside from such special boards of officers as might be convened from time to time, there was no provision for any central representative body to ascertain the exact needs of the combat troops and to insure that these needs would be met by the various supply departments. The logical organization to perform these duties, which indeed should form an essential part of its purpose of coordination and supervision, was the General Staff.

The Equipment Committee was accordingly formed in the War College Division at the beginning of the war. To this committee was given general supervision over the design and adoption of types of equipment and over its standardization, distribution, and issue. Due, however, to the impossibility of coordination between the various parts of the Army without a radical change in its entire organization, the greater part of this work was performed in the individual bureaus, both before and for some months after the declaration of war. The bureaus adopted equipment, conducted researches, and decided on the armament of the combat troops in general independently of the line of the Army or of the General Staff. The function of the Equipment Committee was largely advisory in its early development.

On the reorganization of the staff in February, 1918, the Operations Committee and the Equipment Committee together formed the basis of the new Operations Division. This reorganization had also begun a better definition of supply functions in general by creating the Purchase and Storage Division and the Storage and Traffic Division. These new divisions took over supervision and coordination of the tasks of procurement and transportation, and the Equipment Branch was charged with all matters of approval of designs and types, with the research connected therewith, and with supervision of the distribution of all equipment and the determination of priority in such distribution.

In addition, supervision over all questions of camp sites and construction were assigned to this branch. The construction at camps, cantonments and posts was a technical problem in its execution, and as such was handled by the Construction Division of the Army. The selection of sites, the amount and nature of construction, however, were important factors in the present and future distribution of troops; and the necessity of a central agency within the General Staff to supervise these matters led to the creation of a Construction Section in the Equipment Branch which coordinated all construction activities.

An Equipment Section handled all matters of approval of design for equipment, the research connected with it, and the basic allowance of all articles for the different Army units. This included investigation of new types of equipment, such as trench mortars, trench knives, harness, the new field shoes, the new method of fitting shoes, fire control equipment for machine guns, for railroad artillery, for anti-aircraft artillery, the standardization of motor vehicles and the changes which were made in uniforms in order to assist procurement.

A Miscellaneous Section was formed to care for the distribution of material, questions of rations, commutation, baggage allowance, etc., and to cooperate with the Operations Branch in planning any movement of troops by insuring that the proper bureau or supply branch was informed, in order that the distribution of material and the necessary transportation might be arranged.

In the early part of 1918 and until the establishment of the Purchase and Supply Division, the Equipment Branch was occupied in efforts to assist the procurement of the equipment which was being called for by the Expeditionary Forces. This task necessitated the preparation of tables of allowances for use in training in this country, and amounts to be transported overseas; the preparation of artillery procurement programs for the Ordnance Department; studies of the possible use of coast defense guns as mobile Army artillery, etc., etc.

After April, 1918, the Equipment Branch was charged particularly with the solution of the question of priority of equipment in connection with the rapid movement of divisions to France.

In addition to these duties studies were made of the "automatic supply" system; the question of reserve stores to be considered in calculating requirements; and in general all questions of supply which could aid or expedite the dispatch of troops abroad were studied in this central branch, as well as by the operating services themselves.

It has long been a standard rule for military operations that troops should be embarked on shipboard as organizations and carrying with them their full equipment together with supplies for a certain period of time, depending upon the conditions existing; furthermore, that the equipment and supplies should be loaded on board in such a manner that those needed first on disembarkation will be the first to be unloaded. In this way an expedition can be transported to a hostile shore and on effecting a landing the organization is complete, both in personnel and equipment, and able to undertake at once operations against the enemy.

In our first movements of troops to France, endeavor was made to follow the same principle, but it was soon found impossible to adhere to it, nor was there the same necessity that exists when landing in a hostile territory. The principal difficulty confronting our expeditions was not that of making a landing on the other side, which would have been the case had the landing been opposed, but was the lack of shipping to transport troops and supplies which were necessary for the operations in France. This made it incumbent to take advantage of every ton. Each vessel had to be loaded to its maximum capacity in order to transport the greatest amount with a given tonnage. Transporting organizations as complete units and with their full equipment and supplies is very wasteful of tonnage space. A further consideration was that we pressed into service ships of all types, some passenger ships which had no place available for the carrying of supplies and equipment, some cargo ships which were unable to take personnel. Consequently, very early in our movements it became necessary to send troops on one ship and their equipment on another. At this time the French ports had not been built up and the railways leading from the ports to the interior were

•

badly congested, and as the troops and the equipment frequently went to different ports, the result was that they rarely got together in France.

This necessitated the adoption of a policy of entirely separating the baggage from the troops. The personnel was sent with the equipment which they carried on their persons or could store in the baggage room or ship's hold, the latter being limited to organizational records, bedding rolls, etc. The remainder of the equipment for the troops was sent on a separate cargo vessel and upon arrival in France no effort was made to supply that particular equipment to the organization which had used it in the United States. Instead, it was all pooled and issues were made from the pool to organizations as they needed supplies. So far as the shipments were concerned, this worked well but a later development came in that it was decided that additional tonnage could be saved, and also railroad transportation in this country, by sending across only new equipment direct from the factories. When a division was ordered from its training camp for oversea duty it then left the equipment which it had been using (except that carried on the person) in the camp, to be turned over to the new organization to be formed and assigned thereto. Upon its arrival in France it received a complete outfit of new equipment which had been sent over in bulk for that purpose. In this way the equipment lasted longer after reaching France, and therefore did not require replenishing so frequently, and the amount of railroad shipments in the United States was reduced. In this way the capacity of every ship was utilized to full advantage.

The work of the Equipment Branch in connection with the formulation of policies governing the disposition of surplus supplies and equipment, after the signing of the armistice, is referred to elsewhere in this report in connection with the subject of the demobilization of the Army.

Hospitalization.—The Equipment Branch was also charged with the general supervision of the hospitalization project. Before the United States entered the war the provisions for the care of sick and wounded consisted of those at the few general hospitals and the regular post hospitals scattered throughout the country, in all a little over 6,000 beds, which were of course needed entirely for the Regular Army as it then existed. Immediately after the declaration of war and the passage of the selective-service act, active steps were taken toward increasing the hospitalization. The Council of National Defense had already been in existence for some time and comprised a Medical Section which had compiled a great mass of statistics which proved of great value to the General Staff in formulating policies. From these statistics a good working knowledge was obtained of medical conditions in civil life, such as the hospitalization in the various medical centers, the amount of the same which could be spared for Army purposes, the proportion of doctors which should be left in civil life in the various communities, and other matters of that nature which were essential in order to avoid the disturbance of civilian conditions more than was necessary.

The first problem was to provide immediately bed space for the increased Army. Base hospitals were built in the various cantonments, one of which was located in each of the draft areas, but this

was not sufficient. Provision had also to be made for the sick and wounded who would be returned from France. The policy was adopted that patients should not be sent back to this country except where their recovery would be slow. In all cases where a comparatively early return to duty was looked for, they were to be retained in the hospitals in France. Nevertheless, it was known that as our forces became actively engaged large numbers would have to be provided for on this side, and the policy was adopted of providing general hospitals for such patients, distributed throughout the country in order that these wounded soldiers could be placed as near as possible to their homes. This was highly desirable as it enabled them to be within reach of their friends and relatives, and it also would provide a place to which they could come periodically after discharge if their conditions were such as to require further treatment or observation.

The immediate necessity of suddenly providing a large increased hospitalization precluded the carrying out of this policy at the beginning. It was essential to provide beds as soon as possible, and therefore existing structures had to be taken wherever found and converted into hospitals. The result was that in the beginning it was impracticable to observe this policy, but as the war proceeded and the immediate needs were taken care of, boards of officers representing the Surgeon General and the construction and real estate activities visited all parts of the United States with a view to establishing additional hospitals in the areas not sufficiently provided for at the beginning. Had the war continued a few months longer this plan would have been completed, as at the time of the armistice it was practically perfected.

Among the other methods adopted early in the war to provide for the immediate requirements, several Army posts were converted into general hospitals, the troops being withdrawn from them to the different camps and cantonments. Forts McPherson, Oglethorpe, and McHenry were turned over completely to the Medical Department, and a large portion of Forts Logan H. Roots, Benjamin Harrison, Sheridan, Snelling, Des Moines, Ontario, and Madison and Plattsburg Barracks. Fifteen hospitals were also provided for the treatment of special diseases, such as tuberculosis, insane cases, etc. During the influenza epidemic in the fall of 1918, emergency beds were provided by temporarily utilizing barracks and other structures. Omitting these temporary facilities the maximum bed capacity of 110,059 was reached shortly after the armistice.

In estimating the number of beds that would be required, the experience of our Allies, particularly the Canadians, was largely drawn upon. The situation of Canada was almost identical with that of the United States, and consequently the experience which they had had in the three years preceding our own activities was of great value. Based on those figures it was estimated, at the time the armistice was signed, that the maximum required would be approximately 80,000, and that this would be reached on or before February 1, 1919. As soon as the armistice was signed, sick and wounded in France who would have been retained there had the war continued were sent to the United States to await complete recovery. This more than offset the decrease in the United States caused by demobilization, so that the maximum number of beds occupied was reached about the be-

ginning of January and was somewhat less than the 80,000 estimated. It will thus be seen that our provisions gave a safe margin over the actual requirements.

Welfare buildings, rest and recreation rooms, and community houses were also erected to offer every comfort to the inmates of the hospitals and to permit of their friends and relatives visiting them.

While provision was made by Congress for the reconstruction and rehabilitation after discharge of the wounded soldiers, through the agencies of the Federal Board for Vocational Training and the Public Health Service, the soldier was first brought to a point of maximum recovery before discharge. In order not to waste time during this period of physical treatment and having regard for the therapeutic value of vocational training, 24 curative shops were established in which the wounded man could be given preliminary training after the actual wound was cured but before being brought to the point of maximum recovery. On reaching that point he was discharged from the Army and taken in hand by the civilian agencies above mentioned for the further prosecution of his training.

When the armistice was signed, the final plans for hospitalization were being formulated and projects involving the expenditure of \$14,052,968 were then, or shortly afterwards, under consideration. The expenditure of only \$4,503,285 was approved, and of this amount about one-half represented overruns in previously authorized projects. Very little new construction was, therefore, authorized and large amounts which had been approved prior to the armistice were immediately ordered discontinued. Subsequent events have fully justified the action then taken.

In January, 1919, arrangements were at once begun for the reduction of hospital facilities, and many of them have been turned over to the Public Health Service for the treatment of the former soldiers who are entitled to further reconstruction and rehabilitation. This demobilization is now proceeding fast and it is estimated that by September, 1920, all temporary hospitals will have been abandoned and only the permanent structures will remain in use.

Construction demobilization.—Immediately upon the signing of the armistice there was organized in the Equipment Branch a committee known as the Construction Demobilization Committee, to investigate the status of all construction work built for the operations of the Army and to make recommendations with reference to each existing project as to whether it should be entirely abandoned, completed in a modified form, or completed as originally authorized. In this connection representatives of each bureau and department concerned were called into conference.

As a result of these conferences, on the 31st of December, 1918, the committee had acted upon practically all existing construction work under the supervision of the Operations Division of the General Staff and had recommended for completion 28 projects, for suspension 107 projects, and for abandonment 483 projects. It is estimated that the amount of money saved by suspending and abandoning these projects totaled \$121,000,000.

The committee also took up the study of the disposition of the various training camps then in existence in the United States and its possessions. These camps were classified into National Army

cantonments of which there were 16, National Guard camps of which there were 16, aviation flying fields and balloon schools of which there were about 36, and miscellaneous camps, a list of which is included herein.

National Army cantonments.—Of the 16 National Army cantonments, 2 (Camp Lewis, Wash., and Camp Funston, Kans.) were constructed on land owned by the Government. The remaining 14 camps were either entirely or partially on leased land. A list of these camps is given below.

Shortly after the signing of the armistice the Director of War Plans Division, the Chief of the Construction Division, and the Director of Operations instituted studies as to what action should be taken with regard to the National Army cantonment sites. These studies developed the fact that it would cost the Government almost as much to pay the rental on these areas for the period of demobilization and salvage and to pay land and property damage claims as it would to buy the land outright and thereby obviate the payment of rentals and damage claims and in addition secure the fee to valuable land on which was constructed improvements which cost more than \$190,000,000.

It was recommended that the War Department purchase the cantonment sites rather than pay rental and damage claims. The matter was taken up with the Military Affairs Committees of the Senate and of the House and discussed with these committees. No action having been taken by Congress providing for the future military policy of the United States when it adjourned on March 4, 1919, the Assistant Secretary of War on March 20, 1919, issued instructions to complete the purchase of those areas at the National Army cantonment sites which were necessary for the operation of the cantonment and on which damages had been sustained equal or greater than one-half the cost price of the land.

There was forwarded to the commanding general at each camp a map showing the maximum area to be authorized for purchase, and he was directed to organize a board of three officers to examine the ground in detail and make recommendations as to what areas could be eliminated from purchase, in order to save money. These reports were received by April 15, 1919, and were carefully considered by the Construction Demobilization Committee. The acreage involved and the estimated costs of the purchases directed as the result of this study are as follows:

Camp.	Acreage.	Cost to buy.	Camp.	Acreage.	Cost to buy.
Custer.....	9,169	\$675,000	Lee.....	7,160	\$900,000
Devens.....	4,789	210,000	Meade.....	7,770	700,000
Dix.....	7,040	700,000	Pike.....	2,574	210,000
Dodge.....	3,050	750,000	Sherman.....	4,980	1,150,000
Gordon.....	2,770	750,000	Travis.....	729	260,000
Grant.....	3,780	900,000	Taylor.....	2,010	1,150,000
Jackson.....	19,308	500,000	Upton.....	6,183	200,000

In the Army appropriation bill for 1920 Congress indicated its approval of the above action by authorizing the completion of the purchase of the camp sites.

National Guard camps.—Shortly after the signing of the armistice a study was begun of the National Guard camps. There were 16

of these camps, namely, McClellan, Kearny, Cody, Fremont, Greene, Hancock, McArthur, Wadsworth, Wheeler, Logan, Sevier, Sheridan, Doniphan, Beauregard, Shelby, and Bowie. In December, 1918, orders were issued to the respective commanding generals to convene boards of officers to assess the value of the land and the amount of damages which the Government would have to pay upon abandonment. All of the camps except Doniphan and McClellan were constructed on leased land, and in most of the leases it was provided that the United States should restore the land to its original condition or pay for the injuries to the land.

In February and March the reports from the boards were received. Their labors had so reduced the total of the damages claimed at most of the camps that it appeared to be clear that it would be better to pay the damages than to buy the land. In the majority of cases a satisfactory basis of settlement was arrived at with the owners. At only one camp (Sevier) was there an entire failure on the part of the board and the property owners to get together.

Camp Greene was early abandoned and sold to a local corporation consisting of the property owners themselves. By this sale the Government automatically wiped out the damage claims and rentals. Camps Cody, McArthur, and Fremont were salvaged by the Construction Division of the Army; some of the buildings were sold at auction, others, especially at Camps Cody and McArthur, were salvaged and the material used in constructing accommodations for troops along the Mexican border. Camp Kearny was retained, due to its strategic location and exceptional training facilities.

By March demobilization at the remaining National Guard camps had progressed sufficiently to warrant steps to be taken to dispose of them. Camps Bowie and Shelby had been designated as demobilization centers and had to be retained for that purpose throughout the summer. On March 21, 1919, the Secretary of War authorized the sale of the surplus National Guard and certain miscellaneous camps by sealed proposals.

As the result of the proposals received, following the nation-wide advertisements, it was decided that the bids on six of these camps, namely, Bowie, Hancock, Logan, Sheridan, Wadsworth, and Wheeler should be accepted as satisfactory. Camp Beauregard was sold to the highest bidder on the condition that he donate to the State sufficient buildings for a National Guard camp, desired by the State of Louisiana. Camp Sevier was later sold without the assumption of damage claims.

In considering the returns received from the sale of these camps, the cost of the original construction can not in any way be taken as a criterion. The camps were all tent camps and the only buildings approaching substantial construction were the warehouses and the hospitals. In all cases except Wadsworth and Greene, the warehouses were reserved, and four of the hospitals were held out to be transferred to the Public Health Service of the Treasury Department. The other buildings, chiefly mess halls, were the merest shells in which the lumber had been cut into small pieces for their construction. The underground part of the camp, which was the most costly, consisted mostly of pipe not worth in salvage value the cost of digging up. The roads, drains, and ditches of course are valueless

from the salvage point of view. The movable stores, telephones, fire-fighting apparatus, refrigerators, refrigerating machinery, incinerator plants, laundry equipment, tents, and other equipment were not included in the sale. In brief, what was sold was the lumber and the pipes in the ground. The expense of removing these, borne by the purchaser, is very large in proportion to the value of the material obtained.

These camps were built for the training of troops and represented that part of the Army housing scheme of the most temporary nature. They were designed purely to meet military requirements and without any relation to their future salvage value. They were constructed in great haste at war prices for labor and materials. Under these circumstances the entire cost of the camps may reasonably be charged off against the operating expenses in training troops. These camps served their purpose in training. On the basis of the camps being filled only twice, 800,000 troops were trained in them at a cost for the construction part of the work of about \$30 per capita. The problem was not one of how much to depreciate the original cost of the camps in order to obtain the proper sale price but how much would the purchasers give for materials that were useless to the Government.

Flying fields.—Simultaneous with the study on the National Army cantonment sites a study was made in cooperation with the Director of Air Service as to the disposition of the various aviation and balloon fields acquired by the War Department during the period of the war. As a result of this study it appeared that all of the fields would be required for from one to three years for the purpose of storing valuable Air Service equipment in this country and to be returned to this country.

As there had been practically no Air Service fields prior to the war, it was necessary to retain sufficient fields for the needs of a service the size of which could only be estimated.

Four fields—Rockwell, at San Diego, Calif.; Langley, at Hampton, Va.; Post Field, at Fort Sill, Okla.; and Kelly No. 1, at San Antonio, Tex.—were owned by the Government, and it was recommended that they be retained for military purposes.

In addition, March Field, Riverside, Calif.; Mather Field, Sacramento, Calif.; Carlstrom Field, Arcadia, Fla.; Dorr Field, Arcadia, Fla.; Ellington Field, Houston, Tex.; Kelly Field No. 2, San Antonio, Tex.; Park Field, Memphis, Tenn.; Souther Field, Americus, Ga.; Selfridge Field, Mount Clemens, Mich.; Chanute Field, Rantoul, Ill.; and Scott Field, Belleville, Ill., were recommended for retention. Their purchase was approved by the Assistant Secretary of War on March 3, 1919.

The above fields give a total of 12 single-unit and 2 double-unit flying fields for heavier-than-air training and operations. The capacity of the 16 units is approximately 18,770 officers and men but can be expanded if necessary. Later Mitchell Field, Long Island, N. Y., and Chapman Field, Miami, Fla., were added to the list of purchase. Mitchell Field was selected because it was advantageously located for the aerial defense of New York City and vicinity, for which purpose no other provision had been made. On account of the large amount that had been expended by the Government for

drainage and improvements, and on account of the excessive claims of the land owners, it was deemed to the best interests of the Government to purchase Chapman Field, with a view to resale.

For the lighter-than-air training the balloon fields at Lee Hall, Va., and Forts Crook and Omaha, Nebr., were on Government-owned land and were recommended for retention. The purchase of the fields at Arcadia, Calif., and Brooks Field, San Antonio, Tex., was authorized. The four fields are conveniently situated geographically, giving one balloon school on the eastern seaboard, one in the Central Department, one on the Pacific coast, and one in the Southern Department.

For general repair work the engine and repair depot at Montgomery, Ala., was selected and the land purchased.

Gerstner Field, La.; McCook Field, Ohio; and Camp John Wise, Tex., were ordered abandoned. The remaining fields it was found necessary to hold temporarily for storage purposes. They are: Wilbur Wright, Dayton, Ohio; Taylor, Montgomery, Ala.; Payne, West Point, Miss.; Eberts, Little Rock, Ark.; Call, Wichita Falls, Tex.; Rich, Waco, Tex.; Love, Dallas, Tex.; Barron and Carruthers, Fort Worth, Tex.; and Hazlehurst, Long Island, N. Y. Bolling Field, Anacostia, D. C., is on Government-owned land allotted for park purpose and is being retained temporarily.

The following miscellaneous camps, which were in various states of construction when the armistice was signed, were either abandoned or sold or completed on a reduced basis:

Name.	Location.	Purpose of the camp.	Action taken.
Benning.....	Columbus, Ga.....	Infantry school.....	Completed on a reduced basis.
Bragg.....	Fayetteville, N. C.....	Artillery firing center.....	Do.
Knox.....	West Point, Ky.....	do.....	Do.
Vall.....	Little Silver, N. J.....	Signal Corps school.....	Real estate purchased.
Humphreys.....	Accotink, Va.....	Engineer school.....	Do.
Holabird.....	Baltimore, Md.....	Motor transport school.....	Do.
Jessup.....	Atlanta, Ga.....	do.....	Completed and retained.
Normandy.....	San Antonio, Tex.....	do.....	Do.
Eustis.....	Mulberry Island, Va.....	Coast Artillery school.....	Do.
Polk.....	Raleigh, N. C.....	Tank school.....	Abandoned and sold.
Colt.....	Gettysburg, Pa.....	do.....	Do.
North Camp Jackson.....	Columbia, S. C.....	Artillery firing center.....	Do.
Kendrick.....	Lakehurst, N. J.....	Chemical warfare school.....	Do.
Johnston.....	Jacksonville, Fla.....	Quartermaster school.....	Retained for possible future use.
Crane.....	Allentown, Pa.....	Medical school.....	Abandoned; and sold.
Syracuse.....	Syracuse, N. Y.....	Recruit camp.....	Do.
Forrest.....	Chickamauga Park, Ga.....	Engineer camp.....	Do.
Leach.....	Washington, D. C.....	do.....	Do.
Mills.....	Garden City, N. Y.....	Embarkation camp.....	Abandoned: to be sold.
Stuart.....	Newport News, Va.....	do.....	Do.
Hill.....	do.....	do.....	Do.
Alexander.....	do.....	do.....	Do.
Merritt.....	Englewood, N. J.....	do.....	To be abandoned and sold.

Army posts and reservations.—A study was also made of the military posts and reservations situated in the United States. All available information as to size of the posts in acreage and accommodations for troops, transportation facilities, training facilities, and general value for military purposes is available for use as soon as the future military policy of the Government is definitely determined. It is possible that the use of the National Army canton-

ments will make possible the sale or disposal of a number of these posts, but until such decision is reached no definite recommendations can be made. .

Such temporary construction on posts, reservations, and other Government-owned land as can not be used in peace time is being torn down and salvaged, in order to avoid deterioration and fire hazard.

THE PERSONNEL BRANCH.

Prewar conditions.—A general survey of the activities of the War Department in matters of commissioned personnel, both before and during the war, reveals many defects. There was much lost motion, lack of settled policies, and a very limited application of the qualifications and efficiency of officers in matters pertaining to assignment and duties. There was no general supervision of the procurement of commissioned personnel for the Army. In those bureaus having a chief there was some supervision over commissioned personnel, but each bureau followed its own course with little relation to any other and to the line of the Army. It was apparent from conditions existing that there was an urgent need for general supervision over the commissioned personnel of the entire Army.

At the outbreak of war the country had approximately 5,950 Regular Army officers (of whom 650 held provisional appointments), 3,150 officers of the Reserve Corps, 3,200 National Guard officers in State service and National Guard Reserve, a total of 17,750 officers of all kinds, of all degrees of training, and with no proper balance as to rank or arms. There was no comprehensive system for the expansion of this small nucleus to meet the demands of war. The expansion did take place during the war by improvised and uncoordinated means until at the time of the cessation of hostilities we had approximately 200,000 officers. Military efficiency, however, was hampered by the supply of officers constantly lagging behind the demand.

As with procurement, so with the transfer and assignment of officers. There was little general supervision and each arm or activity was competing to get the best regardless of other necessities.

So far as regular officers were concerned, there was no comprehensive tabulation of reports upon their efficiency or qualifications and their selection for various commands and duties was necessarily based upon the personal knowledge of officers, rather than upon the dormant, incomplete, and scattered reports on file.

Promotions in the Regular Army were, of course, governed by law. Promotions for the emergency were not properly controlled or coordinated in the absence of an organized controlling agency. Recommendations from many unrelated sources had necessarily to be accepted at their face value and approved.

The unsatisfactory conditions with respect to commissioned personnel had become more and more acute during the war and, with the enlargement of the military program, gave promise of leading to most serious difficulties unless all matters of procurement and distribution of officers were promptly brought under general control and supervision. This control and supervision are properly functions of the General Staff, and require a well organized branch for

that purpose. The procurement, control, and administration of personnel in the Army, as in an industrial organization, must be functionalized and given the individual thought and energies of individuals fitted for the task and can not satisfactorily be left as incidental tasks to officers charged with a multitude of other duties.

Establishment of Personnel Branch.—General Orders, No. 8, prescribed that the Operations Division should have cognizance and control of the appointment, promotion, transfer, and assignment of the commissioned personnel of all branches of the Army. On September 18, 1918, General Orders, No. 86, were issued which established the Personnel Branch and directed that all staff corps and departments would, after that date, submit requisitions to the Operations Division, General Staff, "for the number and kinds of officers needed for any particular organization or duty." General Orders, No. 86, abolished the commissioned personnel branches of the various staff corps and departments, as they had been operating before that date, and directed that their functions and personnel be taken over into the Commissioned Personnel Branch of the General Staff. During the period of transition, however, those branches for the time were kept intact and continued to function under instructions received from the Personnel Branch.

The enlarged military program, the speeding up of all activities, and the necessity for developing an entirely new organization from the limited personnel available at the time, as well as a lack of data, made the prompt and efficient organization of this branch a difficult matter.

One of the first steps was the creation of a Promotions and Assignments Section, which undertook at once the supervision of assignments and promotions for the whole Army. This section handled almost from the start several hundred cases a day bearing on personnel matters.

Work during war.—When the Personnel Branch was created there existed about 40,000 vacancies in commissioned officer grades in the staff departments to be filled without delay.

Strenuous efforts were directed to the immediate organization of the Procurement Section, whose function it was to secure commissioned personnel for the entire Army; to be able to fill requisitions from all branches of the service. During the month of October the organization of this section was laid out, personnel was assembled and instructed, and a nation-wide plan of recruiting was perfected, involving the establishment of central offices in 12 of the largest cities in the United States. The United States was, in this manner, divided into districts, so that the whole of the country was systematically covered in the recruiting efforts. The Military Training Camps Association, which had done a great deal of useful work for the War Department in procuring candidates for training camps and had established itself as an organization having the confidence of the country, was turned to for assistance. The patriotic and practically helpful assistance of the latter organization was of great value in the beginning of the work.

While the recruiting organization was being perfected, a system of classification of applicants was devised and arrangements were made with the various staff corps to submit requisitions for officers,

giving in each case specifications as to the qualifications desired. This system of classification was worked out in minute detail and was so arranged that any type of requisition could be filled immediately by reference to the classified file of applicants who had passed all the required tests and were qualified for appointment. A standard blank form of application for appointment in the Army was devised and the many blanks of differing types that had been used previously by the staff departments were discarded.

In a very short time the organization was in operation and by November 11, 1918, applications were being received at the rate of 400 per day, with the daily number rapidly increasing. Results indicated that the system was sound, that this centralized procurement should be a great improvement over the former method of each staff corps acting independently and would result in assignments according to qualifications.

The system of training schools in operation appeared to be functioning well, so far as material for the line of the Army was concerned. The Student Army Training Corps was also well established and gave promise of supplying additional material. These activities would, of course, in time have been incorporated in the general procurement system. Under the stress of filling the staff corps vacancies, this incorporation was deferred for the time being.

Work since armistice.—The work of the Personnel Branch was well under way when hostilities terminated. The problems of demobilization had to be solved at once and the actual discharge of officers and men begun. Difficult as the creation of an Army may be, the tearing down and shaping of it into a peace-time organization is even more difficult. The existence of such agencies as the Personnel Branch as a part of the General Staff was a most fortunate circumstance, as it made available an organized and trained personnel to carry out the policies of demobilization.

The organization of the Procurement and Discharge Section was immediately reversed on November 11, 1918, to handle matters pertaining to the demobilization of commissioned personnel. Policies governing the discharge of emergency officers were drawn with a view of causing the last officers to be discharged to be those who desired appointment in the permanent establishment and who, as a result of preliminary examinations, were recommended by their commanding officers to be finally examined for such appointment. There were approximately 200,000 officers in the Army on November 11, 1918. All of these officers had had valuable training and experience, either in France or in the United States, so that the United States found itself equipped with a larger reservoir of officers with military training than ever before in its history.

It being desired to take full advantage of this potential reservoir of trained officers, attention was given at once to the building up of a Reserve Corps of merit, and to the classification of emergency officers, with a view to selecting the best of these for future vacancies in the permanent establishment. At the writing of this report about 45,000 officers have been appointed in the Reserve Corps. The lack of trained emergency officers, available for call at the outbreak of the war, demonstrated clearly that a greater reserve of officers than we have had in the past must be maintained. One of the most important functions of the personnel branch is to superintend the

building up and the maintaining of an adequate reserve of officers, with a view to making it possible for the Government to mobilize at once, in the event of another war, the military population of the country of the officer class, and fit it into the fighting machine to the greatest possible advantage.

Experience indicates that in time of war approximately 50,000 officers will be required for each million enlisted men. In the absence of a determination of the future military policy of the country, tentative plans are under consideration for providing the necessary officers for an emergency army of 3,000,000. This means a reserve of approximately 150,000 officers. Of the appointments already made in the Reserve Corps, approximately 37,000 are of former emergency officers, and from data now available it appears that when the demobilization of commissioned personnel is completed about 75,000 trained Reserve officers will be enrolled from this source. The remaining 8,000 appointees are graduates of officers' training schools and applicants for Staff Corps appointment whose actual appointment in the emergency army was prevented by the termination of hostilities.

The general policy being followed in Reserve Corps appointments is to place the appointee in the position in which his active services terminated. Appointments in general are in the grade held at the time of discharge, an advance of not to exceed one grade being granted in those cases in which a record of special fitness or of a recommendation for promotion indicate that at the termination of hostilities promotion was imminent.

The records of each officer who requested, at the time of discharge, appointment in the Reserve Corps, are carefully examined and none but professionally and physically qualified officers are appointed. About 8 per cent of the applications have been disapproved. These disapprovals are indicative of faulty procurement during the war and of incompleteness of records of emergency officers.

The organization of the Reserve Corps and appointments therein are governed by the national defense act of 1916. Unfortunately, this act was not so framed as to provide for taking full advantage of a reservoir of trained material such as now exists. The act places a limiting age upon appointees of 45 years except in a few of the staff corps sections. It also fixes certain ages beyond which officers may not be appointed to certain grades and fixes the grade of major as the highest grade in all sections, except the Medical Section. A departure from these limitations was desirable and possible in making emergency appointments during the war. The limitations must be observed in making all inactive appointments and have proved most embarrassing to the War Department and to many excellent emergency officers who can not be appointed at all, or must accept a grade much lower than that attained by them during their active service. Recommendations for relief from this situation have been made to Congress and it is anticipated that a provision in the Army appropriation bill when passed will remove the limitations as to age and grade. If this occurs steps will be taken to at once adjust the appointments of those officers who have suffered under the limitations of the present law.

Numerous new services, such as the Air Service, Motor Transport Corps, etc., have been developed during the war. The national defense act does not authorize corresponding sections of the Reserve Corps. Until Army reorganization is determined, it has been deemed inadvisable to request authority from Congress to establish new sections of the Reserve Corps. Officers who served in these new staff corps are being held available for service by commission in an authorized section of the Reserve Corps with a notation on their records that they are for duty of a particular kind. For example, former Motor Transport Corps officers are being commissioned in the Quartermaster Reserve Corps for motor-transport duty only.

In addition to procurement for the Reserve Corps steps have been taken toward the procurement of material to fill, from the reservoir of war-trained material, such vacancies in the permanent establishment as now exist, mainly as a result of resignations, and as may be created in the reorganization of the Army. Early in December instructions were published giving opportunity to all emergency officers who so desired, to submit applications for permanent appointment. These instructions provided that applicants be given a preliminary examination and be rated by boards of officers and their applications be forwarded to the War Department for file. There have been received, classified, and filed to date about 25,000 such applications, 15,000 of which have been approved so far as the preliminary examination is concerned. From the data available it appears that a total of at least 27,000 such applications will be received, about 17,000 of which will have the approval of preliminary examining boards. Final examinations can not, of course, be held until the enactment of legislation reorganizing the Army, creating vacancies, and establishing the eligibility requirements and procedure for appointment.

Although examinations can not be held, working plans for the preparation of examinations and the conduct of examinations have been developed so far as the uncertainty as to legislation permits.

The policy of the War Department in the matter of such appointments is that the status of the applicant, at the time of examination, as to being in or out of the service, has no bearing upon appointment. Provision can not well be made for retaining all applicants in the service until examined, and incident to demobilization a large percentage of them must necessarily be discharged. Such discharge will in no way prejudice the applicant, and vacancies will be filled at the proper time by the competitive examination of all applicants. Regardless of such preliminary examinations as may be held, no applicant should be appointed who does not pass a thorough and satisfactory final examination.

In putting into effect the order of August 7, 1918, consolidating the Army of the United States during the war into but one Army, it was deemed advisable to discontinue provisional appointments in the Regular Army. There had been 6,094 such appointments made during the war. There existed at that time 899 vacancies in the Regular Army and 908 vacancies have occurred by resignations since the termination of hostilities. At this time there are 630 vacancies in the grade of first lieutenant, Medical Corps, and 982 vacancies in the grade of second lieutenant in the line of the Army. With the

exception of the Medical Corps, whose need for officers has become acute, and whose vacancies exceed the number of applicants for appointment, it has been found undesirable to fill these vacancies. The present law governing appointment of provisional second lieutenants contains restrictions as to age and the various classes of persons who must be considered in order for appointment. These restrictions would operate to cause discrimination against many desirable applicants whose applications are on file; would establish different age limits depending upon the source from which the applicant entered the service, and would fail to give the applicant any credit for his length of service during the war.

An added reason for deferring action in filling vacancies is that the pay of officers is not sufficient to draw into the service the class of men desired. A large proportion of our excellent young officers in the lower grades are leaving the service on account of inadequate pay and it is reasonable to assume that the men who would enter in their places would not be of the same high standard.

In accordance with the policy of placing all candidates for permanent appointment on an equality, the unsatisfactory eligible lists for provisional appointment that were established as a war measure have been abolished. The emergency officers who were on these lists have been placed in exactly the same position as all other emergency officers so far as appointment in the permanent establishment is concerned.

Policies relative to the discharge of emergency officers have been carried out by the Personnel Branch in such manner as to release, as rapidly as possible, officers not desiring to remain permanently in the Army. With the exception of medical officers and a few others of special qualifications, it has been found practicable to release most officers as early as they desired, after their arrival in the United States. In fact, the number desiring to remain in service either temporarily or permanently has been so great that the discharge of many officers earlier than they desired has been found necessary. Since the signing of the armistice, about 128,000 emergency officers have been discharged. It is anticipated that by the end of October the demobilization of both commissioned and enlisted personnel will be practically completed. There are still about 56,000 emergency officers to be discharged and, as the final stage of demobilization is approached the difficulties will increase. It will be impracticable to retain officers in service merely because they desire to be retained. The policy has been firmly fixed that when an officer becomes surplus at his station and there is no vacancy elsewhere for which he is needed, his discharge must, in the interests of economy, be accomplished at once.

When the stage of demobilization was reached that officers had to be discharged against their wishes, as liberal a policy as was permissible was adopted with a view to giving such officers opportunity to secure employment. Upon their certificate that leave of absence was necessary to secure employment, a 15-day leave of absence prior to discharge has been granted and the officer permitted to report for discharge, at the expiration of his leave, to the demobilization center nearest his home.

In addition to separations from the service by discharge, the Personnel Branch has exercised supervision over the retirement and

resignation of officers of the Regular Army. The condition with respect to retirement has been most unsatisfactory. The number of vacancies on the limited list has been so exceedingly small that many officers who have been recommended for retirement on account of physical disability are being held in active service. It is contemplated that advantage will be taken of the first opportunity presented to secure the necessary legislation to relieve this condition and to permit the retirement of all physically disqualified officers.

Resignations.—From November 11, 1918, to June 30, 1919, the resignations of 908 officers of the Regular Army, of whom 828 held provisional appointments, have been accepted. The policy pursued has been to accept resignations when tendered unconditionally, unless there is some exceptional reason for holding the officer in service. It is anticipated that in the year following the armistice, there will have been at least 2,000 resignations.

An analysis of resignations received reveals the fact that the main cause of such resignations is the inadequacy of Army pay as compared with the remuneration that competent men receive in civilian pursuits. Hundreds of officers state that they find their pay insufficient to provide properly for themselves and their dependents. Their financial stress is increased by the condition of necessary separation from their families.

Promotions and assignments.—An important section of the Personnel Branch is the Promotions and Assignments Section. Guided by the fundamental principle that promotions and assignments should be based on efficiency and qualifications of officers, the organization of this section is being developed along the lines that provide for the careful and accurate classification of all officers as to ability, suitability and availability for details. At the same time, data is being compiled as to the officer's efficiency as indicated by the records reaching the War Department concerning him.

Incident to demobilization there have, of course, been a great mass of assignments to be made in the Army, both of regular officers and of emergency officers being temporarily retained in the service. So far as practicable, with the data available, these assignments have been made in accordance with the above stated fundamental principle. During the process of demobilization it was necessary to obtain of various commands telegraphic requisitions for officers needed by them with a view to filling these requisitions from among officers reported surplus elsewhere. With the return of large numbers of officers from overseas, the requisitions have rapidly decreased, and there have been recently very few vacancies to which emergency officers reported surplus could be assigned. In such cases it has, of course, been necessary to direct the discharge from the service of such officers.

Another important phase of the work of this section has been the carrying out of policies with respect to promotion and demotion of Regular Army officers. So far as the latter is concerned, the general policy has been to return to their Regular Army grades officers holding emergency commissions who become surplus, who are detached from any duty pertaining to the emergency, or in whose cases reports of marked inefficiency are received. So far as promotions are concerned, the policy has been to permit only such promotions as give

the officer a rank commensurate with the duties being performed by him.

Special attention has been devoted to the selection of the necessary officers of the line of the Army to fill details in the staff corps and departments and to again place in full operation the schools of the service.

The early operations of this section have been greatly hampered by the lack of necessary data with respect to the efficiency and qualifications of officers. To remove this defect, the Data Subsection has been organized and is now at work upon the problem of securing and recording full data on all officers of the Cavalry, Coast Artillery, Field Artillery, and Infantry of the Regular Army. This data will be classified to meet the purpose for which secured, and will be consolidated and readily available for study and reference in selecting officers for promotions, details, and assignments. This system will be extended so far as applicable to the Officers' Reserve Corps and to retired officers. This is an immense task involving a great amount of detail, as the essential factor in the efficiency of such a system is thoroughness of records and data and the further requirement that they be kept strictly up to date.

A fair start has already been made in this work, and it has become very apparent that neither the old efficiency report nor the officer's qualification card used during the war is satisfactory. A new efficiency report is being developed and will be put in use at an early date. Both for present purposes and for future use, it has become apparent that classification of officers of the Regular Army with respect to their efficiency is necessary. The preliminary work of assembling and examining the records of all such officers is already under way. As soon as sufficient progress has been made it is contemplated that efficiency boards of all arms and branches of the service, composed of senior officers therein, will be convened for the purpose of classifying, in accordance with their records, all officers of the permanent establishment. To secure additional data for use of these boards covering an officer's service during the war, special efficiency reports covering the period of the war are being prepared for distribution.

A proper solution of personnel matters is a matter of vital concern to every present and potential member of our military forces. For a number of years there has been urgent need for a central organization to study the problems of Army personnel, to formulate policies and to direct the appointment, assignment, promotion, and separation from the service of officers. The results accomplished by the Personnel Branch to date indicate that a great step in the filling of this need has been taken. A comparison between the manner in which the expansion of our military forces at the beginning of and during the war was accomplished and the manner in which it could now be accomplished, as a result of the establishment of this branch, is in itself ample justification for the continuance and development of this branch as a permanent feature of the War Department organization. Full advantage must be taken of the lessons we have learned in this war in personnel matters as well as in matters of matériel, tactics, and strategy. Prior to the formation of the Personnel Branch, the General Staff functions relating to personnel were not

performed in our Army and its efficiency suffered because personnel questions which affected the heart of the Army itself had never been analyzed and comprehensively studied and the patent evils corrected. The time has come when we must put round pegs in round holes and keep up to date the scientific study of the officer personnel which has been started.

When the system which is now being developed in the Personnel Branch is in full operation, it will be practicable to control the entering into the service of officers, their assignment, promotion, and separation from the service in such a way as to place and reward individuals more strictly according to merit, to administer personnel matters more impartially to the best interests of the service, and to meet any emergency requiring an expansion of our military forces, in a manner that has not heretofore been possible.

THE MOTOR TRANSPORT BRANCH.

Motor vehicles.—Modern warfare introduced two new methods of transportation—aircraft and motor vehicles. Of these, aircraft, in spite of a few early extravagant predictions, was never available for troop movement. The rôle of motor vehicles, however, underwent a material expansion. The practicability of the rapid transfer by motor trucks of whole regiments of infantry and other troops, and of even larger units, greatly modified both defensive and offensive tactics. This use of motor vehicles by the line troops was a new development of the European war. Their employment by special and auxiliary services demanded great quantities of those vehicles. The types covered are many varieties of special trucks such as passenger cars, those carrying Mobile Ordnance Repair Shops, Mobile Dental Units, the ambulances for sick and wounded, motorized high power radio sets, motorized bath and laundry units, tractors, etc., in addition to the trucks used for hauling feed and ammunition and for transporting troops. To satisfy these demands, there was need for rapid procurement of motor vehicles and for a central control of their distribution to the troops that used them and of their use and maintenance, both at home and abroad.

The automatic distribution of food required a certain number of vehicles irrespective of changes in the tactical situation or the training of troops. In the field, however, it was impracticable for the larger units to maintain at all times the considerable number of such vehicles necessary to make them independent in the matter of transportation. Had a policy of permanent assignment been followed it would have meant that the approximately 200 trucks necessary to move an Infantry regiment might have remained idle for weeks while that regiment remained stationary in one sector. As the supply of these vehicles was at no time equal to the demand for the entire Army, this practice was impossible as well as wasteful. The necessity arose, therefore, first for a central agency to coordinate the procurement and standardization of motor vehicles and, second, for a special service to control the distribution, to operate in the field the motor vehicles used by the Army as a whole and to supply the technical mechanical experts needed to properly repair the machines. After some confusion in production and much delay and trouble in operation both in the camps at home and in the various

zones abroad, these needs were met (1) by the assignment of the duty of supervision of procurement and distribution to the Motor Transportation Branch, General Staff, provided for this purpose, and (2) the creation of the new Motor Transport Corps to perform the work of procurement and standardization, to train special personnel for drivers and repairmen, and to operate the very many different types of motor vehicles in use.

On the entry of the United States into the war, the designing and procuring of motor transportation had been a duty of the Quartermaster Corps which had gained its first motor experience in supplying the punitive expedition in 1916. When the expedition crossed into Mexico, the Army had no trucks and was, therefore, forced to buy whatever types were available. Upon the declaration of war, a standardized cargo truck had just been devised by the Quartermaster Corps. This, however, was but one type and when the Ordnance Department, the Signal Corps, the Engineer Corps, and Medical Department entered the market as independent bureaus to purchase motor vehicles adapted to their own needs, all efforts at standardization were hopeless. Each corps issued its own specifications and determined its own types, with the consequence that the Army supported and used many different types of vehicles with a consequent increased cost of production and maintenance. The productive capacity of the country was limited, and the fact that each corps purchased independently inevitably placed the Army in the position of competing against itself. The first advance toward centralization was the partial consolidation of all motor transportation into a Motor Transport Service, on April 18, 1918, which operated as a division of the office of the Quartermaster General. While this action corrected the former faults to a certain degree a more definite authority and supervision was necessary. This was accomplished in August, 1918, when the Motor Transport Corps was created and given control over the design, procurement, storage, operation, up-keep, and repair, of all motor vehicles and their accessories. It was further given control of the procurement, organization, and technical training of a Motor Transport Corps personnel to operate these vehicles.

On August 26 the Operations Division, General Staff, was given cognizance and control of the design, the standardization of the production, the reception, storage, maintenance, and the replacement of all motor vehicles. As a result, a special procuring and operating service, on a par with the other independent corps and services, such as the Tank Corps, the Chemical Warfare Service, was created; and a special branch created in the Operations Division to supervise the actual work and to coordinate its relations with the troops. In the case of this service these relations were very direct. Perhaps the most important single feature of the procurement of motor vehicles was the selection of standard types of vehicles for use by the whole Army and the consequent reduction of number of types and makes in use. The importance of this lay, of course, in that through this system it was possible to provide standard and interchangeable spare parts for nearly all vehicles, a vital necessity for general up-keep and for repair in the field. A special Standardization Board was appointed for this purpose on October 8, 1918, composed of

representatives of each corps and of the General Staff. At this time there were some 216 different makes of vehicles in use, many of which were represented by several different models. The obtaining of parts for this large number of vehicles to keep them in repair was consequently an enormous undertaking and practically an impossible one under war-time conditions, when manufacturers were bending every effort to procure the required number of completed vehicles. Complete standardization is rather an ideal than a practical end, due to inevitable fluctuations of production and of special needs within the Army. It was possible, however, to limit varieties to 10 or 15 different makes, and to include within this number all sizes of trucks, trailers, ambulances, and chassis for special vehicles, passenger types, motor cycles, and bicycles. This work was scarcely under way when the armistice was signed. As motor transportation is as much a peace as a war-time function of the Army, however, the work of standardized procurement and selection of types continued, with particular reference to provisions for a reserve of motor vehicles and for the methods of production supplementary to this reserve in the event of another war.

All motor vehicles in use by the Army were turned over to the Motor Transport Corps, for maintenance and operation in the case of vehicles for general purposes common to all troops, or for redistribution to those units which were permanently assigned definite quotas of vehicles for their special purposes. The fact resulted immediately in increased efficiency and economy of operation. Whenever possible a pooling system was put into effort, which resulted in a material reduction of the number of vehicles required at any particular time and place. The pooling system affected not only passenger but cargo vehicles, and with the passage of time and consequent increased familiarity with the operation of pools, greater reduction and increased efficiency have been affected. Until the armistice was signed, the burden placed upon the railroads by the shipment of enormous quantities of supplies to the Atlantic seaboard for shipment to France was greatly relieved through deliveries by convoy overland of large numbers of vehicles and huge quantities of spare parts and other motor supplies. The number of vehicles delivered by such convoys to New York and to Motor Transport Reserve Depot for shipment overseas was 32,402. The vehicles in these convoys invariably carried cargo in the shape of spare parts, accessories, and crated vehicles for light-delivery trucks. The total quantity of such cargo carried was 6,358,750 pounds, which reduced rail requirements by approximately 20,000 carloads.

The entire development of motor transportation during the war was an effort to meet a novel and emergency demand. Some experience in motor problems had been gained in the mobilization on the Mexican border and the operations of the punitive expedition before the war, but this experience, relatively speaking, was of the most limited scope as compared to the requirements imposed upon motor transport by the developments of this war. It is essential that the experience gained in this way be conserved and utilized.

Due to the shortage of tonnage, the complete motor equipment for the expeditionary forces was never shipped to France, and the success of this service abroad was vitally dependent on the efficient

methods of organization and operation of such motor equipment as could be sent. This efficiency was never attained with each staff corps and line organization operating its own vehicles; whereas with a central service in control of the entire supply of vehicles it was possible to concentrate and move from place to place, as the military situation demanded, large groups of vehicles, which could not have been collected under the old system, or, if collected, could not have had the cohesion obtainable only through operations by one central organization.

MISCELLANEOUS WORK OF OPERATIONS.

Supervision and direction of mobilization and troop movements was the largest and most important function of the Operations Division before the armistice, while demobilization was the main undertaking after that event. There was, however, in addition, an immense volume of miscellaneous problems referred to this division. In expanding our small Army to nearly twenty times its size, utilizing the resources of the entire Nation, and then in turn demobilizing the Army with equal or greater speed, hundreds of questions occurred almost daily, many of which were referred to Operations for action or for study. These matters not only related directly to the mobilization and demobilization of the Army, but included many other operations matters outside of these two activities.

Some of the problems involved matters of international policy such as questions arising with reference to the enlisting of United States citizens within the United States by recruiting officers of our allies, and with reference to foreign citizens or subjects serving in our Army. There were also various administrative questions to be settled, such as those connected with the application of the draft conventions with our allies providing that citizens of one country, residing in the other, must serve in their own country's forces or be subject to the draft in the country where they resided; the disposition of interned German civilians and war prisoners, and the determination of their proper treatment in accordance with international law; the furlough back to an industry essential to the prosecution of the war of men enlisting or drafted into the military service who were so highly skilled in specialized trades as to be indispensable; the granting of short farm furloughs to soldiers for the purpose of increasing food production; the standards of physical examination for drafted men, including questions involving the extent to which the standards could be lowered in view of the enormous demands of our man power. All such matters were referred to Operations. It may be said, incidentally, that the United States never lowered the physical standard for men to be accepted for combatant military service to include those who were not organically sound. These standards for general combatant service, although extended to include comparatively small men, prescribed sufficient weight, height and chest measurements for the accepted soldier to carry the infantryman's pack. Limited service men had minor physical defects, but none of such a nature that the work to which they were assigned in the Army could injure them. Cooperation with the Navy when the draft act of August, 1918, provided that the Navy should be supplied by the draft was also one of the functions of Operations. Problems con-

nected with guarding the Mexican border also came within the cognizance of this division as did other miscellaneous matters such as replacements for Siberian Expeditionary Forces and overseas garrisons in the Philippines, Hawaii, China, Alaska, and the Panama Canal; cooperation with the United States Employment Service in securing employment for discharged soldiers; questions relating to the Bureau of War Risk Insurance and Federal Board of Vocational Education; cooperation with the Department of Labor in connection with its efforts to naturalize all men who had not received their final papers; questions relating to the reenlistment of noncommissioned officers in their grades; the pay and status of enlisted men in which the War Department policy had to be administratively decided upon; and the question as to the disposition after the armistice of draft deserters. An enormous correspondence with Members of Congress, governors of States, etc., requesting information, was handled in large part by Operations.

III. WAR PLANS DIVISION.

Prewar organization.—Prior to the passage of the national defense act of June 3, 1916, the War Plans Division, then called the War College Division from the fact of being quartered in the Army War College, consisted of 21 officers, each of whom was a member of several of the following committees, viz, military preparation and policy; war plans; organization, equipment, and training; regular troops; militia; military education; military information and monographs; history; library and map room; legislation; and miscellaneous correspondence.

That provision of the national defense act which restricted the number of General Staff officers that might be stationed in or near the District of Columbia to one-half the authorized strength of the General Staff so reduced the War College Division personnel that during the six or eight months prior to the outbreak of war with Germany on April 6, 1917, there were but 11 officers on duty in the division. This number was so small as to prevent any definite organization into committees. A certain specialization in duties was maintained, but a large part of the work was assigned more or less promiscuously.

In spite of this small personnel it is worthy of note that a large amount of work was done in drafting regulations for and in putting into effect such provisions of the national defense act as those increasing the Regular Army and creating the Reserve Officers' Training Corps, Officers' Reserve Corps, Enlisted Reserve Corps, and citizens' training camps. At the same time there was prepared a study of a system of national defense based upon universal liability to military training and service, which formed the basis for the actual organization of the National Army, under the provisions of the act of May 18, 1917, into 16 divisional areas with a cantonment for each area, the exact location of the cantonments being determined by a study of strategic, transportation, and local conditions. Another important result of the studies made during this period was the establishment in May, 1917, of the 16 officers' training camps.

Under the provisions of the act of May 12, 1917, which increased the number of General Staff officers to 91, the number of such officers

on duty with the War College Division was increased to 50. These officers were assigned to the following-named standing committees, viz, recruitment and organization; military operations; equipment; training; legislation and regulations; and military intelligence section.

This organization continued in effect until February 9, 1918. During this period the important work of the division included plans for the reception of the first draft, the organization of the first 38 divisions, the training of the Army, the transport of troops overseas, and production and supply of the necessary arms, equipment, clothing, etc. It was due, in no small measure, to the plans and studies of this division that the initial organization and training of the first increment of the new Army was effected.

Under the provisions of General Orders, No. 14, War Department, 1918, dated February 9, 1918, which provided for a reorganization of the General Staff, the War College Division was organized into:

1. War Plans Branch (then including an Equipment Committee);
2. Training and Instruction Branch;
3. Legislation, Regulations, Rules Branch;
4. Historical Branch;

and was charged with:

- (a) Plans for the organization of all branches of the Army.
- (b) The study and determination of the types and the quantities of equipment and the approval of design and types of equipment submitted by the several bureaus; supervision of research and invention by the several bureaus or other agencies of the Military Establishment in connection with equipment.
- (c) Projects for national defense.
- (d) Training for all branches of the Army, the tactics and methods of warfare to be employed, together with all publications having relation thereto, and the supervision of military schools.
- (e) The translation and compilation of foreign documents relating to military affairs.
- (f) Collection, compilation, and maintenance of complete military records.
- (g) Proposed legislation and the preparation of regulations and rules for the Military Establishment.

Present organization.—Under General Orders, No. 80, War Department, 1918, the designation of the War College Division was changed to the War Plans Division. The principal change from the previous organization of this division was the transfer of the Equipment Committee to the Operations Division of the General Staff.

The War Plans Branch is organized into (a) the Organization Section, which is concerned with organization policy and the preparation of tables of organization for all branches of the Military Establishment; (b) the National Defense Projects Section, charged with the preparation of general war plans and, as successor to the Board of Review, with supervision of seacoast defense projects and plans; and (c) the Inventions Section, which has investigated thousands of inventions, suggestions and devices submitted to the War Department, thus relieving other agencies of this work, expediting consideration of valuable inventions, and rejection of those without value.

The increase in personnel of the War Plans Branch following upon the return of our forces from France and the lessons learned in the

European war have made possible a proper organization and a more systematic and intelligent study of military policy and plans than has heretofore been practicable. If this personnel continues available important progress may well be expected.

The Legislation, Regulations, and Rules Branch has been charged with the drafting of bills for the consideration of Congress designed to carry out recommendations of the War Department. Its work has also covered the preparation of a great variety of amendments, regulations, orders, and circulars. It has studied and made recommendations on many matters of international law and agreements, often in cooperation with the State Department, and has served as a center for consultation and advice on legal problems handled by other branches of the General Staff.

The Historical Branch is charged with the collection, compilation, and maintenance of complete military records. This duty had to some extent been provided for by the War College Library and the Record Section of the War Plans Division, which received, filed, and indexed such records as came through the General Staff. There also could be found the material furnished from the various observers in Europe, publications of various branches of the Government, and books of general military importance. A further agency, however, was necessary to collate, examine, and digest these records; to superintend their collection from all sources in this country and abroad; to take active measures toward collection of material which might otherwise disappear or not be available; and above all, to preserve the results of the study of this material in the form of military and tactical monographs, both for the use of the General Staff and for publication. This agency was provided for in the creation of the Historical Branch in June, 1918.

The organization of the branch provided a section, attached for the war period to General Headquarters in France, for the purpose of collecting and compiling those records, already priceless, of the actual operations of our troops overseas. The branch also provides a repository for official Signal Corps photographs and moving-picture films which are filed, catalogued, and made available to other Government departments and bureaus.

During the period, July 1, 1918, to June 30, 1919, the branches of War Plans Division, above referred to, considered many important subjects, the great majority being related to the military forces used for the prosecution of the war against Germany and her allies.

It is believed to be desirable to include in this report a résumé of the training activities in this country during the war; and the work of the Training Branch of the War Plans, which has had supervision of training matters, will be considered in connection with the general subject of training.

THE TRAINING OF THE ARMY.

Prewar training.—Prior to our entry into the war our only organized forces were those of the Regular Army and the partly trained National Guard. Our military training system had included schools at all camps and posts for the basic instruction of officers and noncommissioned officers, special service schools for the teaching of

the technique and tactics of the different arms and services, general service schools for the teaching of the use of the combined arms of the service and the Army War College.

An attempt had been made to organize an Officers' Reserve Corps and short courses of instruction had been imparted during the summer months in the Plattsburg Training Camps, the students being patriotic men who volunteered to attend.

Advantage had been taken of the opportunity presented by the mobilization of the Regular Army and the National Guard on the Mexican border during the year 1916 for the training of those forces to the greatest possible extent, and the experience gained during that period was of great value.

The divisions of 1917.—During the first year of our participation in the war 42 divisions were organized and all, except a part of the Eighth Division, were sent to France before the signing of the armistice. Of these 42 divisions 8 were Regular Army divisions designated First to Eighth, inclusive; 17 were National Guard divisions, designated Twenty-sixth to Forty-second, inclusive, and 17 were National Army divisions, designated Seventy-sixth to Ninety-second, inclusive.

On May 14, 1917, the units of all the increments of the Regular Army under the provisions of the national defense act approved June 3, 1916, were ordered to be organized to take effect May 15, 1917. These instructions resulted in the organization among others of 27 new regiments of Infantry, 8 new regiments of Cavalry, 12 new regiments of Field Artillery, 4 new regiments of Engineers. The training of these new organizations was at once begun at various camps and posts throughout the United States, the First Division was organized and sailed for Europe and later on the other regular divisions were organized.

By proclamation of the President dated July 3, 1917, the National Guard was drafted into the military service of the United States as of and from August 5, 1917. The National Guard divisions were organized and began their training principally in camps in the southern part of the country.

On July 18, 1917, the announcement of locations of cantonments for troops of the National Army and camps for the National Guard was made. Commanding generals to command the divisions of the National Guard and National Army were announced on August 23, 1917, and directed to proceed to the camps and assume command of the troops.

All of the organized tactical divisions of the National Guard and National Army were exempted under instructions of July 20, 1917, from the control of department commanders in all that pertained to, among other matters, instructions and training; this exemption applying after the troops had arrived at the divisional camps.

In September, 1917, the first of the drafted men reported at their camps and the National Army divisions were organized and training started.

The coordination of training.—When the personnel of the War College Division was organized into standing committees on June 16, 1917, one of these was designated the Training Committee, the functions of which was to coordinate the theoretical and practical

instruction of the United States forces and to handle all questions connected with such instruction.

Late in 1917 a major general of the Regular Army was designated as Director of Training. He was Chief of the Training Committee, reported at Washington for duty in December, 1917, and continued on that duty until March, 1918. At the time of the appointment of the Director of Training, the Training Committee of the War College Division was authorized to be increased to 20 officers, representing different arms of the service and staff corps, and the rôle of the committee was defined as follows:

(a) To study the methods of the war and the methods of instruction which are learned from them by means of the latest information sent from the front by the Staffs of Gen. Pershing and our Allies.

(b) To see that the execution of these methods in the camps and cantonments conforms to the instructions and orders of the Chief of Staff, who is responsible for the instruction of the Army.

(c) To improve continually the methods of instruction by direct and frequent contact with the instructors in the camps in order to secure the best possible results in the battles which were to come.

To accomplish the desired results the committee acting as the direct agency of the Chief of Staff, was charged with the following duties:

(a) Maintenance of close relations with the American Expeditionary Forces abroad and with troops undergoing training in the United States with a view to coordinating training that instruction might be progressive.

(b) Preparation of plans and policies connected with training.

(c) Supervision and coordination of the functions of the central schools (such as the School of Fire, the Infantry School of Arms, and the School for Provisional Second Lieutenants) and the divisional schools for officers, officer candidates, and enlisted men.

(d) Submission of recommendations for the publication and distribution of documents pertaining to training.

(e) The production and distribution of motion pictures as an auxiliary in the training of troops.

(f) The assignment and supervision of, and cooperation with, foreign officers on training duty.

(g) The study of the educational facilities of the United States with a view to the utilization of such facilities in the training of our forces at home and abroad.

The organization of the General Staff on February 9, 1918, provided that the duties of the War Plans Division would include the training for all branches of the Army; tactics and methods of warfare to be employed, together with all publications having relation thereto; and the supervision of all military schools. Those duties were assigned to the Training and Instruction Branch, which was merely a new name for the Training Committee. The supervision of the training of the Field Artillery was placed under the Chief of Field Artillery, an officer being detailed for that position on February 10, 1918.

The reorganization of the General Staff on August 26, 1918, specified that the War Plans Division should include in its functions the cognizance and control of training of the Army, tactics and methods of warfare to be employed, the publications having relation thereto,

supervision of military education and special training, publication of foreign documents relating to military affairs, inspections to insure efficiency and progress in training and instruction throughout the Army. The Chief of Field Artillery and the Chief of Coast Artillery were required to exercise direct supervision over the training of all Field and Coast Artillery units.

During that year of vital importance in training, from the summer of 1917 to the summer of 1918, the consecutiveness of policy had been greatly interfered with, due to changing personnel as, during this period, there had been four different Chiefs of Staff, four chiefs of the War Plans Division, and four Chiefs of the Training and Instruction Branch.

Some training measures.—Trench warfare, as it had developed during this war, had demonstrated the necessity of standardizing and making uniform methods of instruction and of perfecting them by constant exchange of information between the front and the rear. It was necessary that every lesson learned and method found successful in the war should be utilized in our camps of instruction and various schools. The living had to learn the lesson of the dead in order to obtain greater successes with less casualties.

With the view of standardizing and maintaining their training at the utmost efficiency, it was decided that our divisions would be required to follow programs established by the Training Committee approved by the Chief of Staff. These programs were valuable only in the manner of their execution and the improvement in conditions which they entailed.

A multitude of programs and letters of instruction relative to the details of training and the many different phases of instruction had to be prepared and issued, among some of the most important of which may be mentioned:

(a) Programs covering 16 weeks' courses of training for Infantry, Field Artillery, and machine guns, which were issued on August 27, 1917, for the initial training of the divisions.

(b) Regulations and programs for the officers' training camps and schools, depot brigades, and replacement centers.

(c) The revision of the programs referred to in (a). This revision was issued on December 20, 1917, and provided for a course of training 18 weeks in length.

(d) A course of training for divisions which had completed the preliminary and basic course of training. Issued on May 6, 1918.

(e) The confidential letter to division commanders covering the training and instruction of new divisions. Issued on August 27, 1918.

(f) The revision of the course of training noted under (d). Issued October 10, 1918.

In order that training might be coordinated, the Chief of Staff kept informed, liaison between troops and Training Committee maintained, the necessities of troops definitely understood, difficulties of instruction appreciated, methods observed, close relations maintained, information derived concerning the work of foreign advisors, and theoretical schemes be made susceptible of practical application, it was directed that members of the Training Committee should in the capacity of liaison officers visit from time to time the

points where instruction was being imparted, including the camps, cantonments, and central schools. These visits were not for the purpose of criticism but for consultation with commanding officers and observation of the practical workings of prescribed plans. A member of the Training Committee making such a visit acted as the representative of the Chief of Staff and had placed at his disposal by commanding officers any and all facilities desired in the prosecution of his task. Necessary reports or recommendations were made to the Chief of Staff through the Chief of the War College Division.

Briefly, the mission of the liaison officers was:

(a) To take to camps and schools necessary explanations as to plans of instruction and information, resulting from the experience of the Allies or recommendations of Gen. Pershing.

(b) To follow the progress of instruction in programs approved by the Chief of Staff and to assure themselves that the methods were uniform.

(c) To see the results obtained and to report to the Chief of Staff concerning the status of instruction in the Army.

On account of the urgent necessity for officers to assist in the training of the Army, the classes at the Military Academy were graduated before completing the regular four years' course, the dates of graduation being as follows:

Class of 1917, graduated on April 20, 1917.

Class of 1918, graduated on August 30, 1917.

Class of 1919, graduated on June 12, 1918.

Class of 1920, graduated on November 1, 1918.

Class of 1921, graduated on November 1, 1918.

After the signing of the armistice this class of 1921 was returned to the Military Academy on December 3, 1918, to take a special course until June 15, 1919. The course was shortened to one year in 1918 for the purpose of quickly training officers for the emergency, and was lengthened to three years on May 13, 1919.

A large number of officers and noncommissioned officers of the French and British Armies were requested for duty as advisors of training of the United States forces. These officers and noncommissioned officers were specialists in certain branches of training.

To each division and to the central schools there were assigned two groups of five officers and five noncommissioned officers. The French group consisted of specialists in artillery, automatic rifles, hand and rifle grenades, liaison, and pioneer work, while the British group comprised specialists in machine guns, light trench mortars, bayonet fencing, antigas and flame, and sniping.

In addition there were on duty with the Training Committee officers of the General Staff and different arms of the service from both French and British Armies. There was at Fort Sill an officer who was a specialist in the 37-millimeter gun, three additional officers of Artillery from the French Army, and an officer of the French Army who was a specialist in divisional trench mortars.

Specialists in other lines were supplied by the different allied armies to render assistance to the staff corps and special services.

These foreign officers rendered great assistance in training.

The commanding general of the American Expeditionary Forces in France was instructed to forward all programs, schedules, and

plans in regard to training of troops, and all division and department commanders were required to forward copies of schedules and instructions issued by them and used in their divisions.

The Inspector General of the Army was instructed to forward separate reports on methods and results of training and senior officers returning from duty with forces abroad and divisions in the United States, arriving in Washington, were directed to report to the Chief of War College Division for personal conference with the Training Committee, concerning existing conditions.

Training of the soldier for the purpose of combating venereal disease was vigorously and continuously carried on by every possible means, and that training was most successful with results that were extremely gratifying.

In September, 1917, it was decided to utilize motion pictures as an auxiliary in the instruction of troops. A field force was organized and a large number of reels carefully prepared. The exhibition of these motion-picture films, entitled "The Training of the Soldier," was on December 28, 1917, directed to be included in the course of instruction of organizations at those places where such films were received. The pictures were valuable as an aid in the instruction of troops and for the purpose of standardizing instruction.

A multitude of devices intended to assist in training were submitted, most of which it was not practicable to use. Careful consideration, however, was given to all propositions submitted and the decision relative to each one was made entirely on its merits.

A great deal of interest was evidenced during the war in various parts of the country with reference to predraft military training, and many recommendations and schemes were presented for the consideration of the War Department. Owing to the great demands for instructors and equipment it was decided that our energies should be devoted exclusively to the instruction and training of men over whom we had complete control. This limited our activities to men already in the military service.

Numerous offers and plans for the training of youths under military age were submitted, but it was not possible to attempt the instruction of those young men, principally due to the lack of officers.

Officers' training camps.—The quality of troops and their value as an effective force depends to a very large extent upon the character and sufficiency of their training, which in turn is dependent upon the officers who are designated to instruct them in camp and lead them in battle.

Consequently the first step in the upbuilding of the force of nearly 4,000,000 men which the armistice date found bearing arms for the country was the providing of officers to train their men how to fight, and on April 17, 1917, instructions were promulgated for the establishment of the first series of officers' training camps. Fortunately there was a law on the statute books which permitted the War Department to plan at once the methods of developing the first group of the great number of officers who eventually were commissioned in the service of the United States.

When the establishment of the officers' training camps were decided upon, the officers of the Cavalry, Field Artillery, Coast Artillery, and Infantry sections of the Officers' Reserve Corps were or-

dered into active service on April 30, 1917, to take effect May 8, 1917, and were assigned to duty for instruction at those camps.

In planning for an intensive course of training for three months, there was no thought that trained officers could be produced in that short period of time. It was believed, however, that some of the necessary fundamentals could be taught, and that the course would permit the selection of those who showed that they were capable of becoming instructors and leaders of soldiers, and that belief was fully justified by the results.

First series, officers' training camps.—The first camps, 16 in number, were established as follows:

Plattsburg Barracks, N. Y.-----	2	Fort Sheridan, Ill.-----	2
Madison Barracks, N. Y.-----	1	Fort Logan H. Roots, Ark.-----	1
Fort Niagara, N. Y.-----	1	Fort Snelling, Minn.-----	1
Fort Myer, Va.-----	1	Fort Riley, Kans.-----	1
Fort Oglethorpe, Ga.-----	1	Leon Springs, Tex.-----	1
Fort McPherson, Ga.-----	1	Presidio of San Francisco.-----	1
Fort Benjamin Harrison, Ind.-----	2		

There were eligible for admittance to these training camps officers who had already been commissioned in the Officers' Reserve Corps and citizens between the ages of 20 years and 9 months and 44 years. There were admitted 7,957 officers who had previously been commissioned in the Reserve Corps and approximately 30,000 selected civilians.

All who attended these camps were required to undergo the prescribed course of training, subject only to the exceptions made in the cases of those who were designated as assistant instructors in particular subjects, having already demonstrated their fitness for commissions. The reserve officers designated to attend these camps were placed on active duty while attending and received the pay and allowance of their grades and mileage to and from camp. At the end of the training period they were subject to regrading or discharge in accordance with the policy adopted by the War Department to commission officers in the line of the Army only on the basis of ability demonstrated during a period of training and observation at an officers' training camp. Many officers previously commissioned in the Officers' Reserve Corps were found entirely unqualified for commissioned grade and many were reduced in grade.

The civilian candidates received \$100 per month and were furnished subsistence at a rate not exceeding 75 cents per day. They were also allowed mileage from their homes to the camps at the rate of 3½ cents per mile and, if discharged, mileage from their camps to their homes.

The course was concluded August 11, 1917, and of the number admitted 27,341 were commissioned officers of different grades in line and Staff Corps.

Second series officers' training camps.—The results obtained from the first series of camps were so satisfactory that a second series was held beginning August 27, 1917, for the selection of officers capable of filling the grades above second lieutenant as well as vacancies in that grade.

The training camps were located at eight military posts in the United States and one in the Hawaiian Department. The camps in the United States were located as follows:

Plattsburg Barracks, N. Y.; Fort Niagara, N. Y.; Fort Myer, Va.; Fort Oglethorpe, Ga.; Fort Benjamin Harrison, Ind.; Fort Sheridan, Ill.; Leon Springs, Tex.; Presidio of San Francisco.

The classes of men eligible for admission to these camps were: (a) Members of the Officers' Reserve Corps (line sections) who, through no fault of their own, were unable to attend the first series of camps; also reserve officers of Staff Corps under 50 years of age with at least two months' service in war who had experience in Infantry, Cavalry, or Artillery. (b) Noncommissioned officers of the Regular Army recommended in March, 1917, for temporary appointment in case of war and who, through no fault of their own, were unable to attend the training schools for Regular Army noncommissioned officers in April, 1917; maximum age limit, 50 years. (c) Resigned officers of the Regular Army; maximum age limit, 50 years. (d) Men of proper qualifications made eligible for the Officers' Reserve Corps by the Army appropriation act of May 12, 1917; maximum age limit, 50 years. (e) Men who qualified for commissions under General Order No. 42, War Department, 1915; maximum age limit, 50 years. (f) Citizens of the United States having had war service in the present war as officers or noncommissioned officers of the line in the armies of allied powers; maximum age limit, 44 years. (g) Men of exceptional qualifications who tendered their services to the Government prior to June 5, 1917, and who were listed under the War Department Regulations of August 24, 1916; maximum age limit, 50 years. (h) Citizens with valuable military experience and adaptability for commissioned grade, or citizens who had demonstrated marked ability and capacity for leadership, and were clearly adapted for military service in commissioned grade; maximum age limit, 44 years. The minimum age limit for all applicants was 20 years and 9 months; however, in order to obtain the experienced class of men desired, preference was given to men over 31 years of age, other things being equal. Applications were submitted to examining officers appointed by department commanders for each of the divisional areas into which the country was divided for the purpose of apportioning the training camp vacancies. Each of the 16 divisional areas provided candidates for the corresponding training camp, and the examining officers selected and designated the men to attend. It is estimated that over 70,000 civilian applications were received and over 20,000 candidates were admitted to the camps. The duration of the course of instruction was three months, the same as at the first series. The course was concluded November 27, 1917, and a total of 17,237 officers commissioned.

Officers' training camps for colored candidates.—No colored candidates were admitted to either the first or second series of camps. A special officers' training school for colored men was established at Fort Des Moines, Iowa, on June 18, 1917. A contingent was selected in each geographical department from enlisted and civilian applicants and ordered to the schools by department commanders. The course began with a class of 1,250 students and continued four months to October 18, 1917, when 106 captains, 329 first lieutenants, and 204 second lieutenants were commissioned, making a total of 639 officers graduated, all in the Infantry arm.

Officers' training camp for residents of Porto Rico.—To provide a means whereby qualified residents of Porto Rico could secure commis-

sions the first Porto Rican officers' training camp was established at San Juan, P. R., on August 27, 1917. A class of 200 students was admitted, and at the conclusion of the training period on November 27, 1917, there were commissioned 27 captains, 47 lieutenants, and 106 second lieutenants, making a total of 180 officers graduated in the Infantry arm.

The second Porto Rican training school was held from February 1, to May 15, 1918, under practically the same regulations as the second series of camps in the United States, with the exception that the candidates could only be recommended up to and including the grade of captain. The candidates were selected from enlisted men and residents of Porto Rico. Training was given only in the Infantry Arm, and there were found qualified and commissioned 17 captains, 50 first lieutenants, and 186 second lieutenants, making a total of 253 officers graduated.

The Porto Rican Officers' Training School was established under the same regulations as the preceding camps at Camp Las Casas, P. R., June 21, 1918, and 600 students were admitted. The course was concluded November 6, 1918, and there were graduated 23 first lieutenants and 255 second lieutenants, all in the Infantry Arm.

Third series, officers' training camps.—The third series of officers' training camps, or more properly designated, officers' training schools, was established on January 5, 1918. There were 24 schools in the United States, and one each in the Philippine, Hawaiian, and Panama Canal Departments. Twenty-two of the schools in the United States were located in National Army and National Guard divisions, one was located at Fort Oglethorpe, Ga., and one at Leon Springs, Tex. The third series of officers' training camps was intended to produce line officers only, as the chiefs of the various staff corps and departments had before this time been authorized to conduct officers' training schools for obtaining their commissioned personnel.

There were eligible for admission to these training schools enlisted men between the ages of 21 and 40 years in all organized divisions, and enlisted men between the ages of 21 and 40 years from all organizations not in divisions except the Coast Artillery and the various staff corps; also graduates and undergraduates of recognized institutions between the ages of 21 and 31 years. Training was given only in Infantry and Field Artillery at all of these schools except Leon Springs, Tex., where a limited number of men from Regular Army Cavalry organizations were given cavalry training. The War Department had already announced that enlisted men were to be given every possible opportunity for advancement and were to be favored as far as the interests of the service would permit over civilian applicants for commission. In accordance with the above-mentioned policy approximately 90 per cent of the students admitted to these schools were selected from the enlisted personnel of all branches of the Army. The remaining 10 per cent were selected from men in civil life between the ages of 20 years and 9 months and 31 years who had received military training at recognized educational institutions under the direction of an officer of the Army during the preceding 10 years.

Enlisted men desiring to attend the school were obliged to submit their applications to their immediate commanding officers, who for-

warded same to the department or division commanders to be acted upon by boards of officers. These boards, from the names of those reported as being qualified, selected 1.7 per cent of the entire enlisted strength of the command to attend. The civilians submitted their applications to the professors of military science and tactics at the educational institutions who selected and designated the men to attend, quotas being assigned each of the educational institutions.

All civilians admitted to the school were required to enlist for the duration of the war and, if not successful, to complete the term of enlistment. While in training they received the pay and allowance of private first class, or about \$33 per month. Enlisted men designated to attend the school received the pay of their grades or, if privates, the pay of private, first class.

All men, both from civil life and from the Army, entered these schools with the understanding that they were not to be commissioned at the close of the training period, but were to be listed as eligible for appointment as second lieutenants, to be later commissioned as vacancies occurred, meanwhile retaining the status of enlisted men. While awaiting such appointment they were to be known as officer candidates. All successful graduates eligible for appointment, who were of the grade of sergeant or above, retained their grades as additional noncommissioned officers, and all below grade of sergeant were appointed additional sergeants.

To provide for a thorough course of instruction in Army paper work and company administration the training period was extended to three and one-half months and ended on April 19, 1918, the graduates being listed as eligible for appointment as second lieutenants in the following numbers:

Infantry	8, 165
Field Artillery	3, 347
Cavalry	147
Total	11, 659

It soon became necessary to utilize the services of these men as officers, and on May 29, 1918, orders were issued directing the commissioning of all officer candidates, graduates of the third officers' training schools, as second lieutenants in the arm of the service in which found qualified. They were accordingly commissioned and assigned to duty.

Fourth series, officers' training schools.—The fourth series of officers' training schools was inaugurated on May 15, 1918, in 24 National Army and National Guard divisions in the United States. Schools were also established in the Philippine, Hawaiian, and Panama Canal Departments, but the schools at Panama and in the Philippines were afterwards discontinued. To these schools enlisted men and certain members of the Reserve Officers' Training Corps units and educational institutions were admitted. It was originally planned that these schools should be a part of the divisions and would move with the divisions, but it was afterwards found necessary to transfer the men from their divisions and establish central officers' training schools. A small number completed their course of training in their divisions, the total number thus graduating being 2,418.

Central officers' training schools.—In June, 1918, central officers' schools were established at the permanent replacement camps. There were three of these schools for Infantry located at Camp Pike, Ark.,

Camp Gordon, Ga., and Camp Lee, Va., one school for machine gunners at Camp Hancock, Ga., and one for Field Artillery at Camp Taylor, Ky. Candidates from the divisions which were scheduled for early overseas' service were transferred to these central officers' training schools. The first class graduated at the central schools on August 26, 1918, 3,384 being commissioned as second lieutenants from the three Infantry schools. During August and September 3,690 were graduated from the Field Artillery central officers' training school. The machine-gun central officers' training school at Camp Hancock, Ga., graduated 649 officers on September 15, 1918.

On September 15, 1918, two additional Infantry central officers' training schools were established, one at Camp MacArthur, Tex., and another at Camp Grant, Ill. The capacity of each five of the Infantry schools was increased to 5,600 with an intake of 1,400 per month for each school. The length of the course was four months, and it was expected there would be graduated each month a total of 4,500 Infantry officers.

Due to the shortage of Infantry officers, instructions were issued on September 27, 1918, to graduate on October 15, 1918, the class which it had been intended to graduate on November 15. The shortage as reported under date of August 12, 1918, was as follows: Shortage, 1,326 captains of Infantry; shortage, 3,825 first lieutenants of Infantry; surplus, 520 second lieutenants of Infantry.

A Cavalry central officers' training school and schools for enlisted specialists and noncommissioned officers of Cavalry were established on September 17, 1918, at Camp Stanley, Leon Springs, Tex.

On November 9, 1918, the name of the Cavalry central officers' training school was changed to "Central Cavalry Training School," as it contained sections for enlisted men as well as for officer candidates. After the signing of the armistice a large majority of the officer candidates elected to take their discharge and the school was closed on December 5, 1918.

On October 1, 1918, the situation as to officers' training schools was as follows:

Infantry, 5 central officers' training camps.

Location.	Capacity.	Intake (monthly).	Length of course (months).
Camp Pike, Ark.....	5,600	1,400	4
Camp Lee, Va.....	5,600	1,400	4
Camp Grant, Ill.....	5,600	1,400	4
Camp MacArthur, Tex.....	5,600	1,400	4
Camp Gordon, Ga.....	5,600	1,400	4

Sixty per cent of the candidates were secured from the enlisted men of the Army, 20 per cent from civil life, and the remaining 20 per cent from the Students' Army Training Corps. The average number of graduates from each of these schools was about 1,000 per month.

Cavalry—Location of school, Leon Springs, Tex.

Number attending—Authorized number about 1,000 (450 of these were Texas National Guardsman and their course was for three months, the remainder were to have course of four months).

Total capacity—About 2,500 students.

This school was established for the purpose of training Texas National Guard officers and officers for five new Cavalry regiments.

Field Artillery—Location of school, Camp Taylor, Ky.

Length of course—12 weeks.

Intake per week—(a) Had been about 500 per week. (b) Expected to be about 1,200 per week.

Capacity—About 6,000; by December 15, to be about 13,000.

It was expected that 13,650 would graduate between October 1, 1918, and March 5, 1919.

Engineers—Location of school, Camp Humphreys, Va.

Capacity (projected)—3,000; actual, 1,800.

Number of graduates per month (projected)—750; actual, 600.

Length of course (projected)—Four months; actual, three to five weeks.

Machine Gun—Location of school, Camp Hancock, Ga.

Capacity—4,000 students.

Intake—1,250 per month.

Output—1,000 per month.

Length of course—Four months.

Coast Artillery—Location of school, Fortress Monroe, Va.

Capacity—825, being increased to 2,400.

Number attending—About 1,200.

Graduated—To October 1, 1918, 3,388; monthly output to be about 500.

Length of course—Three months.

On October 17, 1918, the establishment of the Infantry Central Officers' Training School at Camp Fremont, Calif., was directed, to which approximately 20,000 candidates were to be admitted. This school was never opened owing to the fact that the armistice was signed before the first class was organized.

In the meantime the entrance classes to the Infantry schools had been increased to 1,800 per month in each school, or total admittance for the five schools of 9,000 candidates per month, with an estimated monthly output of 5,850 officers.

On October 21, 1918, it was planned to admit to the central officers' training schools limited service men whose physical defects were of a minor nature, the number being limited to 5 per cent of each class. Only a few limited service men were so admitted due to the fact of the armistice being signed shortly afterwards.

After the first two officers' training camps, in which the Coast Artillery contingent was included, a separate Coast Artillery training school was established at Fort Monroe, Va., and conducted directly under the supervision of the Chief of Coast Artillery.

9,370 Infantry officers were graduated from the five Infantry officers' training schools, 2,456 were graduated from machine-gun central officers' training school, and 8,737 were graduated from the Field Artillery central officers' training school.

From the four series of officers' training camps and schools and from the central officers' training schools a total of 80,568 officers were graduated and commissioned.

On the date of the signing of the armistice, November 11, 1918, instructions were issued that no more candidates be admitted to

officers' training schools. A large majority of the candidates elected to take their discharges, but many remained for a few weeks and completed the course and were commissioned in the Officers' Reserve Corps.

Schools—The need of instructors.—In the early summer of 1917 the War Department was confronted with the enormous task of accomplishing in the shortest possible time the efficient training of an army of over a million men, divided as follows:

(a) The Regular Army, then in process of reorganization, in which more than two-thirds of the enlisted personnel of the Infantry and Field Artillery were recruits.

(b) The National Guard, to be organized into 17 divisions with an approximate strength of 420,000, of which only 30 per cent of the enlisted men were trained to a certain degree, the remainder being recruits. Forty per cent of the officer personnel was untrained.

(c) The National Army, to be organized into 17 divisions, the enlisted personnel of which was absolutely raw recruits, while the officer personnel was to be furnished largely from the officers' training camps then in operation and from among the noncommissioned officers of the Regular Army, each of the higher units to have a few officers from the Regular Army.

The problem of training this large force devolved, almost in its entirety, upon the trained officers of the Regular Army, and while there was a full realization of the urgent need for the presence of all officers with their organizations, it was apparent that provision had to be made with the least practicable delay for a corps of highly-trained specialist instructors who could be distributed throughout the many training areas to assist division commanders in the organization of divisional schools, and later, as their number increased, could be returned to their organizations and used as instructors in brigades and regiments.

Central schools.—There resulted a system of central schools, schools of doctrine, which became the foundation of the plan of training, for the provision of the necessary trained specialists and the insuring of uniformity in doctrine and methods of instruction the importance of which was incontrovertible. These central schools included the following:

(a) The Infantry Schools of Arms, at Fort Sill, Okla. (developed from the School of Musketry at that place), where instruction was imparted in the use of the rifle and pistol, hand and rifle grenades, the bayonet, automatic arms (such as the automatic rifle and light machine gun), heavy machine guns, and 1-pounder guns; in the duties of sappers, bombers, and pioneers; in the construction and utilization of field fortifications for line troops; and in the methods and matériel of gas defense.

(b) The School of Fire for Field Artillery, at Fort Sill, Okla., which had to be reestablished and greatly enlarged, the activities of that school having been suspended in 1916, due to the Mexican situation.

(c) The Mounted Service School, at Fort Riley, Kans., which was continued with modifications.

(d) Coast Artillery schools for noncommissioned staff officers and enlisted specialists.

- (e) Aviation schools.
- (f) Balloon schools.
- (g) Ordnance School of Application at Sandy Hook, N. J.
- (h) The Army Medical School at Washington, D. C.
- (i) Schools for bakers and cooks.
- (j) School for provisional second lieutenants at Fort Leavenworth, Kans.

Many other schools were established later.

The schools at Fort Leavenworth, Kans., were suspended in 1916 due to the need of officers with troops on the Mexican border, where the National Guard and a great part of the Regular Army were on duty. The school plant at Leavenworth was utilized for the training of a class of approximately 250 provisional second lieutenants of Infantry, Cavalry, and Field Artillery of the Regular Army, who were examined for commissions in January, 1917. After that class had completed the course in July, 1917, the school for the training of provisional second lieutenants of the Regular Army was continued at Fort Leavenworth, all untrained provisional second lieutenants assigned to the Infantry, Cavalry, and Field Artillery being required to take the course before joining their regiments. Those who had served at least one year in the Regular Army as enlisted men and those who were graduates of the officers' training camps were not sent to the school.

The character and scope of instruction for provisional second lieutenants assigned to the Corps of Engineers and the Coast Artillery Corps was prescribed by the chiefs of those corps, who also recommended the places to which the lieutenants were to be ordered to take the course of instruction.

The policy which did not permit officers who were commissioned in the National Army to serve with other forces than the National Army and which did not permit them to be used as instructors in central schools was very detrimental and was afterwards changed. By the 1st of September, 1917, all but one instructor had been ordered away from the Infantry School of Arms, all but one from the School of Fire, and several instructors had been ordered away from the school for provisional lieutenants at Leavenworth, all of which seriously interfered with the work of the schools at a very vital period.

Divisional schools.—The plan of training also included the establishment of the following schools in each division:

First. (a) Course for the tactical instruction of brigade commanders, staff officers, and regimental field officers under the direct personal supervision of the division commander, the course to be taken up during the first 16 weeks of intensive training and continued until the arrival of the division in France.

(b) Courses of like nature to be conducted for regimental officers in each regiment by the colonel under the supervision of the brigade commander.

Second. A system of divisional schools as listed below:

- (a) Infantry school of arms.
- (b) Artillery school.
- (c) School for stable sergeants and farriers.
- (d) School for mess sergeants, bakers, and cooks.

- (e) School for horseshoers.
- (f) School for company mechanics.
- (g) School of equitation.
- (h) School for supply officers and supply sergeants.
- (i) School for clerks.
- (j) School for saddler and cobblers.
- (k) Signal school.
- (l) School for bandsmen and buglers.
- (m) School of hygiene and sanitation, and such other schools as the division commander deemed necessary.

The policy with reference to the divisional schools contemplated that:

(a) Division commanders would direct the schools and select competent instructors.

(b) Divisional schools for officers would continue after divisions arrived in France and throughout the war, especially for frequent short "refreshing" courses covering various branches and phases of training.

(c) Schools would be kept in touch with the latest combat methods by the relief of instructors at least every three months and returning them to duty with troops.

(d) Continuity of best instruction methods would be maintained in the schools by avoiding relief of all instructors at one time.

(e) Divisions in France would be called upon to furnish a few instructors for each division training in the United States, wounded officers to be utilized if practicable.

Other schools and courses of instruction.—The officers' training camps and schools which were established for the purpose of selecting men competent to be officers are discussed under another heading. In addition to the central schools, the divisional schools, and those schools referred to elsewhere, there were numerous schools and centers of instruction established from time to time during the war by the different arms and services, and provision was made for special courses of instruction and training. Among those were the following:

The Coast Artillery School at Fort Monroe, Va., for special training of officers and enlisted men of the Coast Artillery service, with the Brigade School of Artillery Fire at Camp Abraham Eustis.

School for Bandmasters, Fort Jay, N. Y.

United States Army Music Training School, Governors Island, N. Y.

Training School for Chaplains, Camp Taylor, Ky.

Schools for horseshoers, teamsters, and packers, at each remount depot. The commanding general of each National Army cantonment and National Guard camp was directed to detail a certain number of men to take the course of instruction, which course of instruction was under the supervision of the Quartermaster General.

A brigade and field officers' school at Fort Sam Houston, Tex., with a short course for colonels and lieutenant colonels of Infantry and Field Artillery.

Vocational training schools at various educational institutions for training selected enlisted men in certain trades. These vocational schools maintained by the special services, while primarily for military purposes, had their curricula so arranged that the course of

training received was such as to be of the maximum benefit in peace-time pursuits.

Shortly after the declaration of war training schools were established at Army posts and camps for the instruction of such noncommissioned officers of the Regular Army as were deemed capable of becoming officers and a large number of these men were commissioned.

About 500 reserve officers were sent to Harvard University on August 26, 1917, for a three weeks course of instruction in trench warfare. They reported to the United States Army officer who was on duty there as professor of military science and tactics and had the advantage of the assistance of a group of French officers who were on duty at the university and who had planned and supervised the construction of a trench system of considerable extent.

To provide for the special training of lieutenants and unit commanders who would be needed to replace losses later on, there were sent to France after the close of the first series of officers' training camps 2,200 newly commissioned officers, of which number 1,000 were lieutenants of Infantry, 600 lieutenants of Field Artillery, 200 lieutenants of Coast Artillery, 200 lieutenants of Engineers, and 200 lieutenants of Signal Corps.

Courses of instruction were held at the Army War College from time to time. In the summer of 1917 there was a short course for officers who had been detailed to the General Staff Corps, the work in that course being done after the day's duties were completed by the officers. In the fall of that year there was a course for staff officers of National Guard divisions, and in 1918 there were courses for staff officers of new divisions.

After the divisions had been organized in the fall of 1917, most of the division commanders with their chiefs of staff were sent in different groups at different times to France for a period of about one month for a term of observation at the French and British fronts, under the direction of the Commander in Chief of the American Expeditionary Forces. From the viewpoint of efficient training this action was of special importance, and while these officers were taken away from their divisions at a most important time the resultant increase in the efficiency of training more than offset the disadvantage of the absence of these officers.

A course of instruction for higher commanders and staff officers of divisions was planned and was conducted by selected French and British officers under the supervision of division commanders.

Early in the war much thought, study, and work were devoted to the question of physical reconstruction and training of wounded soldiers. Plans were perfected for the training of such soldiers in the trades, professions, or other kinds of work that they might be able to do in their crippled condition.

On December 5, 1918, commanding officers of all posts, camps, and stations, including service schools and the United States Military Academy, were directed to establish schools for officers in shoe and sock fitting, utilizing as instructors, if available, officers who had completed the course at the Army schools for shoe and sock fitting, which had been held at Camp Meigs, Washington, D. C., Jefferson Barracks, St. Louis, Mo., and Camp Fremont, Calif. It was directed that such schools continue in operation until all company officers had

completed the course of instruction, which covered 12 hours, 7 of which were theoretical and 5 practical.

On January 21, 1919, schools were established for reserve and temporary officers who had elected to remain in the regular service. The schools for the Field Artillery, Coast Artillery, and Engineer officers were established at the location of the officers' training schools of those arms, namely, Camp Zachary Taylor, Ky., Fort Monroe, Va., and Camp A. A. Humphreys, Va. The school for Infantry officers was established at Camp Lee, Va., and that for Cavalry officers at Fort Sam Houston, Tex.

The object of these schools was to provide some means whereby the general worth and efficiency of these officers might be properly ascertained and whereby their training in the fundamentals of the military profession might be properly supervised and continued during the period of demobilization and reorganization.

The rapid discharge of temporary officers resulted in a decision to abandon these schools, and on March 28, 1919, all post, camp, and station commanders were directed to establish officers' schools which all permanent, provisional and temporary officers of the line of the Army (including officers of Engineers serving with troops), who had been commissioned during the years 1916-1919, inclusive, were required to attend. Such schools commenced operations on April 1, the school period covering two and one-half hours daily, with the exception of Saturdays, Sundays, and holidays. These schools were for basic instruction and were conducted under direct supervision of the post, camp, or station commander, who was held responsible for the proper conduct of the school and the efficiency of instruction.

The divisions of 1918.—Plans were perfected in the summer of 1918 for the organization and training of additional divisions. The training of the first six of the new divisions was commenced about August 1, and was to have been completed by November 30. The length of time to be devoted by all divisions was four months. The training required for all divisions in the first part of the course was to cover the training of units up to and including the regiment, this training to be in open warfare with a minimum of instruction in trench warfare and later on a definite period for combined training. The necessity for uniform training throughout all new divisions was appreciated, and every effort was made to obtain the end desired. It was found to be essential for uniform training that when once begun the program should be followed without modifications other than those imposed by weather, condition of equipment, or health of troops. The influenza epidemic seriously interfered with all training from September to November, 1918. The following was the general plan of training for these new divisions:

(a) All officers to be trained in the specialties, namely, in musketry, the technical handling of automatic rifles, hand grenades, and bayonet work before being sent to their divisions.

(b) No officer after being sent to a division to be detached to attend special service schools, but to be instructed within the division in schools as provided under existing regulations. The number of such schools were reduced by the fact that divisional schools in specialties for officers were not required.

(c) Units having once been organized, officers were not to be taken from their organizations except for a limited time each day

as indicated above, thus preventing separating the officer from the administrative and disciplinary control of his unit. The full complement of officers not only with an organization but also with a division to be provided and maintained.

(d) Officers, together with troops, of the special arms, where possible, to be trained at camps provided for that purpose.

(e) All schools for the training of specialists, such as the Infantry School of Arms, Artillery School of Fire, Engineer Camp of Instruction to be continued.

(f) Each officers' training center, except Camp Gordon, to be enlarged so as to have a capacity for continuous instruction of at least 6,000 men.

(g) Direct liaison between the Training and Instruction Branch and the divisions about to be organized to commence as soon as headquarters or staff personnel is at the new camps, and to continue at set intervals to insure progress and uniformity throughout the divisions.

(h) A course in staff duties for divisional chiefs of staff and their assistants in the new divisions to be given at least a month before such divisions are organized. This course to be given at the Army War College along the lines prescribed for the Army Staff College in France, but to be much more elementary in its nature, with a view to preparing these staff officers for entrance into the Army Staff College in France.

(i) A technical course outside of the ordinary administrative and routine matters connected with staff duties to be instituted in each division about one month after the division has started to organize, and to be continued for at least a month, lectures or conferences being held two or three times a week.

(j) The usual platoon and company commanders' school and regimental school for company officers to be continued. The special schools for instruction and training of such enlisted men as bakers, cooks, horseshoers, and packers to be continued.

(k) In each replacement camp a special class to be organized consisting of about 2,500 men to be designated as noncommissioned officer candidates. These men to have at least six weeks' training at the replacement camps and to form a reservoir with which to meet the replacement needs for overseas requirements and for new officers. Instruction to be provided for these noncommissioned officers to include the ordinary routine duties of instruction for recruits as well as instruction with special classes designed to develop their responsibilities and acquaint them theoretically with their duties as noncommissioned officers. Part of the instruction was to develop them as drillmasters in connection with the training of men of the organizations to which they are assigned. Their further training to be accomplished through noncommissioned officers' schools within the regiment.

(l) The training and organization of troops for the service behind the line and other auxiliary corps troops, as each group of six divisions completes its organization and begins to function as a corps, to be provided for in advance. This would prevent drafts being made on combatant organizations to meet the needs of auxiliary

troops for service behind the lines. Transfers for vocational reasons to be reduced to a minimum.

(m) Training officers who have been returned to this country from France to be used as instructors in our divisional schools for specialists and in special schools such as the Infantry School of Arms, and if the number becoming available permits, to be available for assignment to divisions.

(n) Each division commander to be informed as to the time available for training and as to the priority of the several subjects required for training.

(o) The Infantry regiments of divisions to be organized at the designated camps, but the special arms at camps now provided for this purpose; this to secure economy in instructors and special equipment, and uniformity in results. Exception to be made, however, in the case of the Signal Corps organizations belonging to the division, for part of their training must be given in the same camp with the Infantry. A nucleus of partly trained men for each Infantry regiment to be obtained from the replacement camps for Infantry.

The training of replacements.—Prior to 1918, replacements had come partly from depot brigades, partly from the untrained draft, and partly from partially trained new divisions. The taking of men away from divisions was a practice indulged in by all arms of the service. This undesirable practice, in addition to crippling the esprit of new units being organized and hampering the training of divisions, did not tend to inculcate the best spirit in the organizations to which the replacements were sent.

With the increase in our military program, the necessity became evident for the establishment of replacement centers where unassigned troops should be held and trained until called for as replacements, when these trained troops could then be fed directly to organizations needing them.

About April 1, 1918, the first replacement camp for Infantry was established at Camp Gordon, Ga. The success of this camp caused the establishment of three others for the same purpose, one at Camp Lee, Va., one at Camp Pike, Ark., and one at Camp MacArthur, Tex. About the same time as the Infantry replacement camps were being organized, replacement camps for other branches of the service were established.

On August 21, 1918, the following camps were designated as training centers, the primary activity of which was the training of replacements: Camp Lee, Va. (Infantry); Camp Gordon, Ga. (Infantry); Camp Pike, Ark. (Infantry); Camp MacArthur, Tex. (Infantry); Camp Jackson, S. C. (Field Artillery); Camp Zachary Taylor, Ky. (Field Artillery); Camp A. A. Humphreys, Va. (Engineers); Camp Abraham Eustis, Va. (Coast Artillery); Camp Hancock, Ga. (machine gun).

The instruction in the technical and staff branches was charged to the chiefs of those branches, to be conducted by them according to their needs, but supervised by the Training and Instruction Branch. The training for the Infantry and Machine Gun replacements centered in the Training Branch. A training circular was developed, based on actual experience in such training, and the whole scheme of replacement training was subjected to the same supervision and inspection as all other training.

Replacement training up to the time of the armistice was conducted on the following basis: Infantry, 60 per cent; Engineers, 13 per cent; Field Artillery, 8 per cent; Quartermaster Corps, 4 per cent; Medical Department, 3 per cent; Coast Artillery Corps, 3 per cent; Ordnance, 2 per cent; Cavalry, 1 per cent; Signal Corps, 6 per cent. Replacement training for the other services, such as Air Service, Chemical Warfare, Tank Corps, etc., had not been considered up to this time. The latter two services were in course of development, while the Air Service was more or less automatic in replacement. The need for more service squadrons was being supplied by transferring personnel from supply squadrons and other organizations that were not needed for the purpose for which they were organized in the first instance. This supplied the enlisted personnel, while the officer personnel was being turned out from the flying and balloon schools.

Rifle training.—If our troops are to be efficiently trained in the use of the rifle, it is necessary that they receive instruction in both marksmanship and musketry, marksmanship being the skill with the rifle which enables the individual to use his weapon with effect, to hit, while musketry is teamwork with the rifle, which enables a leader best to utilize the marksmanship of his men to defeat the enemy. The individual soldier must first be trained in marksmanship, and then grouped in a unit wherein the individuals and the leader are trained in musketry.

Marksmanship.—Instruction in marksmanship has for a long time been a prominent feature of the training of our Army, competitions and additional pay for qualification increasing the interest in this form of instruction with the result that marksmanship in the Regular Army before our entry into the war was excellent.

Upon the declaration of war the training in marksmanship of our enlarged Army presented three problems for solution:

1. The training of sufficient instructors.
2. The providing of equipment and facilities.
3. The providing of the necessary time for training.

The attempt was made to meet the first of these problems by including in the course at the officers' training camps the subject of marksmanship so that the junior officers would be competent to instruct their men in this important subject. At these camps, however, only about 38 hours could be devoted to this subject, the course being, in an abbreviated form, that which the recruit in the Regular Army received prior to the war. As a consequence, the newly commissioned officers joined their commands with an insufficient knowledge to permit them to be competent instructors in marksmanship.

The second problem, that of providing sufficient equipment and facilities, was met in part by installing in each National Guard camp and National Army cantonment a target range of 250 targets for the training of a division. Each of the ranges was larger than any range in the United States prior to the war. As there was not sufficient of the regular type of target carriers on hand to equip these ranges, the Ordnance Department developed and manufactured a new type of target carrier from material easily procurable, which has proved very satisfactory. The supply of gallery rifles being inadequate, practically no troops had gallery practice. The production in rifles was such that these were not received in sufficient num-

ber to start training before December, 1917. Had rifles been available instruction in marksmanship could have been started at least one month earlier for those divisions first formed.

When we entered the war with Germany the opinion prevailed that it was necessary to train our troops to a considerable extent in trench warfare, and the amount of ammunition which could be devoted to training was limited. Accordingly a new firing course was adopted, which included firing from trenches at short ranges and firing at mid ranges by selected men, but the course was modified in March, 1918, to include more firing in the open and to require all men to fire at mid ranges. Both these courses required less expenditure of ammunition than the regular qualification course in use prior to the war.

The third problem, that of providing the necessary time for training, is intimately connected with equipment and facilities. The available ranges had a capacity that made it possible to give a division the minimum prescribed training in marksmanship in two months.

Theoretically a division which was recruited from the first draft, and which was adequately equipped with rifles by December 15, 1917, should have completed the minimum prescribed marksmanship instruction by February 15, 1918. However, weather conditions were unprecedentedly bad, numbers of men had to be taken from many divisions and sent to France before they had had this instruction, and most divisions found themselves a month before starting for France below their required strength, and had to be filled up with newly drafted men at the last moment. It was physically impossible to give some of these men marksmanship instruction.

For the purpose of training instructors in marksmanship there was established in the spring of 1918 at Camp Perry, Ohio, a Small-Arms Firing School, designed to train 1,200 officers a month. At this school, a system of training marksmanship instructors was developed.

Musketry.—For a number of years preceding our entry into the war, training in musketry received considerable attention but was limited by the availability of areas suitable for the conducting of field firing problems.

The necessity for greater efficiency in the use of the rifle, especially in field firing exercises in large masses, resulted in the creation of the School of Musketry at Monterey, Calif., in 1907, which school was transferred to Fort Sill, Okla., in February, 1913, and in the summer of 1917 was enlarged and became the Infantry School of Arms.

The 10 years prior to 1917 saw the gradual development of a system of musketry which was the system in which students at the officers' training camps were instructed. In addition to theoretical study these students averaged six hours of practical application in firing problems when facilities were available. The total theoretical instruction was perhaps sufficient, but time and lack of facilities did not permit enough practical instruction.

Sufficient practical instruction of troops in the United States in musketry during the war was not possible. The time of training of some divisions was too short to permit the requisite amount of such instruction and in many localities it was difficult to obtain ground where the firing problems could be held with safety.

On September 12, 1918, there were transferred to Camp Benning, Ga., the Infantry School of Arms from Fort Sill, the Small-Arms Firing School from Camp Perry, Ohio, and the Machine Gun School from Camp Hancock, Augusta, Ga., and on October 9, 1918, it was definitely decided to establish at Camp Benning an Infantry school. In February, 1919, the scope of the school was enlarged so as to cover the entire field of Infantry technique and tactics to include the thorough training of the battalion in cooperation with other arms. The Infantry School of Arms was merged into this greater Infantry school and in general forms the technical portion of the larger school.

For the correct training in the use of the rifle the terrain must not only permit the training of thousands of riflemen in accurate target practice but also permit field firing exercises of large bodies of troops, attacking precisely as in action, against silhouettes so located as to represent the enemy and indicate the accuracy of the fire delivered. The site at Camp Benning satisfies this requirement, there being a tract with proper back stop on which 1,200 targets may be placed for the training of 1,200 individuals at one time. There are ranges nearby for the machine guns, hand and rifle grenades, automatic rifles, Stokes mortars and 1-pounders, while the Artillery and tanks may carry on their tactical training with Infantry by staging firing problems without in any way interfering with the operations of the other arms.

Accuracy in the use of the various Infantry weapons having been attained the ground permits the simultaneous staging of field firing exercises in great number.

The war with Germany has in no way decreased the importance of the rifle and rifle training. The rifle is still the premier weapon of the soldier. All men armed with the rifle and all replacements should be trained to effective use of the rifle.

Proper training in rifle firing requires skilled instructors. A system for producing skilled instructors, and the best methods of training the individual must be developed. This system and these methods must be uniform throughout the Army for all organizations and replacements alike. The most efficient method of assuring this is to train at a central school a large number of instructors who, upon joining their organizations, can be utilized to insure proper and uniform methods of training.

One important lesson of the war with Germany was the need of trained officers to act as instructors, and an appreciation of the time and facilities necessary for their training. For the training of large numbers of Infantry officers in technique (which includes marksmanship) and in tactics (which includes musketry) a plant such as was, on the signing of the armistice, under development at Camp Benning must be provided.

Machine-gun training.—Machine-gun instruction in the United States at the outbreak of the war in 1914 was centered at the School of Musketry, Fort Sill, Okla. This school was equipped for the handling of small classes, and after our entry into the war was expanded into the Infantry School of Arms.

The importance of machine guns at that time was not generally appreciated in the United States. As the war progressed, and before the United States entered the war, the importance of machine

guns became more apparent, the number of students at Fort Sill was increased and auxiliary training schools were established in the concentration camps on the Mexican border, the largest school being at Harlingen, Tex.

Due to the development in the service of a broader understanding of machine gunnery, the machine gun department of the school at Fort Sill concentrated its work on modern water-cooled machine guns and on war born methods of fire direction and control. When the United States entered the war this school was equipped for its task of instructing the training staffs of the several divisions. The number of machine guns in our Army was increased by the addition of one battalion of four companies for each brigade and one motorized battalion of two companies for each division. Our pre-war strength had been one company of 12 guns for each regiment.

From each of the divisions, officers of machine gun units were selected and sent to the school at Fort Sill. They were trained intensively for three months and then returned to their divisions to act as instructors of other machine-gun officers in the division schools.

The process was thorough but too slow. It became evident that machine-gun officers and men must be assembled at a training center and receive their instruction at first hand from the few capable instructors available in our Army. The other Infantry weapons were at this time demanding increased areas at Fort Sill and the Field Artillery School at Fort Sill was also expanding to such an extent that it was evident that the additional space needed for machine-gun training could not be provided at that place.

After examination of a large number of sites for a machine-gun school, one was chosen at Camp Hancock near Augusta, Ga., for a machine-gun training center. The machine-gun department of the school at Fort Sill was transferred to Camp Hancock in June, 1918.

The machine-gun training center at Camp Hancock was organized and functioned as follows:

(a) Central Machine Gun Officers' Training School for the training of candidates for commission as first or second lieutenants in machine-gun units.

(b) Machine Gun School for the further training of graduates of the Central Machine Gun Officers' Training School and for officers detailed for machine-gun work above the grade of lieutenant.

(c) Main training depot for the training of oversea replacements and the training of nuclei of machine gunners for new divisions.

After the signing of the armistice, the training center was closed and, as a measure of economy, transferred to the Infantry School at Camp Benning, Columbus, Ga.

Field Artillery Training.—The prewar training of Field Artillery consisted of the yearly courses of instruction of the regular units at their various stations under instructions promulgated by the War Department; instruction of National Guard units under the national defense act; courses at the School of Fire for Field Artillery at Fort Sill, Okla., for Regular officers; and shorter courses at the same school for National Guard officers. Other training activities consisted of courses for regular noncommissioned officers at the School

of Fire; and courses at other points for horseshoers, mechanics, saddlers and farriers. One Field Artillery Reserve Officers' Training Corps unit was well established at Yale University prior to the outbreak of war. This whole training system, founded on a small permanent establishment and a partially organized National Guard, was entirely inadequate for training the large force of Field Artillery called for by the demands of the war.

In April, 1917, the Field Artillery of the United States consisted of 9 regiments of Regular Field Artillery, approximately 16 regiments of National Guard, and a reserve of 221 officers and 33 enlisted men. The trained Regular Field Artillery on April 6, 1917, that is, officers and enlisted men with more than one year's service, was 275 officers and 5,253 enlisted men.

The strength of the Field Artillery on November 11, 1918, was 22,393 officers and 439,760 enlisted men.

This enormous expansion was aided by the conversion of 8 regiments of Regular Cavalry and 15 regiments of National Army Cavalry into Field Artillery regiments and trench mortar batteries and in addition by the temporary transfer of a number of Cavalry and Coast Artillery officers to the Field Artillery.

The School of Fire for Field Artillery at Fort Sill, Okla., was reopened in July, 1917, with a class of about 60 officers. This school had been discontinued after the spring of 1916, on account of the need of all personnel on the Mexican border. The formation of the National Army divisions in August, 1917, took away much of the instructor and student personnel; nevertheless, largely expanded in every respect, the school got into efficient running order by the fall of 1917, and into full swing by the spring of 1918. A proportion of the officers of all brigades attended the course before leaving the United States, depending upon the date of their departure for France. Until the spring of 1918, training of officers consisted of the short courses at various training camps, training with their units in the divisions, and a course at the School of Fire for some. This school trained some 6,000 officers, who upon graduation were assigned to various Field Artillery activities.

In the spring of 1918, brigades were not being efficiently trained in divisional cantonments. This condition arose from lack of matériel, lack of sufficient and efficient instructors, and lack of training area. To meet this condition four brigade firing centers were organized, being located at Camp Doniphan, Okla., Camp Jackson, S. C., Camp McClellan, Ala., and Camp Knox, Ky.

Matériel and instructors were concentrated at these camps. Staff schools and schools for all specialists were concentrated. Officers returning from abroad were detailed as instructors and the services of officers from the foreign missions were utilized.

Those brigades which passed through the firing centers were trained and organized, upon their departure from this country for France, to the extent which should have been expected in the limited time available. Fourteen brigades were trained at these centers.

In the 17 National Army Field Artillery brigades organized in August, 1917, the brigade commanders and senior field officers (one, or two, and rarely three per regiment), were detailed from the Regular Army. Officers from the Reserve Corps and officers' training camps made up the remainder of the commissioned personnel.

The enlisted personnel of these brigades was composed almost entirely of men brought into the service by the draft act. These units developed in the face of the most discouraging handicaps, such as lack of material with which to train, and the more serious handicap of being called upon to build up the National Guard units by the transfer of partially trained men which resulted in a disorganization of the training of the National Army units, and continued a serious drawback to this training and to the development of the units until the establishment of Field Artillery replacement depots, from which replacements were drawn for organizations at home and abroad.

Approximately 20 per cent of the trained Field Artillery officers left for France with the first expeditionary force; this further rendered the task of training the great amount of Field Artillery needed more difficult.

Due to the conditions described above, at the beginning of the year 1918, the training of the Field Artillery was not satisfactory.

On February 10, 1918, the office of the Chief of Field Artillery was created. The beneficial results on training were immediate and from the outset more than justified the creation of the office in question.

The following projects contributed toward the efficiency of the training of Field Artillery:

(a) The organization and enlargement of the School of Fire for Field Artillery at Fort Sill, Okla.

(b) The organization of the Central Officers' Training School for Field Artillery at Camp Zachary Taylor, Ky.

(c) The establishment of schools to train officers in the following specialist subjects: Staff work; aerial observation; radio work; motors and tractors; telephone; liaison; orientation.

(d) The establishment of schools for the instruction of specialists, and the development of motor mechanics and chauffeurs.

(e) The redistribution of matériel along equitable and efficient lines.

(f) The establishment of a system of training and coordination through inspector-instructors, who both inspected and helped in the training of brigades.

(g) The organization of brigade firing centers for the completion of Field Artillery training up to the stage of readiness for taking up combined training of the different arms.

(h) Establishment of the Field Artillery Replacement Depot at Camp Jackson, S. C., and later the establishment of a similar depot at Camp Zachary Taylor, Ky.

Cavalry training.—Experience gained during the Civil War and the many years of campaign on our western frontier and also along the Mexican border resulted in the development of the training of our Cavalry along lines somewhat different from those followed by European cavalry. The lance was discarded long ago by us and that typical American weapon, the pistol, is carried by all cavalrymen. Stress was laid by our Cavalry on training for dismounted action, and since the adoption of the Springfield magazine rifle of 1903 the men have been armed with the same rifle as that of our Infantry. The saber has continued to be one of the cavalryman's

weapons, but the arme blanche never has been a favorite American weapon.

Advantage was taken of the opportunity presented in 1916 when large forces of our Cavalry were in Mexico to develop an improved method of training in mounted pistol firing, and much time was also devoted to training in field firing exercises with the rifle.

The Mounted Service School at Fort Riley, Kans., trained large numbers of officers in modern methods of horsemanship, and these officers carried the doctrine of that school to their regiments and became the instructors of their brother officers.

For a number of years most of our Cavalry has been on duty in the field in the varied country along the Mexican border from the Pacific Ocean to the Gulf of Mexico; their everyday work has been a constant training in the field conditions of mounted troops, and this continued during the war.

In April, 1917, the Cavalry consisted of 17 regiments, of which 3 regiments and 1 squadron were on duty outside of the continental limits of the United States. Some Cavalry accompanied the first of our expeditionary forces to Europe in May, 1917, and later on four regiments of Cavalry were sent to France.

Eight new regiments of Regular Cavalry were organized in May, 1917, and in July of that year, when it was thought that great forces of Cavalry could not be utilized in France under the conditions of trench warfare then existing, these eight new Cavalry regiments were transformed for the period of the war into eight regiments of Field Artillery, were trained as artillery, assigned to divisions, and accompanied their divisions to France.

After the return of the expeditionary forces from Mexico early in 1917, a provisional Cavalry division for drill and maneuvering purposes was organized at El Paso, Tex.

Late in 1917, it being considered that increased numbers of Cavalry would be necessary in the operations on the western front, the Fifteenth Cavalry Division was organized in the United States, and included nine of the Regular Cavalry regiments; about the same time, in order to provide the necessary corps Cavalry and forces for border duty, 15 new regiments of National Army Cavalry were organized, and began their training under Regular officers who were assigned to command them.

Later the Cavalry division was disbanded and in August, 1918, when the new divisions were organized the 15 regiments of National Army Cavalry were transformed into 30 regiments of Field Artillery and 15 trench mortar batteries, the 30 regiments including 17 regiments 3-inch guns horsed, 9 regiments 6-inch howitzers, 1 regiment 4.7-inch howitzers, 1 regiment 6-inch guns, and 2 regiments 3-inch guns motorized.

A training camp for Cavalry officer candidates was inaugurated at Fort Bliss, Tex., and later on a Cavalry Training School for officer candidates, noncommissioned officers, and specialists, was established at Leon Springs, Tex. Numbers of cavalry officers attended the Infantry School of Arms and the School of Fire for Field Artillery as students and both schools included Cavalry officers in their corps of instructors.

When the 15 regiments of National Army Cavalry were transformed into Field Artillery, six National Guard regiments in the

State of Texas were partially organized and could have been called into service. The officers from these regiments were sent to the Central Cavalry School at Leon Springs, Tex. It was planned at this time to organize five more regiments of National Army Cavalry, the officers for which regiments were to be assembled at the Cavalry School at Leon Springs for training, the intention being to have organized and trained by April 1, 1919, a Regular Cavalry division of nine regiments for foreign service, and a sufficient force to care for the needs of the Mexican border.

Training of special services and corps.—The details of the training of the various special services and corps will not be considered in this report, as these matters will undoubtedly be covered in the report of the respective chiefs of services, under whom this training was conducted subject to the general control of the General Staff.

COMMITTEE ON EDUCATION AND SPECIAL TRAINING.

On February 10, 1918, there was created within the War Department, "The Committee on Education and Special Training," the functions of that committee being to study the needs of the various branches of the service for skilled men and technicians; to determine how such needs were to be met, whether by selective draft, special training in educational institutions, or otherwise; to secure the cooperation of the educational institutions of the country, and to represent the War Department in its relations with such institutions; and to administer such plan of special training in colleges and schools as might be adopted. This committee consisted of officers of the Army and associated with it was an advisory civilian board, members or representatives of educational institutions. The chief of each staff corps and department was directed to detail an officer to consult with the committee concerning the needs of his corps or department.

National Army training detachments.—The Committee on Education and Special Training was primarily organized for the purpose of providing for the training of technicians and mechanics to meet the Army needs. This was accomplished by the organization of National Army training detachments at technical schools and colleges throughout the country. Men were obtained for these detachments by voluntary induction and were sent direct from the draft boards to the educational institutions. By November 11, 1918, about 140,000 men were given technical training in 141 educational institutions. This training was started during April, 1918, and at the time of the armistice 102,000 men had completed their training and had been assigned to organizations for technical service. Thirty-eight thousand were still in training.

Students' Army Training Corps.—During the summer of 1918 a serious shortage of officer material developed as supplied by the usual agencies. The draft law increasing the age limits endangered still further the supply of officer material. As material for junior officers had been supplied very largely from college graduates and undergraduates, it was felt that this source of supply must be preserved. Therefore, orders of August 24, 1918, provided for the raising and maintaining by voluntary induction and drafting a Students' Army Training Corps, units of this corps to be authorized at educational institutions which met the prescribed requirements.

On October 1, 1918, regularly enrolled students in the higher educational institutions were voluntarily inducted into the service at the institutions and formed into Students' Army Training Corps units. The Students' Army Training Corps thus organized was divided into two sections, the Vocational Section which absorbed the National Army training detachments and the Collegiate Section composed of regularly enrolled college students. These units were maintained at the institutions at Government expense and 527 contracts were entered into with as many institutions. The Students' Army Training Corps was demobilized as soon as possible after the armistice of November 11, 1918. One hundred and fifty-eight thousand students were enrolled in the Students' Army Training Corps. At the time of the armistice 11,000 men had already been appointed to officers' training camps, and 4,000 more had just been designated to proceed to such camps.

The Students' Army Training Corps units were composed of enlisted men in the service of the United States, and as such had equal privileges for attendance at officers' training schools with the enlisted men in Army cantonments. If members of the Students' Army Training Corps attained the proper standard for entrance into an officers' training school, they were to be recommended therefor; otherwise, they were to be assigned to organizations for duty as non-commissioned officers or privates.

Experience developed great difficulty in securing the proper number of qualified candidates for the officers' training schools, and with the greatly enlarged military program this difficulty threatened to become acute. The military program called for the organization of 98 divisions by July 1, 1919, 80 of which were to be abroad in October, 1918. It was estimated that 150,000 additional officers would be needed before July 1, 1919. On the basis of previous experience, about 65 per cent of those entering the officers' training schools won commissions. This, therefore, meant that officer candidate material had to be provided to a number of not less than 200,000. High standards had to be maintained and careful selection made of all available material to provide this number. The Students' Army Training Corps provided a method by which men having a certain preliminary educational training might be brought together in relatively small groups, where they would be under direct observation. It provided a careful method of testing and selecting officer candidates for the line of the Army. It also made possible the selection of technical experts, such as medical officers, engineers, quartermaster officers, ordnance officers, and large numbers of technically qualified enlisted men who had proved to be indispensably necessary in modern warfare. The Collegiate Section was open to men from all walks of life who met a prescribed educational standard; that is, the equivalent to graduation from high school. The Vocational Section was open to men in all walks of life who had a grammar-school education or equivalent trade or business experience.

It was proposed to keep the units of the Students' Army Training Corps at all times at their normal strength. Therefore, as members of the corps were transferred for duty at officers' training schools, noncommissioned officers' schools, or to other organizations, their

places were to be taken by enlisted men selected from the Army cantonments, or by men inducted into the service from civil life.

The Students' Army Training Corps did not provide either exemption or deferment for any favored class. The bulk of the men inducted into the Students' Army Training Corps were to be assigned to duty in the field at the same time with other men of their age who were not in the Students' Army Training Corps. Furthermore, many men were to be assigned to such duty at an earlier date than would have been the case had they not joined the Students' Army Training Corps, since they anticipated their draft and rendered themselves immediately liable to such transfers and assignments as the needs of the service might require.

The provision that members of the Students' Army Training Corps should be on active duty status, and therefore housed, messed, and instructed at the expense of the Government, entirely removed discrimination against the poor man. It opened the best educational institutions of the country, many of which had hitherto been mainly accessible only to the sons of well-to-do parents, to all young men who had the necessary educational qualifications.

On June 3, 1918, three Reserve Officers' Training Corps camps were inaugurated at Plattsburg Barracks, N. Y., Fort Sheridan, Ill., and the Presidio of San Francisco, Calif. Six thousand five hundred students attended these camps, but none were commissioned upon their termination. These camps were continued from July 16 to September 18, 1918, for the Students' Army Training Corps and on September 15, 1918, 3,264 lieutenants of Infantry were commissioned; 597 officers of Artillery were also commissioned, but they are included in the total graduates from the Field Artillery central officers' training schools, where they had been sent for further training.

Reserve Officers' Training Corps.—Upon the demobilization of the Students' Army Training Corps, which relieved the Committee on Education and Special Training of most of its functions, the re-establishment and development of the Reserve Officers' Training Corps was taken up as the chief function of the committee.

A "Reserve Officers' Training Corps Branch" was created in the War Plans Division on August 29, 1919, the duties of that branch being to supervise, direct, and control affairs relating to the Reserve Officers' Training Corps, and the Committee on Education and Special Training ceased to exist.

SYSTEM OF MILITARY EDUCATION.

The system of military education for the Army has been given careful study with the view of making such modifications as might be dictated by the experience gained during the war. Under the present approved plans it is contemplated that the system of military education in the Regular Army will embrace:

For officers: (a) Basic schools; (b) unit officers' schools; (c) special service schools; (d) general service schools.

For cadets: (a) The United States Military Academy.

For enlisted men: (a) Post schools; (b) unit noncommissioned officers' schools; (c) special service schools.

The basic schools for officers have for their object to qualify by systematic and standardized methods of training all officers, upon

initial entry into the service, in order that they may function intelligently on being assigned to duty with their arm or service. Basic schools, for each arm or service, in general, will be located at one of the corresponding special service schools. Specifically, these schools replace the regular course of the old garrison schools. The school term of all basic schools will be the same.

The primary object of the unit officers' schools is the instruction and training of officers of all grades with a view to the proper training of troops of their commands. The secondary object is to continue the progressive development of the technical and tactical education of all officers. The primary object demands that these schools be conducted concurrently with the training of the troops and that the courses of instruction be definitely and closely coordinated with the schedules for troop training, in order to carry out efficiently the training schedule in progress and to coordinate training in different units of the same command. The secondary object demands that instruction in theory and practice in the tactics of the combined arms and services be given, in order to prepare officers for the course at the School of the Line and to continue their training after each period of absence from normal duty. Such theoretical work as may be required in accomplishing the above objects, will be developed through the applicatory methods of instruction.

The object of the special service schools is to develop and standardize the training of officers in the technique and tactics of their respective arms or service. It is contemplated that an officers' special service school will be established for each of the arms and services as follows: (*a*) The Infantry; (*b*) the Cavalry; (*c*) the Field Artillery; (*d*) the Coast Artillery Corps; (*e*) the Engineer Corps; (*f*) the Signal Corps; (*g*) the Air Service; (*h*) the Tank Corps; (*i*) the Ordnance Department; (*j*) the Medical Corps; (*k*) the Motor Transport Corps; (*l*) such other special service schools as may be hereafter authorized.

While the primary object of the above schools is the training and development of officers in the technique and tactics of their own arm or service, in order to avoid duplication of effort and to insure dissemination of correct doctrine and methods, each of these will have the function of training officers in specialties which are also common to other arms or services. These schools shall be open, therefore, to officers of all arms, services, and grades according to the necessities of the service.

The object of the general service schools is to train officers in the tactics of the combined arms, for the General Staff and for high command. They comprise the following: (*a*) The School of the Line; (*b*) the General Staff School; (*c*) the General Staff College.

The object of the School of the Line is to train officers of all arms in the combined use of all arms and services functioning with a division, including the functioning of corps and army troops and services in their relation to the division, and in the duties and responsibilities of field officers with regard to education and training in the Army.

The object of the General Staff School is to train selected officers for duty as General Staff officers with tactical units and for higher command. In addition, it will conduct special courses for general

officers and officers of the technical and administrative services. Graduates of the General Staff School specifically recommended by the commandant for instruction at the General Staff College will be placed on the eligible list for this detail.

The object of the General Staff College is to train selected officers for duty in the General Staff Corps and for high command. In addition it will conduct special courses for general officers and selected officers of the technical and administrative services.

The object of the post schools is to teach enlisted men in the common branches of education and to give them vocational training. These schools are established at every garrisoned post or station.

The primary object of the unit noncommissioned officers' schools is to prepare noncommissioned officers on duty with troops to carry out efficiently the training schedule in progress and to coordinate the training in the different units of the same command. The secondary object is to continue the progressive development of the technical and tactical education of all noncommissioned officers. These schools are conducted at every garrisoned post or station and the attendance of all noncommissioned officers on duty with combat and technical units thereat is mandatory.

The object of the special service schools for noncommissioned officers is to train certain noncommissioned officers and enlisted specialists in the technique and duties of their arm or service in accordance with their respective needs.

IV. MILITARY INTELLIGENCE DIVISION.

NEGLECT OF MILITARY INTELLIGENCE.

Prior to our declaration of war with Germany this essential general staff agency which is charged with gathering, collating, and disseminating the military information necessary as a basis for correct military decisions existed only in a rudimentary form. In April, 1917, it consisted of a section of the War College Division, comprising a total personnel consisting of two officers and two clerks and supplied with only \$11,000 by congressional appropriation for the performance of a duty vital to the interests of the Army and the Nation. Every other army of importance was provided with a far-reaching military intelligence service directed by a well-equipped general staff agency recognized as on a par with the agencies charged with military plans, operations, and supplies. As a result of our neglect of this service, the valuable information gathered by the officers whom we had attached to European armies during the first two years and a half of the war was never properly used. We were also without accurate data as to the powerful and insidious espionage, propaganda, and sabotage methods with which Germany at once attempted to thwart our military effort.

ORGANIZATION OF MILITARY INTELLIGENCE DIVISION.

On July 1, 1918, the Military Intelligence Section, War College Division, General Staff, had been reorganized as the Military Intelligence Branch, Executive Division, General Staff, and consisted of 173 officers, 23 noncommissioned officers, and 589 clerks in Washing-

ton, as well as representatives in the more important cities of the United States, in all important foreign countries, and an extensive field force made up of specially chosen and instructed personnel in each military unit at home and overseas. This service had already rendered Gen. Pershing great assistance by supplying him with the required intelligence funds, with competent, loyal interpreters, agents, code and cipher experts, and other special intelligence personnel, and with the material peculiarly adapted for intelligence needs.

The staff reorganization, effected by General Orders, No. 80, War Department, August 26, 1918, made the Military Intelligence Service a coordinate division of the General Staff and placed it on a par with similar services of general staffs of other nations of the world. The additional authority and prestige thus provided made it possible for this division to deal with other governmental agencies and with the intelligence services of our allies much more expeditiously and effectively than was possible under the previous imperfect organization. At the time of the armistice the Military Intelligence Division in Washington was made up of a highly specialized personnel consisting of 282 officers, 29 noncommissioned officers, and 948 civilian employees, the field force had been greatly improved and enlarged, the assistance furnished the intelligence section of Gen. Pershing's staff was becoming daily more direct and more valuable, as was the cooperation with the State Department, the Treasury Department, the Department of Justice, the Post Office Department, Naval Intelligence, the War Trade Board, the War Industries Board, and the National Research Council.

Since the signing of the armistice the Military Intelligence Division, in spite of the necessary rapid demobilization of its civilian and temporary commissioned personnel, has contributed much valuable information to the American commission to negotiate peace, for which over 20 officer-specialists were furnished, and with which was effectively linked the military attaché system and the intelligence service of the American Expeditionary Forces. Investigation of alleged cases of enemy activity and disloyalty within the civil population in the United States which had been necessary during the period of actual hostilities terminated on November 30, 1918, but the enormous financial interests of the United States involved in the cancellation of war contracts and the salvage of surplus stores has made necessary the continuance of a small bureau in this division for the investigation of alleged graft and fraud in connection with such matters. The gathering and effective use of military information is, however, held to be the primary function of the Military Intelligence Division in time of peace; and it is upon this principle that the business of this division is now being conducted.

The duties assigned to the Military Intelligence Division by General Orders, No. 80, War Department, 1918, are:

This division shall have the cognizance and control of military intelligence, both positive and negative, and shall be in charge of an officer designated as the Director of Military Intelligence, who will be an assistant to the Chief of Staff. He is also the chief military censor. The duties of this division are to maintain estimates revised daily of the military situation, the economic situation, and of such other matters as the Chief of Staff may direct, and to collect, collate, and disseminate military intelligence. It will cooperate with the intelligence section of the general staffs of allied countries in connection with military intelligence; prepare instructions in military intelligence work for the

use of our forces; supervise the training of personnel for intelligence work; organize, direct, and coordinate the intelligence service; supervise the duties of military attachés; communicate direct with department intelligence officers and intelligence officers at posts, camps, and stations, and with commands in the field in matters relating to military intelligence; obtain, reproduce, and issue maps; translate foreign documents; disburse and account for intelligence funds; cooperate with the censorship board and with intelligence agencies of other departments of the Government.

In order to perform the duties thus assigned it the Military Intelligence Division has been organized into an Administrative Section and 12 other sections, grouped according to the nature of their functions into three branches. Positive, Geographic, and Negative. The magnitude, importance, and variety of the work of this division can best be shown by a summary of the activities of its various subdivisions.

Administrative Section (M. I. 1).—Due to the confidential character of the greater portion of intelligence work and the need of speed in the transaction of daily business, a considerable amount of decentralization in the matter of direct communication, money accounts, and the custody of intelligence records has been authorized. This has placed a great burden on this section, which administers the affairs not only of the office in Washington but of branch offices in nearly every part of the world.

Nearly 500,000 cases have been investigated since the declaration of war. In a large proportion of these cases the Department of Justice, Naval Intelligence, State Department, and War Trade Board were interested. The system necessary to preserve the confidential character of the records of such cases and at the same time to provide for a proper interdepartmental exchange of information and the rapid handling essential to effective investigation or prosecution has been perfected from time to time and is now in a satisfactory condition; but it is believed that steps should be taken in the interest of economy and efficiency to provide for a central registry system for all governmental agencies charged with investigations of this character which should be put into operation as soon as war is again declared.

In addition to the usual duties of such an agency, the personnel subsection was charged with the important duty of recruiting the Corps of Interpreters and the Corps of Intelligence Police. A high standard of loyalty and discretion was maintained in both these organizations; and in the Corps of Interpreters a comprehensive knowledge of both spoken and written French and German was required before an applicant was recommended for appointment. Commissioned intelligence personnel for general intelligence purposes was selected after the most searching investigation and with particular regard for the special knowledge or ability required, but no officers were assigned to combat intelligence duty with troops who had not received previous military training. The efficiency of the intelligence service as a whole was largely due to the high standard of ability, integrity, and discretion set by this section.

MILITARY INTELLIGENCE DIVISION PUBLICATIONS.

The administrative section was also charged with editing and publishing the various intelligence publications authorized from time to time. It was well equipped for photographic and litho-

graphic reproduction and, during the war, maintained a separate printing plant. Over 30,000 photostatic and 15,000 photographic reproductions of intelligence documents were made during the fiscal year. The following publications were issued:

The Daily Intelligence Summary.—This was a confidential bulletin containing a résumé of the military situation throughout the world as well as the political and economic conditions bearing on the war. The summary was based on information received during the preceding 24 hours. It was distributed throughout the military service and to the State Department and other cooperating agencies. Due to a reduction in clerical personnel publication was discontinued on June 30, 1919.

The Weekly Intelligence Summary.—This summary has a more restricted distribution than the Daily Summary by reason of the fact that the estimate of the international situation is based upon information often received through diplomatic channels or furnished confidentially by allied intelligence services. Information is furnished bearing on world politics in which the United States has an interest, the increase or modification of military establishments and the territories occupied by the enemy. The Summary is composed of three parts as follows:

(a) Military; strategic surveys covering all fronts and military phases of importance in various belligerent countries.

(b) Political; salient political factors bearing on the general strategic situation, and surveys of political, ethnic, and psychologic factors pertaining to the internal situation of various countries. Mexico, as a unit, was included under this heading.

(c) Economic and social; surveys of the economic situation in the various countries relating to the general strategic situation.

Since the signing of the armistice, the Summary has become rather an interpretation of the more significant news of the week rather than a mere record of news items.

The Work and Activities of the Military Intelligence Division.—This was a weekly report recording in chronological order all the activities of the division for the confidential information of all intelligence officers and coordinate branches of the War Department. It has been discontinued, but served a useful purpose during the period of hostilities.

THE POSITIVE BRANCH.

This branch is charged with the collection, evaluation, collation, and dissemination of all information except that recorded in maps, military monographs, and handbooks, with the compilation and study of codes and ciphers and with all the translation for the War Department. It is composed of the following sections:

Information Section (M. I. 2).—*The strategic estimate.*—The primary function of this section is to weigh and digest information, to interpret it and to prepare the result in such a form that it will be readily available at the time and place needed. Information, no matter how good, which is not made ready to use is without military value. The principal product of this section is a confidential work known as the Current Estimate of the Strategic Situation. This estimate is prepared in loose-leaf form in bound volumes distributed

throughout the General Staff, the State Department, and our forces abroad. It is arranged geographically, and is based on the principle that, for each country in the world, the General Staff should be prepared to answer two questions: "What is the situation to-day?" and "What is it going to be to-morrow?" Since no military situation is known in a comprehensive manner unless the political, economic, and psychologic situations bearing upon it are also known, the situation in each country is discussed under four heads: Military, political, economic, and psychological. These estimates form a current monograph of the world and have been of great use to the State Department. The interior organization of this section now corresponds geographically to that of the divisions of the State Department, and the cooperation between the two services is improving daily.

Collection Section (M. I. 5).—Military attachés.—This section is charged with the selection and instruction of military attachés, their assistants and clerical force, and with the detailed administration of the military attaché system. Until the organization of this section in February, 1918, we had greatly neglected the opportunity for the systematic gathering of information furnished by a well-chosen and well-administered corps of military attachés. Our choice of attachés had been haphazard, and the supervision and support given them had often been spasmodic. We are now, however, already able to select better officers, to train them before sending them to their posts, to utilize, advise, and support them while on this important duty, and to see that their acquaintance with the countries to which they have been accredited is made use of after their relief and return to this country. It is hoped that a continuation and perfection of the present system will put this country on a par with other countries in this respect, and that there will be evolved a considerable corps of officers having detailed knowledge of the language, military establishments, political conditions and customs of foreign nations. The proper type of officer should be encouraged to prepare himself for duty of this kind by travel and the study of foreign languages. Military attachés are now maintained at 33 foreign capitals.

During the war, in addition to the gathering of positive information, our military attachés cooperated successfully with our naval attachés in the exceedingly important duty involved in contraspy duty abroad, and those in countries contiguous to Germany were able to furnish the American Expeditionary Forces with valuable and timely combat information procurable in no other way. For this purpose direct communication between attachés and our forces was provided.

By a special system of filing and indexing, the information obtained by this section is at once furnished to the Information Section (M. I. 2), and the many and varied technical reports on military organization, equipment, and methods submitted by military attachés are promptly sent to all interested War Department agencies and to all other appropriate Government departments. The cooperation of the National Research Council has been of much value in perfecting this system.

Translation Section (M. I. 6).—All War Department translation has been consolidated in this section which, during the fiscal year, has translated 60 technical documents from 7 foreign languages, all

the "suspect lists" furnished by the French and Italian intelligence services, 1,438 letters in 31 different languages, as well as 3,562 citations of American officers and men. In addition, 38 foreign daily papers in 10 different languages from 13 different countries are read and the important parts extracted for the other sections of the division and for the Historical Branch of the War Plans Division. The personnel of this section is competent to translate 19 foreign languages; and, by utilizing the services of temporary personnel, 17 additional languages can be translated. Thirty-nine Government offices habitually make use of the services of this section.

In addition to the actual preparation of translations this section has been charged with the preparation of valuable glossaries of the new terms and abbreviations evolved during the war.

Code and Cipher Section (M. I. 8).—Codes and ciphers.—The work of this section concerned an important field of endeavor which, before the war with Germany, was almost entirely unknown to the War Department or to the Government of the United States as a whole. Early in 1917 it was realized not only that secret means of communication were essential to the successful prosecution of the war, but also that, in order to combat the means employed by a skillful and crafty enemy, a War Department agency was required in order to make an exhaustive study of this complicated subject and to put to practical use the results of such study. As finally developed this section comprised five bureaus, as follows:

The Shorthand Bureau.—Organized in response to demands which came chiefly through cooperation with the postal censorship because of the fact that it was almost impossible for examiners to discriminate between unusual shorthand systems and cipher, this bureau was in a few months able to transcribe documents written in some 300 shorthand systems in 7 different languages.

Secret Ink Bureau.—By direct liaison with the French and British intelligence services, this bureau built up a useful fund of knowledge covering this hitherto little-known science which is at once so useful and so dangerous. Over 50 important secret-ink spy letters were discovered which led to many arrests and prevented much enemy activity. Prior to the lifting of the postal censorship an average of over 2,000 letters per week were tested for secret inks.

Code Instruction Bureau.—This bureau provided the necessary practical instruction in codes and ciphers given to prospective military attachés, their assistants and clerks, and to officers and clerical personnel designated for duty in similar work in the American Expeditionary Forces in France and Siberia.

Code Compilation Bureau.—The 1915 War Department code soon fell into the hands of the enemy, and this bureau was required to compile Military Intelligence Code No. 5 which succeeded it, as well as two geographical codes specially adapted to the sending of combat information from France. A casualty code, designed to save errors and time in connection with the reporting of battle casualties was commenced in September, 1918. It was not published on account of the signing of the armistice, but the work on it is complete and available for future use.

Communication Bureau.—This bureau was the nerve center of a vast communication system covering the habitable globe. By special

wire connections and a 24-hour service maintained by skillful and devoted operators exceptionally fast and confidential communication was established with all important news centers at home and abroad. Messages from Paris have been received and decoded within 20 minutes after sending; and the average time necessary to communicate with Vladivostok and Archangel was less than 24 hours. From September, 1918, to May, 1919, this bureau sent and received 25,000 messages containing 1,300,000 words.

Combat Intelligence Instruction Section (M. I. 9).—Until June, 1918, it had not been possible to coordinate the instruction of field intelligence officers on duty with combat divisions in the United States with similar instruction given in France. In cooperation with the Training Branch of the War Plans Division, there was at that time initiated a comprehensive training project based on the principle that divisional intelligence officers in the United States should be appointed only from officers who had qualified in the work in France. The training program involved was issued to troops as Training Circular No. 21, published by the War Plans Division. At the date of the signing of the armistice this program had been completed in nine divisions. An inspection of the intelligence groups of four divisions indicated that the program was based on sound principles and that the groups were as nearly ready for combat duty as was possible without actual combat experience. It is essential that training in combat intelligence be continued in time of peace; and special courses in this work have been included in the projects for the service schools of the future. This section of the Military Intelligence Division ceased its active functions upon the demobilization of the combat divisions in the United States and the designation M.I.9 was applied to the Monograph Section of the Geographic Branch.

THE GEOGRAPHIC BRANCH.

This branch of the Military Intelligence Division, which is charged with the direction of the War Department policy with respect to maps of foreign countries, with military monographs and handbooks and with the custody of the General Staff map collection was formerly included in the Positive Branch, but its activities have recently become so specialized that on April 24, 1919, it was deemed expedient to group the Map Section and the Military Monograph Sections into a separate organization.

Map Section (M. I. 7).—*Maps.*—This section is charged with the custody of the foreign map collection of the War Department, with the procurement and issue of all foreign maps, and with the compilation of map information procured by M. I. D. The map collection now filed and indexed consists of over 300,000 sheets, and is being augmented daily, numerous additions having recently been received from the American Expeditionary Forces. With the maps still to be received as a result of America's participation in the late war, it is believed that within the coming year the collection will aggregate almost 1,000,000 sheets. Normal accessions during the fiscal year numbered about 15,700, or over 1,200 maps per month. This accession included occasional maps from all parts of the world, and some very valuable foreign sets of maps, included in which may be mentioned French, English, Italian, Russian, and Austrian staff maps of large

scale. Photographs and photographic map reproductions occupied a considerable part of the personnel during the fiscal year, resulting in the production of 18,000 prints and enlargements, 43,000 photostat prints, and almost 1,000 lantern slides.

This section furnished numerous maps to the American Expeditionary Forces in France, Russia, and Siberia, and was instrumental in supplying the Military Academy, training centers, and other military educational institutions with originals and reproductions of foreign war maps. The activities of M. I. 7 were not wholly limited to the Military Establishment, but it has been the means of supplying the War Trade Board, the Shipping Board, the Alien Property Custodian, the State Department, and the American Red Cross with map information.

Monograph Section (M. I. 9) — Handbooks. — This section is charged with the production of military monographs and handbooks of routes in selected foreign countries. During the fiscal year it has produced in printed form 10 complete handbooks, has completed 5 others which are either ready for printing or are being printed at the time this report is written. The majority of these handbooks treat of conditions in Siberia, Russia, and Poland, and were prepared for the use of our forces had penetration in the regions above mentioned been carried out. The later productions of the section consist entirely of handbooks on Mexico, of which one is in the hands of the printer, two are undergoing final revision, and others are being rapidly assembled and should be ready for final revision and printing within approximately two months.

A number of radical changes in the methods of collating and presenting of military information in the shape of monographs and handbooks have been worked out in this section during the fiscal year, chief among which is the line of demarkation between a monograph and a handbook. The handbook is regarded as tactical, presenting as it does detailed information regarding routes, railroads, cities, and terrain, while the monograph is strategic in nature, dealing in a broad manner with resources, economics, characteristics of the people, and many other subjects in which the General Staff of the military administration would be interested but which are only remotely related to the details of the conduct of military operations.

THE NEGATIVE BRANCH.

This branch collects, collates, and disseminates information upon which may be based measures of prevention against activities and influences tending to impair our military efficiency by other than armed force.

The branch was created on August 18, 1918, by uniting four existing sections. The sections so united were the Foreign Influence Section, the Army Section, the News Section, and the Military Morale Section. In September, 1918, the Travel Section and the Fraud Section were added. On October 19, 1918, the Military Morale Section became the Military Morale Branch of the General Staff. The organization at the time of the cessation of hostilities, when the branch had reached its highest point of development, consisted of five sections, as follows: Foreign Influence (M. I. 4); Army (M. I. 3); News (M. I. 10); Travel (M. I. 11); Fraud (M. I. 13).

At its maximum the branch employed the services of 202 officers, 60 enlisted men (Corps of Intelligence Police), 65 volunteers (candidates for commissions), and 605 clerks. It directed the activities of thousands of officers and enlisted men in the field and through this organization did the War Department's share in completely foiling the well-laid plans of the enemy to impede our military program. In addition, this branch effectuated direct savings to the Government which aggregate more than the entire appropriation for Military Intelligence.

A consideration of the functions of the several subdivisions of the branch gives a comprehensive view of its activities, which included the handling of cases during the current year in number closely approximating half a million.

The Foreign Influence Section (M. I. 4) is the present section from which grew the Negative Branch. As delimited by the diversion of specialties to other sections, the duty of this section in general is the study of espionage and propaganda directed against the United States or against its allies, and also the study of the sentiments, publications, and other actions of foreign language and revolutionary groups both here and abroad, in so far as these matters have a bearing upon the military situation. The activities of the section were carried on through seven subsections, as follows:

The Executive Subsection apportioned, supervised and coordinated the work of the section, determined questions of policy and represented the section in its relations with important officials.

The Departmental subsection studied the intelligence situation in the territories embraced within the several geographical military departments of the United States. It investigated enemy espionage and channels of communication, the financing of enemy activities and particular cases of enemy influence.

The Propaganda subsection studied and collated information on dissemination by the enemy of doctrines and false rumors aimed to create confusion of thought and so impair our military efficiency. It also studied and suggested methods for meeting and overcoming this imponderable mode of attack.

The Foreign Subsection studied the intelligence situation abroad and, in cooperation with the corresponding agencies of allied powers, determined the nature and extent of enemy secret activity and formulated methods for overcoming its effect.

The Legal and Liaison Subsection maintained liaison with the various Government agencies in Washington through officers familiar with the various departments. In addition, it systematically studied legislation, enacted or pending, proclamations, executive orders, and legal decisions affecting the Intelligence Service.

The Research Subsection took over from other subsections, cases which appeared to have reached unusual significance or importance, summarized all material information available and prepared such cases for final disposition.

The Labor and Sabotage Subsection handled all matters relating to the prevention or delay of deliveries of war materials by immobilization of resources, control of factories, or raw materials, subversion or intimidation of labor or physical damage to plants or products.

The Army Section (M. I. 3).—The function of this section is the organization, instruction and supervision of the Negative Intelligence Service within the Military Establishment; more specifically it protects the Army by the prevention and detection of enemy and disloyal activity among the military, including civilian personnel under military authority and in volunteer auxiliary associations. It supervises and coordinates the work of the Negative Intelligence officers stationed with each military unit and promulgates instructions for the operation and maintenance of the Negative Intelligence Service in the field.

The Executive Subsection coordinated the work of the section, assigned personnel and issued the bulletins and instructions which determined policy for the field organization. It also handled a variety of special and miscellaneous matters which did not fall within the province of another subsection. Among such specialties were the observation of conscientious objectors and of foreign church organizations and pacifist religious bodies operating among troops. The intelligence problems arising through the presence in the American Army of large bodies of Negro troops were studied in this subsection and much valuable information was secured and digested.

The Line Subsection cooperated with intelligence officers in line units in the field in investigating cases of disloyalty, sedition or enemy activity, either among troops or at points where troops were stationed. It also investigated and reported upon the antecedents and personal character for loyalty and integrity of candidates for commissions in the line of the Army. The duties of this section included not only the observations of dangerous tendencies or incidents arising within military units, but also those which operated from without directly upon the Army personnel.

Three other subsections performed for the technical and administrative corps and departments duties identical with those which the Line Subsection handled for the line of the Army. This work was grouped as follows: (a) General Staff, Judge Advocate General's Office, Adjutant General's Office, Corps of Engineers, Ordnance Department, Quartermaster Corps, and Motor Transport Corps. (b) Medical, Dental, and Veterinary Corps and the Chemical Warfare Service. (c) Signal Corps and Air Service.

The Personnel Subsection served all other subsections by conducting preliminary investigations of candidates for commissions and other persons under investigation, and so eliminated from further consideration all whose character for loyalty and integrity proved to be questionable. This subsection also performed a valuable service in detecting applicants for commissions in technical branches who had previously been rejected or discharged for cause from other branches of the service. One result of the investigations of this group was to prove the utter unreliability of letters of recommendation in estimating the fitness of individuals. Approximately 15,000 cases were handled during the emergency.

The Statistical Subsection, by means of maps and indexes, kept records of all military units in the United States and of the Intelligence organization of each; of the various cooperating agencies and of the status of the field service in general. It had custody of all literature issued by the section and attended to the mailing of cir-

culars, bulletins, and instructions. It coordinated the administrative work of the field and the office. This subsection maintained liaison with statistical offices of other branches of the War Department.

The Instruction Subsection studied the development of the Negative Intelligence system, evolved general principles and specific policies of general application and promulgated the result for the improvement of the service. It developed a well-considered plan for the personal instruction of Negative Intelligence officers, and prior to the signing of the armistice conducted schools for two groups of officers brought in from the field for instruction.

The Plant Protection Bureau.—This was a civilian organization which originated in the Air Service as a measure of protection for the airplane production program. It was taken over by Military Intelligence and its scope enlarged to include the protection of Government plants and construction projects as well as all private plants engaged in war work. This bureau systematically studied and inspected fire risks and made specific recommendations of measures for fire prevention. It organized watch and guard systems for plants engaged in Government work and provided watchmen where necessary. It also devised plans and furnished agents for detecting and preventing sabotage or other malicious interference with the production of war material. Approximately 5,000 plants were under the inspection of this bureau, which employed an operative force of 373 and supervised the activities of thousands of guards and watchmen. Offices were maintained at Boston, Springfield, New Haven, Bridgeport, New York, Albany, Syracuse, Buffalo, Newark, Philadelphia, Baltimore, Nitro, Atlanta, Nashville, Pittsburgh, Cleveland, Dayton, Indianapolis, Detroit, Chicago, Milwaukee, Minneapolis, Davenport, St. Louis, Fort Worth, San Francisco, and Los Angeles.

An important by-product of the activities of this bureau arose from its intimate knowledge of the operation of plants working on Government contracts whereby it was in a position to frustrate false claims and overcharges. No account was kept from which an accurate statement can be made of the total savings effectuated in this way. One item amounted to \$600,000, and the total is estimated as \$2,000,000.

Liaison with the American Protective League.—The American Protective League was a volunteer civilian organization of 300,000 members, operating under the supervision of the Department of Justice, and thoroughly covering the United States. By special arrangement with the Department of Justice this agency of information was placed at the disposal of the Military Intelligence Division, and to facilitate communication directly with the various local branches of the league a Liaison Subsection was created under the direction of an officer of Military Intelligence, who was also an officer of the American Protective League.

The News Section (M. I. 10).—On June 11, 1918, the Director of Military Intelligence was appointed to represent the War Department on the Censorship Board and the work incidental to this additional duty was at first handled in several sections of the Negative Branch. On August 16, 1917, the Director of Military Intelligence assumed the duty of Chief Military Censor and this section, which

was originally called the Censorship Section, was created to handle the increased volume of work entailed.

Censorship.—In practice it was found that much of the organization necessary to examine publications and communications for censoring served equally well for collecting and digesting current news in a manner which proved to be of great value to the War Department. As time progressed these informational functions became more and more important and when, with the close of hostilities, the censorship became unnecessary, this feature of the section, now called the News Section, was continued. At its maximum the section had 15 subsections, as follows:

The Executive Subsection coordinated and supervised the work of the section, handled necessary administrative details, together with miscellaneous matters which did not fall within the province of any other subsection, and maintained liaison with the boards of experts in other departments.

The Legal Subsection advised on the legal aspects of the censorship and recorded the precedents established upon rulings obtained from the staff of technical experts organized in the various bureaus of the War Department to cooperate with the Chief Military Censor.

The Postal Subsection maintained liaison with the Post Office Department and handled those matters which arose through the duties of the Chief Military Censor as War Department member of the Postal Censorship Board.

The Prisoner of War Subsection censored all mail to or from prisoners of war held by the United States in the several war prison camps and coordinated the work in this country with that done abroad.

The Telegraph and Telephone Subsection conducted the censorship of telegraph and telephone messages into Mexico during the period that the regulations were in force.

The Radio Subsection supervised the interception of radio messages originating in Mexico and through this service obtained much invaluable information regarding the activities and intentions of the enemy.

The Official Photograph Subsection censored all official motion and still pictures and made appropriate recommendations to the Signal Corps, the Historical Branch, and the Committee on Public Information.

The Commercial Motion Picture Subsection surveyed the private motion picture field for harmful propaganda or indiscreet revelations and in conjunction with Customs Intelligence censored the importation and exportation of films.

The Photographic Permit Subsection in cooperation with the Committee on Public Information handled the matter of official permits to make photographs on or about military camps and reservations.

The Press Subsection examined newspapers and periodicals to detect violations of the voluntary press censorship, advised the press regarding the suppression of information which might be of military value to the enemy, and attended to the accrediting of war correspondents.

The Foreign Language Press Subsection examined publications in foreign languages published in the United States and foreign language material entering this country.

The Book Subsection examined books, pamphlets, posters and all publications other than newspapers and periodicals, reported on such as were contrary to the interests of the United States, and recommended repressive measures where necessary.

The Propaganda Subsection examined periodicals and publications clearly engaged in propaganda activities for the purpose of ascertaining if their teachings were inimical to the interests of the United States.

The Digest Subsection prepared a daily news summary, a semi-weekly digest of editorial opinion for transmission to France, and a weekly press review for the Secretary of War.

The Clipping Bureau maintained a newspaper and magazine clipping service for all sections of the Military Intelligence Division and several other branches of the General Staff.

Travel Section (M. I. 11).—This section was created on September 23, 1918, by bringing together under one executive head several subsections from other sections. Its function consists of the study of normal travel and the application of the data thus secured to the control of travel into and out of the United States in time of war. From the beginning of the war the State Department relied upon the War Department for advice regarding all doubtful persons who made application for passports, and the proportion of these references steadily increased until at last no passport was issued unless the application had been cleared by the War Department.

Passports.—The passport regulations which became effective on September 15, 1918, confirmed this practice and laid upon the Military Intelligence Division additional duties in this regard. Seven departments of the Government were concerned in the regulation of foreign travel, but it was the duty of the War Department to make investigation of each individual for the purpose of determining his personal fitness, from a military standpoint, to enter or to leave the country. The volume of this work was very great, averaging, at its maximum, nearly 1,400 cases each day.

This section also supervised the work of the port control officers in this country and coordinated it with similar work abroad. The duties of the section were distributed among seven subsections, as follows:

The Executive Subsection supervised and coordinated the activities of the section, performed necessary administrative work, maintained statistical and geographical records, and kept in touch with the several Government departments interested in the control of foreign travel.

The Passport Subsection handled applications by American citizens (other than relief workers) for passports to leave the United States. It made sure that neither the applicant nor his sponsors had been adversely reported by any Government bureau and reported the facts to the State Department. The average number of such applications for the last four months of 1918 was 99 per day and the highest average for one week was at the rate of 265 per day. These applications were investigated and reported upon within three days from their receipt.

The Visé Subsection handled the matter of visés upon alien passports to enter this country and application for emergency passports by American citizens abroad. The cases handled for the last four months of 1918 averaged 45 per day and for one week averaged 111 per day.

The Alien Permit Subsection made the necessary investigations for the issuance of permits required by the passport regulations in the case of aliens departing from this country. The number of such applications in the last four months of 1918 averaged 246 per day and for one week rose to an average of 653 per day.

The Welfare Workers Subsection handled applications for passports by persons desiring overseas service with the several welfare societies attached to the Army (except the Y. M. C. A.). The uniform of such societies gave the wearer a semiofficial status in the eyes of foreign nations and rendered the Army responsible in case of an abuse of the extraordinary privileges afforded to these people abroad. After some unfortunate incidents arising from this source it was found necessary to make a thorough investigation in the case of each applicant before granting clearance. This was accomplished in an average of three weeks from the time of receiving the application. The number of these applications for the last four weeks of 1918 averaged 47 daily, and the largest week's average was at the rate of 166 per day.

The Y. M. C. A. Subsection handled the applications for passports by Y. M. C. A. workers, which averaged 47 daily during the last four months of 1918 and during one week averaged 169 per day.

The Liaison Subsection established communication with intelligence officers in this country, particularly at ports, and with military attachés abroad; exchanging information about traveling suspects and disseminating regulations for the coordination of travel control. Direct cable communication was maintained with American port-control officers in France.

The Fraud Section (M. I. 13) originated in the Quartermaster Corps in the spring of 1918, when at the request of the Quartermaster General an officer of Military Intelligence was detailed to organize a force to detect and prevent fraud and graft in the purchase and handling of quartermaster stores. On July 13, 1918, this force was transferred to the Military Intelligence Division and the scope of its duties enlarged to include the detection of any case of graft or fraud in or connected with the Army. At the beginning this group constituted a subsection of M. I. 3, but the work developed to such an extent that on September 24, 1918, it was made a separate section.

Fraud and graft.—Since becoming a section the rapid development of this work, both in volume and in the results accomplished, has continued. Since July, 1918, direct saving to the Government in cash refunded, property recovered, and claims reduced has been made to the aggregate sum of \$695,575.22, and cases now in hand are expected to yield a further saving of more than \$2,000,000. The section has investigated 1,230 cases, secured 558 arrests and 235 convictions; 924 cases are now pending.

In estimating the amount saved to the United States by the operations of this section, no account is made of the very considerable sum recovered as fines or of the probable savings by reason of the warning

to potential wrongdoers afforded by such a large number of convictions. The duties of this section were ultimately extended to include observation of the disposal of salvage in Europe, estimated to aggregate one and one-half billions of dollars in value.

The Military Morale Section had its origin in a subsection of the Army Section originally created to study the problems arising from the presence in the Army of a large number of soldiers who spoke and understood English with difficulty or not at all. On June 27, 1918, the duties of this subsection were extended to include the stimulation of morale generally throughout the Army; on August 18, 1918, it became a section and on October 19, 1918, it was detached from the Military Intelligence Division and became the Military Morale Branch of the General Staff. While still a part of the Military Intelligence Division, this section assembled a carefully selected personnel, established liasion with all military and civilian agencies whose cooperation would be useful in the psychological uplift of troops, laid down the basic plans for an organization to stimulate morale, carried on an extensive publicity campaign through the Committee on Public Information, and put into practice at Camp Gordon a plan of training foreign-speaking soldiers.

Field force.—During the emergency each military unit which constituted an independent command within the United States maintained its own Negative Intelligence organization under the immediate authority of the unit commander but acting in close cooperation with the Military Intelligence Division. There were more than four hundred such organizations. In addition there were maintained at New York, Philadelphia, St. Louis, St. Paul, New Orleans, and Pittsburgh, special Military Intelligence offices responding to the authority of the Director of Military Intelligence and employing an aggregate personnel of 45 officers, 80 enlisted men, and 120 civilians. These, together with the Intelligence organizations at department headquarters and ports of embarkation, constituted the principal branch offices of the Negative Intelligence system.

Demobilization.—Since November 11, 1918, the demobilization of the emergency force of the Negative Branch has proceeded rapidly. The Foreign Influence Section has been reduced to four subsections and the Army Section has been merged with it; the News Section now consists of but two subsections and the Travel Section is reduced to one officer. The Plant Protection Bureau is demobilized. The Fraud Section, on the contrary, is operating on a wartime basis and with increasingly effective results each month. The maximum of usefulness of this section does not appear to have been reached and a fruitful field for its activities will be presented for some time to come.

V. PURCHASE, STORAGE, AND TRAFFIC DIVISION.

The United States entered the war with only a partial conception of what it would mean to mobilize the Nation's whole resources for a single purpose, and without having worked out the concrete plans for achieving such an end. It was only by degrees that the country grasped the necessity for the assembling of its entire resources and it was only step by step that there was worked out the mechanism for accomplishing this end.

A few preparatory measures had been taken. The Navy, fortunately, had already achieved unity of organization. It had formerly operated under a bureau system similar to that of the Army, but this had given way to a unified organization which was to prove highly efficient under the strain of war. There was, however, no adequate machinery for coordinating the supply activities of the Army and Navy. Moreover, the carrying on of the war imposed new tasks for the performance of which it presently became necessary to create completely new emergency organizations independent of the existing departments of the Government.

The threat of the submarine to the world's shipping had already led to an appreciation of the necessity for a large shipbuilding program, and the Shipping Board and the United States Fleet Corporation were the agencies which had been created for the accomplishment of this end.

The shortage of tonnage and the necessity for controlling foreign trade, both as a means of directing the restricted flow of raw materials and of making more effectual the economic blockade of enemy countries, led to the establishment of the War Trade Board.

It was the submarine again, with its threat of starvation for England and France, which drove home the need for the United States Food Administration, charged with the control of the food problem as a whole.

The unprecedented war demands upon industry for the production of war supplies caused the creation of the Fuel Administration, which was made responsible for the production, distribution, and conservation of this fundamental of industrial output.

The necessity for operating the railroads of the country as a unified system to insure the uncongested transportation of men and materials led to all important lines being taken over by the Government and the creation of the United States Railroad Administration.

The Council of National Defense, which had been proposed as far back as 1911, was created by the act of August 29, 1916, seven months before the United States entered the war. It was not fully organized, however, until March, 1917, and while it was destined to play an important part in conducting the supply activities of the Government, it had to go through a long course of development before an efficient mechanism was reached for mobilizing national industry and for coordinating the activities of the numerous agencies through which the Government conducted the war. The council itself was composed of a group of six members of the President's Cabinet: The Secretary of War, the Secretary of the Navy, the Secretary of the Interior, the Secretary of Agriculture, the Secretary of Commerce, and the Secretary of Labor.

Provision was also made for a commission "advisory to the Council of National Defense," to be composed of men having special expert knowledge of industrial or natural resources.

During the course of the war the Council of National Defense and the advisory commission established a complex system of subordinate bodies to assist in the carrying out of their functions. It will be sufficient to mention here only three which have a special bearing on the story of the Purchase, Storage, and Traffic Division: The General Munitions Board, the Committee on Supplies, the Committee on Raw Materials.

The General Munitions Board, which functioned during the early stages of the war, developed later into the War Industries Board in July, 1917, and the President by letter of March 4, 1918, to its chairman, made it the great coordinating factor of the Government. The nature of the problems to be solved and the coordinating mechanism which was developed for their solution will be shown later. As the matter of military supplies stood first among those problems, it is necessary at the beginning to describe the supply organization of the Army as it existed in April, 1917, and as it developed during the ensuing months.

The Army supply system at the outbreak of the war.—The supply system of the Army of the United States was, prior to the present war, organized along lines of decentralization and consisted of a number of semi-independent bureaus but loosely coordinated either with the organizations of the line or with the staff of the Army and having practically no relations in common. The absence of correlation was further accentuated by decentralization of activities within the bureaus. Thus, within the Quartermaster Corps, by far the largest agency of this kind, operations were conducted by means of a considerable field force centering around the depot quartermasters, over whom the Office of the Quartermaster General in Washington had general supervision.

At the outbreak of war the supply bureaus of the Army were as follows: Quartermaster Corps, Ordnance Department, Medical Department, Corps of Engineers, Signal Corps.

The expansion of the War Department during the war to meet the need for new services led to the creation of several new bureaus, among which the following served as important supply bureaus: Construction Division, Chemical Warfare Service, Bureau of Aircraft Production. (Most of the purchasing for the Division of Military Aeronautics was done by the Bureau of Aircraft Production.)

A comprehensive statement of the duties and functions of the original supply bureaus, is probably not to be found anywhere. It is safe to say that even the statement of their duties as defined in United States Army Regulations is not complete and that there was considerable overlapping in regard to the procurement of supplies. The following, however, is a general indication of the supply functions of the five bureaus at the outbreak of the war:

1. The Quartermaster Corps: Subsistence, transportation, animals and vehicles, forage, camp and garrison equipage, clothing, construction of buildings, roads, bridges, ships, etc., retail stores at posts, **pay of the Army.**

2. Medical Department: Medical and hospital supplies.

3. Corps of Engineers: Certain construction, electrical supplies, engineering problems of supply routes.

4. Ordnance Department: Procured ordnance and ordnance stores, cannon and artillery vehicles, equipment and ammunition, personal and horse equipment and harness, ordnance tools, machinery, and materials, maintained arsenals and depots.

5. Signal Corps: All supplies connected with signaling, telephones, telegraph, balloons, airplanes.

The supplies needed for the support of the Army during the war were very much larger in amount than for the Navy, the Fleet Cor-

poration, and all other agencies concerned, and the system of Army supply by bureaus was responsible in large degree for the difficult problems of coordination which faced the Government in its task of mobilizing the national resources.

The declaration of war immediately induced the greatest activity in the five supply bureaus and put them under tremendous pressure for the adequate performance of their respective functions on the scale called for by the magnitude of the war. Their personnel was increased with great rapidity. Their structure underwent considerable changes made imperative by the great increase in their tasks. Each bureau felt keenly the duty imposed upon it of obtaining with the greatest speed possible the enormous mass of supplies and material needed for the conduct of military operations. They naturally proceeded along established lines, that is to say, as they were independently constituted, each bureau had its own duties to perform and set about those duties in the main without any adequate coordination with the other bureaus or with other governmental purchasing agencies.

The war, therefore, began with the supply system of the Army organized on the bureau plan, the bureaus being five separate purchasing agencies with separate systems of finance, storage, and distribution, each feeling itself largely independent within its own sphere of action, and accustomed by long habit and tradition to perform its various functions without reference to the activities of the others or of other departments of the Government. Accordingly, when the Army went into the Nation's markets to buy the vast body of supplies needed for the war, it went not as a single agency, seeing the problem of supply as a whole, but as five separate bureaus competing with each other, as well as with the other great agencies of the Government and of the Allies, for manufactured articles, raw materials, industrial facilities, labor, fuel, power, and transportation.

The Council of National Defense and the War Industries Board.—Some of the disastrous effects of such a system of competitive purchasing by numerous Government agencies in a war of such magnitude are apparent on the surface. In the case of purchases within a given industry, it has been generally recognized that large-scale purchases by the Government might completely disorganize the industry through absurdly high prices both to the Government and to civilians, and might at the same time fail to call forth in full measure the capacity of the country for the production of the particular article. It has been a matter of knowledge also that the process of placing orders for finished articles by bureaus and departments of the Government acting without a common plan tended to stimulate a scramble for raw materials which is equally disorganizing.

There were other aspects of the situation, however, which have not always been considered in connection with these. There was a competition for labor as well as for raw materials, and a resulting disorganization of the labor market, with great scarcity of labor in some regions and actual unemployment elsewhere. Furthermore, the unsupervised placing of war orders resulted in a congestion of contracts, both regional and relative to business firms. The total of contracts placed in a given region would outrun the utmost possibili-

ties of that region in the matter of manufacturing facilities, labor, fuel, transportation, power, etc. This was a corollary of the fact that individual firms would take contracts actually far in excess of their facilities or of their ability to obtain raw materials, labor, transportation, or new facilities. Moreover, the power to commandeer property was originally exercised by individual bureaus and departments without regard to its possibly injurious effect upon the war program of other bureaus.

The responsibility which rested upon each bureau and upon numerous divisions and subdivisions of the bureaus was to procure and deliver in France the particular supplies, materials, or munitions with which it was individually charged. In discharging this obligation each of these numerous agencies played a lone hand. Each naturally wished to show a record of large achievement in getting to France the particular things for which it was individually responsible. It was not an accepted principle early in the war, as it came to be later, that to preempt tonnage space for shipment in excess of actual current needs was, if anything, a greater offense than a failure to provide supplies according to schedule. The carrying capacity of the available ocean tonnage was at all times the neck of the bottle of supply. The system of individual procurement by bureau ignored this fundamental fact, and the natural result was congestion at the ports. This port congestion rapidly developed into a general congestion of railroad facilities, including very serious difficulties in the movement of fuel needed by war industries. An important contributing cause of the fuel shortage was the concentration of contracts in congested districts already referred to as a product of the bureau system of procurement. Other phases of the same problem were shortages of electric power and other power in certain of the congested districts. Moreover, in the carrying out of war contracts placed in the same particularistic way, new manufacturing facilities were frequently created or planned in congested areas which called for raw materials, transportation, and labor when at the same time elsewhere in the country adequate and unused facilities already existed. The outcome of all these difficulties was inevitably such a slowing down in the output of war supplies as resulted, in the worst days of the winter of 1917-18, in conditions approaching partial paralysis of the war machine.

The possible occurrence of such problems had been dimly envisioned in advance. The Council of National Defense had been proposed as early as 1911 with no war anywhere in sight. The council was actually established seven months before the United States declared war with Germany. Its final development was the powerful War Industries Board, which became the great coordinating agency of the Government in the matter of supplies. And within the Army organization the Purchase, Storage, and Traffic Division, with functions dovetailing into those of the War Industries Board, was created in the spring of 1918 for the purpose of effecting the same sort of coordination within the war machine, and came eventually, acting as the agency of the General Staff, to supervise and synchronize the supply activities of the Army bureaus.

But the highly efficient coordinating machinery which finally came into existence was developed only step by step as new phases of the problem of coordination presented themselves. As to the more

general agencies devised as outgrowths of the Council of National Defense or of its advisory commission, reference has already been made to the Committee on Supplies, the Committee on Raw Materials, and the General Munitions Board. The development of these three boards into a nicely articulated organization resulted in the War Industries Board, which stood at the end of the war at the apex of supply coordination. An outline of the development of this organization with which the Purchase, Storage and Traffic Division was closely related as the coordinating factor of the branch of the Government most vitally involved in the prosecution of war, forms a necessary prelude to an account of the later.

The Committee on Supplies which came into existence on February 12, 1917, was organized to cooperate in an advisory capacity with the purchasing officers of the War and Navy Departments in securing requirements of clothing, equipment, and subsistence. In its composition the regular principle was followed of selecting men in close touch with the particular industries concerned and thoroughly informed as to the conditions which would be encountered in the conduct of Government purchasing. The committee was therefore in a position to render service to the Government procuring officers. At the very outset, an order was issued by the Secretary of War under date of April 12, 1917, which suspended the peace-time system of advertising for bids. Under the new system the bureaus were advised by the Committee on Supplies as to the business concerns with which orders could best be placed, and in many instances mills and factories which had never before produced Government goods were induced to place their plants at the disposal of the Government. In these ways the difficult task of procuring clothing, equipment, and subsistence was greatly facilitated at the outset. Within its field of action also the Committee on Supplies endeavored to coordinate the procuring activities of the different bureaus and departments. It performed numerous other services of an advisory character, nearly a billion dollars worth of purchases having been arranged with its advice and assistance. This committee went out of existence in January, 1918.

Under the Committee of Raw Materials was organized a large number of advisory and cooperative committees appointed from the leading industries dealing with raw materials. The committees assisted in assembling trade information for mobilizing the sources of supply of the various raw materials. The Committee on Raw Materials was not a purchasing body, but it gave important advice and assistance in arranging for very large purchases by the Government departments. The committee acted by mobilizing the industries and then recommending to the Government purchasing agencies how best to utilize the facilities so provided.

The General Munitions Board began work on April 9, 1917. Its attention was directed particularly, though not exclusively, to ordnance, ordnance supplies, military vehicles, surgical supplies, optical glass, gauges, tools, and dyes. Its efforts were devoted toward the development of production facilities, the coordinating of Army and Navy purchases, the establishment of storage facilities, and the cantonment construction program, in all of which particulars its services were very useful to the procuring bureaus.

The board performed in a preliminary fashion important functions afterwards turned over to more completely specialized committees. Thus the work of the later Priorities Committee, the Clearance Committee, and Price-Fixing Committee had its beginnings in the early operations of the General Munitions Board.

In July, 1917, the General Munitions Board was transformed into the War Industries Board. This board in turn was completely reorganized by the letter of the President of March 4, 1918, and its powers at the same time were very greatly increased. By Executive order of May 28, 1918, the War Industries Board consisted, in addition to the board members themselves, of a considerable group of commodity sections or divisions and a set of boards and committees, each charged with a general function. Among the most important of the latter were the Priorities Board and the Priorities Committee, the Clearance Committee, the Price-Fixing Committee, and the Requirements Committee. The Commodity Sections were composed of men who had expert knowledge each of a particular commodity, and each section included in its membership representatives of the Government purchasing departments. The machinery thus developed was operating at the end of the war with a high degree of efficiency. The problems of coordination had practically all found adequate solution.

The passage of the Overman Act.—The economic embarrassments which confronted the Government during the initial months of the country's participation in the war, have already been mentioned. As cold weather came on, in the latter part of 1917, other difficulties developed. Shortages in clothing, hospital equipment, and other supplies led to hardships in Army camps. An epidemic of pneumonia also developed in the camps which was attributed by some to the shortages in clothing and shelter. About the same time, rumors began to be spread concerning serious failures to realize various parts of the program of supply which had been laid down. The ravages of the submarine were steadily cutting down available ocean tonnage, and great apprehension came to be felt as to the possibility of supplying the Nation's forces and those of our allies with adequate quantities of food and other things highly essential in the conduct of the war. Added to this the uncoordinated procurement activities of the Army bureaus and of the other Government agencies had resulted in excessive and unbalanced railway shipments which first overtaxed the port facilities and finally developed into an extremely serious congestion of the railroad systems. Connected with this was the shortage in fuel which was so widely felt both by the war industries of the country and the civil population. At the same time it became known that a great and final military drive by the Germans was being planned for the spring of 1918, and the whole situation led to a widespread feeling of uncertainty and uneasiness. This led very naturally to inquiry as to the efficiency being shown by the Government in the conduct of the war and to criticism, both destructive and constructive, of methods of production and organization in vogue.

This widespread uneasiness found its center and culmination in a congressional investigation of the conduct of the war, and on December 12, 1917, hearings were begun by the Senate Committee on

Military Affairs. Hearings continued until the end of March and during the whole time, in almost daily sessions, the committee heard testimony from the Secretary of War, the heads of the supply bureaus and others whose evidence was regarded as helpful in throwing light on the situation. The investigations served to give definite form to the various criticisms of the Government in its conduct of mobilization and supply, and also to bring out the Government's defense or extenuation of the progress of its program.

During the progress of the hearings a bill was introduced in the Senate providing for a ministry of munitions somewhat along the lines which had been followed in England and France. The proposed new agency would have been charged with the responsibility of supplying the requirements of the Army, Navy, Emergency Fleet Corporation, and the Allies. Another bill was introduced providing for a small war cabinet, to advise with the President and to direct, under a unified plan, the operations of the departments in the conduct of the war. These measures were consistently opposed by the War Department, which held that existing machinery should not be disrupted by such radical and comprehensive reconstruction, but that measures should be taken, and were being taken, for improving the coordination and efficiency of the various boards and departments. To facilitate the carrying out of this process, Senator Overman prepared and introduced the Overman bill, which finally prevailed, although it did not become law until May 20, 1918. This act, in lieu of creating a single agency for the conduct of all supply operations simply gave the President a free hand and complete power to readjust the existing framework of the Government.

During the hearings the chief items under consideration were clothing, hospital conditions at camps, shoes, rifles, machine guns, artillery ammunition, saddles, blankets, and gas masks. The measures taken by the War Department for the supply of these articles were fully discussed, the Secretary of War and other officials explaining difficulties which had been encountered, and claiming for the department on the whole, a high degree of success in meeting the difficulties which had been encountered. The most important phase of the investigation, in the present connection, is the criticism of the machinery which had been provided for carrying on the task of supply, and the official statement by the Secretary of War of organizational plans.

The criticisms of the Senate committee amounted to a vigorous indictment of what may be called the bureau system of supply under which supplies were being independently procured by the various bureaus of the Army and also by the Navy, Emergency Fleet Corporation, and the Allies. Great emphasis was laid upon the evils inherent in a system of procurement by a considerable number of separate agencies and the judgment was forcibly expressed, not only that the task of coordinating the activities of these various agencies was not being adequately performed but that the failure to accomplish this was threatening disaster in the conduct of the war as a whole. In regard to the War Industries Board the main objection was that it did not have legal or adequate powers to bring about effectually the coordination in the supply program which was clearly seen to be necessary, and that there did not exist anywhere

under the President any agency armed with adequate power for the achievement of this end.

It was pointed out that at most the War Industries Board could only advise the procurement offices of the various branches of the Government as to where and at what price to buy; that there was no compulsion upon these officers to take the advice offered and that the whole effort of placing orders and making purchases, mobilizing and speeding up industry, taking care of transportation, and planning out in advance, was scattered down through at least a dozen different agencies. It was also asserted that no matter what steps were taken to effect coordination within the War Department no solution of the problem would be reached on account of the necessity that would still exist of coordinating that department with other departments of the Government.

The demand, therefore, was for a war cabinet and also for a ministry of munitions, this ministry to be headed by a civilian who should be a business man of high ability. One phase of the criticism was that the supply program which was essentially a business operation, was being handled by military men whose training did not give them an adequate preparation for the task. The reply of the administration, given through the Secretary of War, was that arrangements had been made for bringing into the War Department, in positions of authority, business men of a high order of ability; that important reorganizations were under way in the Ordnance Department and Quartermaster Corps; that a wide extension of the functions of the War Industries Board was planned; that unified action in the field of transportation and embarkation of supplies had been provided by the appointment of a Director of Storage and Traffic with the Embarkation Service reporting to him; that the General Staff had been reorganized into five main divisions each presided over by an assistant to the Chief of Staff and each charged with the responsibility for a definite part of the war program, and finally that as one of these new divisions of the General Staff, provision had been made for a Director of Purchases and Supplies, whose functions within the War Department should be the coordination of the supply activities of the Army bureaus. A business man of large achievements had been appointed Surveyor General of Supplies to assist the Director of Purchases and Supplies in this task.

The program of the Senate committee was that the supply activities of the great purchasing agencies of the Government should all be combined under one man. The alternative plan of the administration was that the great agencies already in operation should be left undisturbed, but that more adequate mechanism should be provided for supervising and coordinating their activities and rendering them more efficient.

The successful passage of the Overman bill caused the alternative program for coordination to prevail. By means of the authority conferred by the Overman Act, it became possible to carry out without difficulty much that would have been difficult or impossible without such powers. The War Industries Board was developed into the single coordinating body of Government supply agencies and mobilized industries, and out of certain of the measures cited by the Secretary of War before the Senate committee was erected a similar

supervisory and controlling agency over the supply affairs of the War Department—the Purchase, Storage and Traffic Division of the General Staff.

ANTECEDENTS TO THE PURCHASE, STORAGE AND TRAFFIC DIVISION.

The Purchase, Storage and Traffic Division of the General Staff was created by General Orders, No. 36, War Department, April 16, 1918, to serve as a single agency for the coordination of the supply activities of the Army.

It has already been pointed out that this branch of the General Staff was the outgrowth of certain movements that had been going on within the War Department toward the establishment of supervision of the supply activities of the Army which would tie together its procurement functions and other collateral activities related to the distribution of supplies. The Purchase, Storage and Traffic Division resulted from an amalgamation of those antecedent agencies and it is necessary to trace their development into the single coordinating body. The first of these antecedent organizations was the Storage and Traffic Service.

The Storage and Traffic Service.—Army supplies for overseas, after leaving the factory, had to be transported on the railroad, in some cases stored in warehouses at the port of embarkation or elsewhere and finally had to be loaded on vessels and dispatched on their journey across the ocean. It was early seen that the existing agencies for performing these functions were not likely to prove adequate. In the matter of embarkation particularly it was obvious that independent action by the several bureaus would lead to impossible conditions, and that a single coordinating and controlling agency was called for which should handle the matter of embarkation for all ports and the Army as a whole.

To meet this need, the Embarkation Service was erected in the office of the Chief of Staff on August 4, 1917, by General Orders, No. 102, War Department, 1917, to take charge of embarkation matters for all supply bureaus of the Army. The officer in charge was designated as chief of the Embarkation Service. The principal organization change brought about by the establishment of this service was its effect upon the Water Transportation Branch of the Quartermaster Corps which had been at the outbreak of the war charged with the supervision of the entire operation of the Army Transportation Service. When in the early summer of 1917 the ports of embarkation were established, the authority of the Water Transportation Branch was somewhat subordinate to that of the commanding generals of the ports, the superintendents of Army transports at the ports being placed under the jurisdiction of the commanders of the port.

The effect of the establishment of the Embarkation Service was to attach the Water Transportation Branch to the former, although the latter continued as a separate entity. It may be said that the Embarkation Service performed certain of its functions through the Water Transportation Branch.

When the railroad congestion developed in the winter of 1917-18 it was appreciated that further steps were necessary for the proper handling of war supplies after they left the factory. By General

Orders, No. 167, War Department, December 28, 1917, therefore, the Storage and Traffic Service of the General Staff was created in charge of a Director of Storage and Traffic. The Embarkation Service, already in operation and reporting to the Chief of Staff, was transferred to the new Storage and Traffic Service.

One of the first measures taken by the Director of Storage and Traffic was to provide a War Department agency for supervising and handling transportation by rail. On January 10, 1918, a Director of Inland Transportation was appointed in charge of an organization which was first known as the Division of Inland Transportation and later as the Inland Traffic Service.

An agency was also established for supervision of all Army storage projects. The storage requirements of the Quartermaster Corps were approximately 80 per cent of the total storage requirements of the Army in the United States. The officer who had been in charge of the Storage Division of the Quartermaster Corps was given the title of the Director of Storage and placed in charge of one of the main divisions of the new Storage and Traffic Service. This arrangement was also natural, due to the fact that the Director of Storage and Traffic at this time was also Acting Quartermaster General. The task of the Director of Storage was to coordinate the storage activities of the bureaus, together with certain operating functions in the case of storage warehouses which were used in common by more than one bureau.

The organization of the Storage and Traffic Service was completed by the establishment of the executive office of the director and an administrative subdivision.

The Director of Purchase and the Surveyor General of Supplies.—Meanwhile a beginning had been made in the work of coordinating the procurement and production activities of the supply bureaus. Reference has already been made to the statement of the Secretary of War before the Senate Committee on Military Affairs, in which it was explained that there had been appointed a Director of Purchase and a Surveyor General of Supplies, to assist in the task of reviewing and systematizing the supply activities of the Army bureaus. The appointment of the former had been made by General Orders, No. 5, War Department, January 11, 1918.

It was out of the above elements that the Purchase, Storage, and Traffic Division was constructed. General Orders, No. 14, War Department, February 9, 1918, gives the entire organization of the General Staff as established at that time, including the five divisions of the General Staff, each one under an Assistant Chief of Staff. One of these assistant chiefs was the officer in charge of the coordination of purchases with the slightly altered title of Director of Purchases and Supplies, and another was the Director of Storage and Traffic.

By General Orders, No. 36, War Department, April 16, 1918, these two divisions were combined into the Purchase, Storage, and Traffic Division. The functions with which the office of the Director of Purchase and Supplies had been charged were taken over by a newly constituted Purchase and Supply Branch which became one of the four main parts of the new Purchase, Storage, and Traffic Division—the other three being Embarkation, Inland Traffic, and Storage.

These four continued to be the essential parts of the Purchase, Storage and Traffic Division for several months.

The history of these four branches will now be taken up one by one. The Purchase and Supply Branch was the last of the four to be established. Its development will nevertheless be outlined first, because the general reorganization of the Purchase, Storage and Traffic Division during the latter part of the summer of 1918 comes in as an essential part of this development.

The Embarkation Service, Inland Traffic Service, and Storage Branch were much less affected by the reorganization, and as a matter of presentation the account of each of those can best be given in its entirety after the reorganization arrangements have been explained as a part of the history of the Purchase and Supply Branch.

In connection with the plans of the new Purchase and Supply Branch, the office of the Surveyor General of Supplies was abolished.

ESTABLISHMENT AND ORIGINAL ORGANIZATION OF THE PURCHASE, STORAGE AND TRAFFIC DIVISION.

General Orders, No. 16, War Department, April 6, 1918, providing for the consolidation into one division of the General Staff of the Purchase and Supply Division and the Storage and Traffic Division, had the effect of the bringing together under one authority of all the coordinating machinery of the Army having to do with the procurement of supplies and their custody and distribution. The latter functions had been in operation, in one form or another, for some time. The coordination of procurement had been undertaken but a few months before the consolidation, under the Director of Purchase and Supplies, whose office, under the rearrangement, became the Purchase and Supply Branch of the Purchase, Storage, and Traffic Division. An account of its work of handling the fundamental problem of supply naturally precedes a description of the more collateral services of storage and distribution.

Report of the Committee of Three.—On April 2, 1918, shortly before the consolidation resulting in the Purchase, Storage, and Traffic Division was effected, a committee of three was appointed by the Acting Secretary of War to report on a plan of reorganization of the office of the Director of Purchases and Supplies so that it might function efficiently with the War Industries Board and the purchase bureaus of the Army and generally discharge all of the duties and perform all of the functions implied or expressed in General Orders, No. 14. This committee was made up of an officer representing the General Staff, a representative of the War Council, and a representative of the Council of National Defense.

The report of this committee which served as the basis of organization later developed in the Purchase and Supply Branch was an exhaustive study of the problem in all its ramifications. Its main features are as follows:

1. It gave expression to the undesirable results already disclosed as of the essence of the bureau system of supply, and the serious disaster which threatened the war program if the system were not speedily remedied.

2. It attempted to show the various relationships which the Division of Purchase and Supplies must necessarily have with (a) the

supply bureaus, (b) the War Industries Board, (c) other parts of the General Staff organization.

3. It enumerated and explained in order the particular tasks which necessarily fell within the functions of an agency, such as the Division of Purchases and Supplies, which might assume responsibility for the Army supply program.

4. It outlined the nature of the organization which should be set up in order that the division might adequately carry out these functions.

The Purchase and Supply Branch (which was still at the time the report was written the Division of Purchase and Supplies) was conceived as having relationships with the Division of Operations of the General Staff, with the Division of Storage and Traffic, with the War Industries Board, and, of course, with the supply bureaus of the War Department.

Its relation to the Division of Operations was in connection with the Army program. The Division of Operations was charged with responsibility for the formulation of the military program in terms of men and time, and the Purchase and Supply Branch was thought of as receiving the official Army program from the Division of Operations of the General Staff and transmitting that program to the supply bureaus in order that it might be used by the latter as the basis for the calculation of requirements for the resulting procurement of supplies necessary to carry out the program. Included in the tasks of the Purchase and Supply Branch would be the duty of bringing about in the bureaus a uniform and common interpretation of the Army program, so that there might be everywhere coordinated action toward identical ends.

The anticipated relations with the Division of Storage and Traffic were due to the possibility that shortages of storage space, traffic congestion, and other developments in this general field might possibly necessitate action, for example, the curtailment of production at some point of the procurement program under the jurisdiction of the Purchase and Supply Branch.

Relations with the War Industries Board were already being actively carried on by all of the supply bureaus of the Army. This hydra-headed appearance of the War Department in its contacts through the War Industries Board with the productive agencies of the nation had been up to this time one of the evils flowing from the bureau system, an evil which was complained of throughout the organization of the War Industries Board itself, and furthermore, as we have seen, an evil which had been attacked by the members of the Senate Committee on Military Affairs. The plan proposed to be substituted in all transactions with the War Industries Board was the single representation of the Army in matters of supply through the agency of the Division of Purchases and Supplies.

In the fourth place, and most fundamental of all, the very creation of the Purchase and Supply Branch was for the purpose of the relationships which it would maintain with the supply bureaus of the Army. In matters of supply it was to supervise these bureaus and work out the most effective plan for bringing about a perfect co-ordination of their activities. This was the very kernel of the problem, and in default of its successful solution it was felt that the whole supply program of the Army might be threatened with disaster.

As to the tasks which the new organization must of necessity undertake and the form of organization which must be provided for the performance of each of these tasks, they were expressed in the report as falling under the following heads:

Commodities.—Since the War Industries Board had developed an elaborate set of commodity sections it was appreciated by the Committee of Three that the Army must develop a somewhat similar organization to deal with the same set of commodities from the standpoint of the procurement problem of the Army.

Priorities.—It was felt that a definite organization was needed, through which the Purchase and Supply Branch might represent the Army in all priority questions handled by the War Industries Board.

Clearance.—Plans had been made for abolishing the Clearance Committee of the War Industries Board. It was recommended, however, that this committee be continued as a forum for the informal discussion of questions of short-time procurement.

Requirements.—The procurement function of the bureaus was conceived of as divisible into three great phases, the first of which was the calculation of Army requirements by the several bureaus.

Purchases.—The second great phase of procurement by the bureaus being the making of purchases, the Purchase and Supply Branch, as a coordinating and supervising agency, would need to erect a special purchase section specifically charged with supervision over this phase of bureau activity.

Production.—Similarly, as a third essential in a successful procurement policy was the following up and expediting of production, as there was need in the new organization for a supervising agency in this field.

Finance.—Since by General Orders, No. 14, the supervision and coordination of the financial operations of the bureaus had been made the duty of the Purchase and Supply Division, a special section for the performance of this task was recommended.

Standardization of contracts.—This was conceived as a separate function. Actually it was later included as one of the aspects of the supervision of purchases.

Replacements.—Numerous agreements had been made with the Allies under the terms of which they were to furnish various war supplies. In connection with these agreement the supply bureaus had assumed numerous replacement obligations; that is, obligations to replace the raw material involved in the supplies so furnished, or the making good in some other way of such replacement obligations as were involved in the transaction. A definite section or unit was recommended to handle these replacement obligations for the Army as a whole.

The initial organization.—When the new Purchase and Supply Branch was set up, plans were immediately made for an organization along the lines just indicated. As a matter of actual and formal organization, there were established to deal with the tasks defined in the report four fundamental sections.

The Supply Program Section was charged with general responsibility in the field of requirements, including the obtaining of the Army program from the Division of Operations, the general supervision of requirements calculations on the part of the bureaus, and

the representation of the Army on the Commodity Committee of the War Industries Board. The commodity specialists who became the representatives of the Army on the Commodity Sections of the War Industries Board were also placed under the jurisdiction of the Chief of the Supply Program Section. A special unit of the Supply Program Section was organized to handle the matter of replacements.

At the outset this section had four main tasks: The supervision of requirements calculations; the representation of the Army on the Requirements Committee of the War Industries Board; the supervision of the work of the Army commodity committees; and the supervision of replacement obligations, and later of purchase and sales relations with the French and British missions.

When the reorganization came in the latter part of August, the requirements function was transferred to a Statistics and Requirements Branch, and the Supply Program Section, with the new name—External Relations Branch—was charged with the responsibility for representing the War Department in all supply matters which involved contracts with other agencies. These relationships were mainly, of course, with the War Industries Board. They included the price fixing, clearance, and priorities functions, and the units which had been handling these matters were transferred to the jurisdiction of the External Relations Branch.

The Purchase Section was charged with numerous functions having to do with supervision of the purchase activities of the bureaus. Included within the Purchase Section also were set up units charged with: (a) The commandeering activities; (b) the appraisal of commandeered property; (c) the clearance of Army contracts, both as between the Army bureaus and also as to transactions arranged through the Clearance Committee of the War Industries Board; (d) the supervision of purchase and rental of real estate; (e) the standardization of contracts.

The largest single task of the Purchase Section was the consolidation of procurement. This work, as well as the other functions of the section, will be described later. It is sufficient to say here that it was a necessary preliminary to the carrying out of the main features of the reorganization in the latter part of the summer. As a part of that reorganization a Purchase Branch was established, which took over most, though not all, of the duties of the former Purchase Section.

A Production Section was organized somewhat later. The one change in the Production Section up to the end of the war was the change of its name to the Production Branch.

Under the terms of Supply Circular No. 80, August 27, 1918, the name of the Finance Section was changed to the Accounts Department. Its duties prior to this time were supervisory in character. When the Accounts Department was set up it was intended as an operating department in which would be consolidated the finances of all the bureaus. This plan was not carried out until early in October when Supply Circular No. 98 established the Finance Department with a Director of Finance in charge.

In addition to these four sections, each charged with a certain segment of the fundamental task of the Purchase and Supply Branch, there was also established an Administrative Section, and

an Emergency Section to take prompt action on emergency matters for which organization could not be provided in advance.

In the report of the Committee of Three it had been set forth with great emphasis that adequate statistical records of the procurement bureaus were indispensable to the functioning of the coordinating supply office. It was insisted that the director should have power to prescribe such records in detail for the bureaus, that there must of necessity be a constant flow of such statistical records from the bureaus to his office and that he must have direct and unquestioned access at all times to the primary statistical records of the bureaus; also that for the adequate performance of his duties he must have as a matter of organization a highly qualified statistical section as the mechanism for devising and instituting the statistical records essential to the operation of the office. A Supply Accounting Section was therefore organized.

When the Purchase, Storage and Traffic Division was reorganized the Supplies Accounting Section became the Statistics and Requirements Branch of the division. It took over from the Supply Program Section the supervising and coordinating of requirements calculations in the supply bureaus, in which work it was successful in bringing about the establishment of a uniform system.

Effect of the reorganization on the Purchase and Supply Branch.—Reference has already been made to the reorganization which was effected in the latter part of the summer of 1918. The nature of this reorganization, the causes leading up to it, and the process by which it was effected are explained in connection with the account of the Purchase and Supply Branch whose work it most closely affected.

During the course of the hearings before the Senate Committee on Military Affairs, the Secretary of War, in explaining his plans for improving the efficiency of the supply system, made the statement that the complete consolidation in a single agency of the procurement activities of the supply bureaus (with the exception of highly technical articles) was a matter then under consideration. Such a consolidation, while it probably would not have met the extreme wishes of critics, would have gone a long way in that direction by concentrating, under one man, the procurement of the great bulk of war supplies. There were difficulties, however, in the way. The opposition to any such plan on the part of the chiefs of the bureaus especially could be counted upon. Their opposition was founded upon the natural feeling that any sweeping reorganization of the existing procurement machinery might operate to disorganize the bureaus, which, they claimed, except in certain particulars, were already functioning effectively and furnishing the American Expeditionary Force with supplies.

Early efforts were confined purely to supervision and correlation rather than reorganization of the bureau machinery, though at the same time the work of consolidating procurement was being taken up article by article.

Early in the summer of 1918, following consultations between the chief members of the staff of the Director of Purchase, Storage, and Traffic, the chiefs of supply bureaus and others, tentative plans for a consolidated service of supply for the United States were formulated.

These plans were embodied in an important memorandum which, on July 18, 1918, was presented by the Director of Purchase, Storage and Traffic to the Chief of Staff for approval.

Even this plan did not contemplate the complete merging of all procurement activities. Ordnance, aircraft, and certain other highly technical material of special and changing design and peculiar use was excepted from the plan of centralization, though not from centralization of storage, traffic, and embarkation. Briefly, there was to be a central agency for the procurement of all standard articles of Army supply (except technical articles) and for the centralized administration of all distribution, including storage, rail and water transportation, and embarkation.

The plan was presented to the chiefs of the supply bureaus for criticism. Under date of August 26, 1918, the plan was approved in principle, and authority was granted to outline the successive organizational changes which would be involved. The plan as submitted was disapproved to the extent that the Construction Division was to remain under the Division of Operations of the General Staff.

The plan as approved, together with an explanation of the early stages of the reorganization as it was actually carried out, was presented in Supply Bulletin No. 29, issued November 7, 1918.

The following is a condensation of the organic weaknesses of the bureau system of supply as it existed up to the time of the reorganization:

1. Combination of supply functions and operating functions.
2. Nine independent responsibilities for supply.
3. Nine separate and nonuniform systems of (a) requirements, (b) purchase, (c) storage, (d) distribution, (e) fiscal accounting, (f) property accounting.
4. No uniformity in the various bureaus as to functions: (a) The Bureau of Aircraft Production was a pure purchase bureau having no function of operation and no other function of supply; (b) the Ordnance Department was a supply bureau with no function of operation; (c) Military Aeronautics and Coast Artillery were purely operating services with no or a negligible function of supply; (d) the Engineer, Medical, and Signal Corps were both operating and supply bureaus; (e) the Quartermaster Department was an operating bureau and supply bureau.
5. No uniformity as to method, organization, practice, and nomenclature.
6. Purchase and Storage were not operated as they should be on a suitable commodity classification.
7. At least five independent conduits of supply reaching from primary sources to ultimate points of use. This made impossible a proper synchronizing in supply of articles of a related use.
8. The combination of supply and operating functions prevented an adequate supervision of supply.
9. The supplies even for a minor unit of troops came from a number of bureaus.
10. The bureau system prevented a uniform storage system for the Army as a whole.

11. Plurality of supply organizations had the following tendencies and effects: (a) Fostered competition between Government purchasing agencies; (b) prevented lower prices for increased or bulk

orders; (*e*) resulted in groups of single similar tasks too small for the best man and too large for the mediocre man; (*d*) multiplied personnel; (*e*) confused organization and rendered supervision difficult; (*f*) multiplied types, quantities, and design of standard articles, thus creating confusion and lack of interchangeability in supply; (*g*) prevented uniformity of nomenclature, method, and practice; (*h*) prevented procurement and accumulation of reserves of articles of related use in step with the Army program and with available facilities for shipping and storage; (*i*) resulted in five separate sets of property accountability for line officers, all different and all unnecessary; (*j*) prevented proper distribution of production fields and of assembly and storage depots; (*k*) resulted in conflicting and unknown requirements.

The organization of supervising and operating units set up under the reorganization to remedy or improve these conditions will be described later. It will be noted here that the former Purchase and Supply Branch disappeared, its various component units finding a new arrangement.

The tasks of the Purchase and Supply Branch.—The development of the Purchase and Supply Branch from the point of view of organization has already been outlined. The tasks which this organization undertook to perform will now be considered one by one.

Requirements.—The first of these is the supervision of the calculation of Army requirements. For a large number of articles required by the Army the fundamental data needed for the calculation of requirements are:

First, the military program in the terms of men and time.

Second, table showing the organization of the Army into its fighting units.

Third, unit equipment tables.

In the case of certain special articles, special projects are necessary. For the larger part of the work of calculating requirements, however, the starting point is the Army program. This Army program the Purchase and Supply Branch was to obtain from the Division of Operations of the General Staff, where it had its origin, and it was the duty of the Purchase and Supply Branch in turn to pass this program on to the supply bureaus, to make certain that it was given uniform interpretation in the bureaus, and in general to supervise the process by which requirements were calculated.

Among the various reasons which made this supervision of requirements imperative was the fact that where shortages existed either in finished articles, raw materials, or production facilities, it was necessary for the War Industries Board, in the performance of its duty of insuring adequate supply facilities, to have this information in regard to the requirements of the Army as a whole.

When the requirements work of the Purchase and Supply Branch was begun the authorized programs already in use were out of date, due to the great acceleration of troop shipments which had begun as early as April, 1918, in response to appeals from the Allies which were based on the situation at the fighting front. It was a very difficult matter, because of the shortage of tonnage and numerous other considerations, for the Army to adopt an authoritative program covering the new undertakings in the matter of sending troops to France.

Particularly was it difficult to project that program in any reliable way for a year or two years in advance, no matter how desirable this might be from the point of view of the necessity of making arrangements for certain materials considerably more than a year in advance of the time finished articles must be ready for use.

The enlarged Army program was announced July 25, 1918. Even this program was projected only through June, 1919, and it was not until September 3, 1918, that the authoritative projection of this program into the year 1920 could be officially adopted. For at least two months, therefore, requirements work was necessarily preliminary and tentative. Not until the latter part of the summer did it become possible to calculate Army requirements on an authoritative program projected sufficiently far into the future.

The work of supervising requirements calculations in the bureaus consisted in:

(a) The establishment of such requirements units where they did not exist and their development where they were not adequate.

(b) The adoption of adequate and uniform blank forms for the calculation and submission of calculated requirements as well as of the basic data underlying them. This included the laying down of numerous rules governing reserves, fundamental allowances, antedating to allow for shipment from factory delivery to point of issue in France.

(c) The combining, where necessary, of the requirements from various bureaus into total figures for the Army.

(d) The transmission of final results to the War Industries Board as well as to other parts of the Army organizations.

In carrying out this work two fundamental units were organized—one for articles of issue, the other for raw materials. The Ordnance Department and the Quartermaster Corps alone had developed effective organization for the calculation of requirements for articles of issue. Nowhere in the bureaus had units been established for the conversion of such requirements into terms of their raw material content, yet it was necessary for the War Industries Board to know, not only the requirements of finished articles, such as shoes and uniforms, but also the amounts of leather of various kinds, and the amounts of wool, etc., which were involved in making the final products.

The task of establishing and developing adequate units in the supply bureaus for the calculation of requirements was difficult, due to scarcity of qualified personnel and the difficulty of securing uniform practice.

Incidental to the reorganization of the supply system in the latter part of the summer of 1918 there occurred a consolidation of bureau requirements units in the office of the Director of Purchase and Storage (the establishment of which is described later). The Requirements Division of the Office of the Director of Purchase and Storage took over the calculation of requirements for those articles formerly handled by the Quartermaster Corps, and for all nontechnical articles formerly handled by the Corps of Engineers, Medical Department, and the Signal Corps. This was in accordance with Supply Circulars Nos. 101, 102, and 103, which represent steps in the carrying out of the general reorganization. Looked at broadly, this

change was a step in the direction of consolidation in one central office of all requirements calculations for the Army. It was a development, however, which was interrupted in midcourse by the signing of the armistice.

Rules and regulations for the calculations of requirements were given to the supply bureaus in Supply Circulars Nos. 69 and 70.

In summary it may be said that shortly before the armistice was signed the calculation of requirements for the Army as a whole had been placed upon a solid and systematic basis.

Commandeering.—During the latter part of 1917 and the first part of 1918, it became necessary for the War Department to exercise the right of requisition to a considerable extent in order to secure promptly supplies and equipment and other property needed for war purposes. Great confusion existed in connection with such seizures. Adequate records were not maintained and complete reports could not be secured without months of investigation. Property was requisitioned at the request of the War Industries Board for private manufacturers without the knowledge of any department or bureau of the War Department, and by reasons of incomplete reports and in some cases loss of original documents the owners of property were at times deprived for an unreasonable time of just compensation.

The matter became acute, and in February, 1918, the Secretary of War instructed the Director of Purchase and Supply to make a complete report on all property requisitioned by the War Department. A partial report was made on March 1, 1918. On March 22, 1918, General Orders, No. 27, was issued, directing that in order to establish uniformity of procedure in requisitioning and commandeering property and to insure consistent consideration of the questions arising thereunder the Director of Purchase and Supply should:

- (1) Sign all requisitions and compulsory orders by direction of the Secretary of War.
- (2) Promulgate rules, regulations, and instructions with reference to the preparation, application, or use, issue, service, and recording of requisitions and compulsory orders.
- (3) Formulate the methods of determining values of property taken and compensation to be paid therefor.
- (4) Authorize payment or other settlement for such property.
- (5) Require such reports to be rendered as, in his opinion, may be necessary.

The Commandeering Section was thereupon established and charged with the administration of (1), (2), and (5), above. This section was carried over through the various reorganizations which later took place.

On March 30, 1918, the Division of Purchases and Supplies issued its Order No. 1 prescribing regulations for the preparation, transmission, service, and return of requisitions and compulsory orders, reports thereon, and the determination of just compensation therefor.

On April 1, 1918, General Orders, No. 30, constituted the Board of Appraisers, charged with the duty and responsibility, primarily, of determining just compensation to be paid for all property taken or used by the War Department during the existing emergency.

The statutes under which property was requisitioned or secured on compulsory orders were as follows:

- (1) Section 10 of the food-control act, also known as the Lever Act (H. R. 4961, public No. 41), approved August 10, 1917, author-

izing the requisitioning of foods, feeds, fuels, and other supplies necessary to the support of the Army or the maintenance of the Navy, or any other public use connected with the common defense, and the requisitioning of storage facilities for such supplies. The procedure under this statute was termed "requisitioning" and applied to existing property of the character indicated.

(2) Section 120 of the national-defense act (H. R. 12766, public No. 85), approved June 3, 1916, authorizing the placing with any manufacturing establishment of compulsory orders for the production of products or materials of the nature and kind usually produced or capable of being produced by such firm on the payment of just compensation.

The Commandeering Section was charged with responsibility as follows:

(1) To establish the records of all transactions which occurred prior to March 22, 1918.

(2) To exercise administrative control over all subsequent transactions and in so doing to take action as follows: (a) Standardization of administrative methods; (b) consistent consideration of the policies of the War Department and of the local questions involved with respect to taking property by summary process; (c) the compilation of complete statistics; (d) the completion of files to be available after the war for use in such litigation as may ensue.

Board of Appraisers.—In close connection with the work of the Commandeering Section was that of the Board of Appraisers. This board was established and its powers and duties defined by General Orders No. 30, War Department, April 1, 1918. The board was constituted of five members, each having rank of lieutenant colonel. The board had also a judge advocate with similar rank and a recorder with the rank of major.

The primary function of the board was stated as follows:

To determine, by appropriate methods, just compensation for property of whatever kind, real, personal and mixed, or for use, possession or occupation of any such property, (1) which shall hereafter during the existing emergency be ordered, requisitioned, commandeered, or otherwise summarily taken over according to law, through, by or by direction of the Secretary of War for the direct and special use of the Army; or (2) which has heretofore, during the present emergency, been thus taken over and the determination of just compensation for which has not been concluded, or is not under consideration by a special board of assessors.

The use of the requisition process by the bureaus in the early months of the war was attended by uncertainty and confusion, by diversity of practice, and by a lack of records which subsequently made the work of the Board of Appraisers very difficult. In many instances it was difficult even to determine just what property had been taken and by whom it was owned.

For the purpose of making an award it was found by experience that little or no reliance could be placed on the formal receipt executed by the officer serving the process and indorsed on the back of the requisition. In some cases, the organization issuing the requisition process failed to understand that it was without authority to make payments. Consequently, inquiry was necessary in every case as to whether payment had been made in whole or in part. It is obvious from this recital that, in the matter of commandeering and

appraisal, the system of independent army bureaus was the cause of a great deal of difficulty and uncertainty in regard to obligations incurred by the Government. With supply in the hands of a single purchasing agency the situation would have been quite different.

Boards of Contract Review.—On June 14, 1918, a Surveyor of Contracts was appointed by the Secretary of War. The Surveyor of Contracts had close relationship with the Director of Purchase and Supply, and in the reorganization of the Purchase, Storage and Traffic Division he was placed in charge of the Purchase Branch of that Division in addition to performing the duties of his original office. His first duty as Surveyor of Contracts was to establish in each supply bureau a Board of Contract Review, charged with duties as follows:

1. To approve or disapprove of the final form of proposed purchase transactions, bearing in mind particularly the necessity of protecting the interests of the Government as to price, terms, and conditions in the following classes of cases: (a) All awards over \$5,000; (b) all cost-plus transactions; (c) all awards where in cases of formal competitive bidding the award was recommended to anyone other than the low bidder; (d) such other classes of cases as the board considered desirable, or as might, from time to time, be designated by higher authority.

2. To consider questions of purchase and contract policy within the bureau.

These boards generally consisted of five members, including a representative of the Finance Section. Minutes were kept showing the action taken at each meeting, and copies thereof were originally transmitted for scrutiny to the Surveyor of Contracts and later to the Purchase Branch.

Such a board was already operating in the General Engineer Depot. Similar boards were established in the seven other supply bureaus during the period from July 8 to July 26, 1918, after conferences between the Surveyor of Contracts and the supply bureaus affected. On August 16, 1918, Supply Bulletin No. 21 on "Boards of Contract Review in Supply Bureaus" was issued, giving official recognition to what had been accomplished.

These boards proved of great value in scrutinizing all transactions of importance before they became effective, and in carrying out, in the supply bureaus in uniform and consistent manner, the contract and purchase policies established by the department.

The local boards having all been organized, the Superior Board of Contract Review was constituted, consisting of the Director of Purchases and Supplies as chairman, the Surveyor of Contracts, and either the chief procuring officer or a member of the Board of Contract Review of each supply bureau. Generally, although not in every instance, the chairman of the local Board of Contract Review represented the bureau on the superior board. The personnel of the superior board varied from time to time as reorganization took place in the Purchase, Storage, and Traffic Division.

The Superior Board considered the form and policy of contracts and other matters referred to it by the various bureaus and higher authority, and in general acted in an advisory capacity on the contracting and purchasing policy of the War Department. Among the more

important matters on which the board made its recommendations were the following:

1. Uniform contract provisions: On May 31, 1918, the Director of Purchase and Supplies appointed a Committee on Contract Standardization, consisting of representatives of all supply bureaus. This committee was charged with the duty of considering and recommending contract provisions on all subjects normally covered in contracts of the War Department, with a view to the establishment, in so far as possible, of uniform contract provisions for the different supply bureaus of the War Department. On August 6, 1918, the committee presented its final report.

2. Cost-plus contracts.

3. Publicity of War Department contracts and awards.

4. Increased manufacturing facilities.

5. Discounts for prompt payment of bills.

6. Workmen's compensation insurance.

Supervision of purchase methods and transactions.—Considerable attention was given during May and June to the drafting of a form upon which the supply bureaus might make regular reports to the Purchase and Supply Branch of the essential features of certain kinds of contracts.

Supply Circular No. 46, issued on July 6, 1918, required the bureaus to forward regularly on the forms provided, abstracts of their contracts and orders in the following classes of cases:

1. All orders or contracts amounting to \$1,000,000 or over in estimated or actual value.

2. All orders or contracts of any amount placed on any other basis than that of a straight fixed price subject to no adjustments.

3. All orders or contracts of any amount involving the creation of any new or additional facilities.

When the Purchase Branch succeeded to the function of the Purchase Section, examination and action on these abstracts was a duty with which the Methods Section was charged.

These abstracts of contracts proved to be of very great value in the administration of the department's purchasing policy. Among the results accomplished by the inspection of purchase methods were the following:

Increased competition and publicity.

Development of new sources of supply.

Reduction in number of cost-plus contracts.

Reduction in number of contracts in which price was left open to future negotiation.

Reduction in number of contracts in which price was based on cost of first 10 to 15 per cent of article mentioned.

Effective administration of system of cash discounts for prompt payment of bills.

Sales of property.—Immediately after the termination of hostilities the matter of sale of surplus stocks of war supplies became very urgent. Discussion of this important matter will be given in its proper place. The question of sales of certain kinds had, however, been taken up at an earlier date. War Department Bulletin No. 50, August 31, 1918, provided substantially that supplies, the value of which exceed \$5,000 would not be sold by the bureaus unless the ap-

proval of the Director of Purchase, Storage, and Traffic had first been secured. The handling of such cases was a special duty with which the Methods Section of the Purchase Branch was charged. The work inaugurated in this way was a useful preparation for the very much more extensive work in connection with sales which developed after the armistice.

New facilities.—On September 16, 1918, there was established a unit for the purpose of scrutinizing the contracts theretofore made by the various supply bureaus of the War Department involving the construction of new facilities to be paid for by the Government. At the time the armistice was signed, detailed studies of a number of the more important contracts had been completed and steps were under way to secure a modification of these contracts in the interest of the Government. In performing this work, the Methods Section was in constant touch with the Director of Munitions and the Assistant Director of Munitions.

On October 21, 1918, the Methods Section was directed to make a thorough investigation into the methods employed by the various supply bureaus of the War Department to safeguard the interest of the Government with reference to the care and ultimate disposition of tangible property and other rights acquired by the Government incident to and in connection with contracts of the War Department for materials and supplies. Conferences were promptly held with the various supply bureaus affected and the collation of these data was well under way when the armistice was signed.

Standardization of matériel.—The bureau system of procurement had occasioned a great heterogeneity in Army supply which was a great source of expense and also wasteful of cargo space and labor. To a great extent it was capable of remedy by standardization of types and specifications. To accomplish this end a unit was set up. The work of this unit included the reduction, insofar as possible, of the numbers, sizes and types, also of shades, colors and finishes of articles purchased by the Army; the simplification and coordination of specifications of the various supply bureaus for the same article, and the preparation of new specifications where none of an adequate nature existed. The personnel of this standardization unit was small, for it availed itself of the assistance of a large number of representatives of the various supply bureaus, the Bureau of Standards, technical and scientific societies, the committee of the War Industries Board and the representatives of the industries affected. A large number of general committees and subcommittees were established for carrying on this work of standardization. These committees did a large amount of highly important work. As rapidly as their work of standardization was accomplished the new specifications were given to the bureaus and purchase under them was commenced.

It is impossible to give an adequate idea of this work of standardization in any other way than by a lengthy enumeration. An abiding conviction of the wastefulness of a system of uncoordinated purchase by separate bureaus could not be gained in any way better than by a detailed study of the conditions found to exist by the standardization committees and of the work done by them to remedy the situation.

A single instance will serve to illustrate what took place in innumerable cases and the possible savings involved. The subcommittee on standardization of hand tools and hand chests made a reduction in the number of general tool chests used by the various divisions in the Army from approximately 77 to 7 types which were smaller and less expensive than the replaced types. The subcommittee estimated the saving in cost and freight charges on one order alone of approximately \$5,000,000.

Contract adjustment.—For some time it had been evident that it would be of great value to establish in the War Department an agency with authority to determine promptly and without reference to legal technicalities such doubts, claims, and disputes as might arise under contracts of the War Department in cases in which the contractor and contracting officer were unable to agree. It was believed that the establishment of such an agency would be very desirable not merely for the determination of such doubts, claims, and disputes as might arise during the progress of the war, but also, very particularly, to determine such claims of contractors as might arise when, on the cessation of hostilities, it might become necessary for the War Department, in the public interest, to terminate large numbers of outstanding contracts and orders.

In suggesting to the Director of Purchase, Storage and Traffic standard contract provisions for insertion in the contracts of the War Department, the Superior Board of Contract Review gave particular attention to this subject and recommended the mandatory insertion in all contracts of the following provisions on "Adjustment of claims and disputes":

Except as otherwise specifically provided in this contract, any claims, doubts, or disputes which may arise under this contract, or as to its performance or nonperformance, and which are not disposed of by mutual agreement, may be determined, upon petition of the contractor, by the Secretary of War or his duly authorized representative or representatives. If the Secretary of War selects a board as his authorized representative to hear and determine any such claims, doubts, or disputes, the decision of the majority shall be deemed the decision of the board. The decision of the Secretary of War or of such duly authorized representative or representatives shall be final and conclusive on all matters submitted for determination: *Provided*, That where the decision is rendered by such representative or representatives, the Secretary of War may, at his option, either upon his own motion or upon petition filed with him by the contractor within 20 days after notice of the decision of such duly authorized representative or representatives has been served upon him, review the action of such representative or representatives and render his decision thereon. Any sum or sums allowed to the contractor under the provisions of this article shall be paid by the United States as part of the cost of the articles or work herein contracted for and shall be deemed to be within the contemplation of this contract.

These provisions were incorporated in Supply Circular No. 88. It was also anticipated that in the case of earlier contracts not containing reference to such adjustment of claims and disputes the contractors might nevertheless desire to avail themselves of the assistance of a board acting promptly and on equitable principles.

On August 29, 1918, the Secretary of War approved a recommendation of the Director of Purchase, Storage and Traffic that such a board be created and directed that the necessary steps be taken. On November 6, 1918, after certain difficulties incident to organization had been overcome, the War Department issued General Orders, No.

103, establishing in the Purchase, Storage and Traffic Division of the General Staff a Board of Contract Adjustment, constituted and charged with duties and vested with powers as therein described.

The board consisted of those members who were nominated by the Director of Purchase, Storage and Traffic and appointed by the Secretary of War. The members were commissioned as lieutenant colonels. The board was charged with the duty of hearing and determining all claims, doubts, and disputes, including all claims of performance or nonperformance, which might arise under any contract made by the War Department. The board was authorized to adopt its own rules of practice and procedure. Investigations might be conducted either by the board as a whole or by individual members or examiners designated for that purpose, but findings and decisions were made only by the board acting through a majority of its members. The findings and decisions of the board were final and conclusive, subject only to review by the Secretary of War.

It was assumed that in practically all cases contractors whose petitions were heard by this board and who received a fair and impartial hearing from the board would be satisfied with its awards and would thus be able to secure prompt payment of their claims without the necessity of availing themselves of the assistance of the Court of Claims.

While the establishment of this board would, in any event, have been regarded as a desirable and constructive step, it was a matter of fortunate foresight that it was established and ready for business prior to the time when the cessation of hostilities made it necessary in the public interest for the War Department to terminate large numbers of outstanding contracts and orders.

Commodities.—Very early in the war representatives of the various supply bureaus of the Army and of numerous subdivisions thereof found it desirable to get in touch with various committees and organizations set up by the Council of National Defense, the General Munitions Board, and the later War Industries Board, but the relations so established were haphazard and extremely unsatisfactory for the reason that they did not provide for a uniform presentation of the needs of the Army as a whole, for the respective supplies, materials, and munitions called for by the Army program.

Under the final form of organization taken by the War Industries Board, an elaborate set of commodity sections was created each under chairmanship of an expert with special knowledge of a particular commodity or type of industry. The fundamental responsibility for the planning of supply on a large scale and well in advance of developing means, as well as for such matters as the proper distribution of orders throughout an industry, rested with these commodity sections. The establishment of the Purchase, Storage and Traffic Division of the General Staff made it possible to systematize the contacts of the various parts of the War Department organization with these commodity sections.

Shortly after the creation of the Purchase and Supply Branch, a series of Army commodity committees was created to parallel and to function with the commodity sections of the War Industries Board. Each Army committee was made up of representatives from the various supply bureaus interested in the particular commodity in ques-

tion. The personnel of these committees was, in the first instance, nominated by the bureaus concerned. Each committee had as chairman a representative of the bureau whose interest happened to be the largest, and the men who served as chairman of these commodity committees served also as members of the respective commodity sections of the War Industries Board, where each represented the Purchase, Storage and Traffic Division—that is to say, the Army as a whole.

The personnel of these Army commodity committees consisted very largely of officers who had already been in contact with the War Industries Board organization—each, however, as the representative of a particular bureau or subdivision thereof. The new organizations without disrupting these valuable relationships already established, reduced them to a uniform system which furnished a stronger guarantee that the needs of the Army would be adequately presented and which immensely simplified the problem of the War Industries Board at its numerous points of contact with Army needs. General supervision over the work of the commodity committees was entrusted to the Supply Program Section and later to the External Relations Branch which succeeded it.

It is impossible within brief limits to give any adequate account of the extent, the character, or the importance of the negotiations carried on through the instrumentality of these committees and through the memberships of their chairmen on the respective commodity sections of the War Industries Board. A record of this work which is really the whole story of the economic mobilization of the Nation's resources, has been preserved in the minutes of the commodity committees and of the commodity sections of the War Industries Board. An account has also been given in final reports of the chiefs of the several committees and sections.

The original constitution of the Army commodity committees is referred to in paragraph 14 of Supply Circular No. 1, April 24, 1918. The duties of the committees and their chairmen were stated in Supply Bulletin No. 8, April 23, 1918, and restated with great elaboration in Supply Bulletin No. 22, August 28, 1918.

It was through the contacts of the chairmen of the Army commodity committees with the commodity sections of the War Industries Board that plans were worked out in amplification of detail to assist the Army through the facilities of the War Industries Board in meeting the urgent and rapidly changing needs of the Army supply program. If the United States should ever again be involved in a war comparable in magnitude with the recent war, one of the first steps which would need to be taken would be the reconstitution of a set of commodity committees similar to those which served the Army during the late emergency. This should be done in any event, whether or not an organization similar to that of the War Industries Board is to be created. The chaotic relationships which existed during 1917 between the various parts of the Army organization and the War Industries Board, as contrasted with the efficient mechanism finally devised under the Director of Purchase, Storage and Traffic, serves powerfully to establish the conviction that there should be no return to the former bureau system of Army supply.

Clearance.—During the early months of the war, no clear cut distinction between clearance, priorities, and requirements was devel-

oped. The General Munitions Board itself dealt with all three and sometimes "requirements" were spoken of as presented for "clearance," questions of "priority" also being decided by the board in connection with the particular transaction concerned. Later, however, much sharper distinctions emerged. Special committees of the General Munitions Board on priorities and clearances forshadowed the later War Industries Board committees on these matters. In general, the distinctions which finally developed were the following:

"Clearance" came to mean approval of a "schedule of immediate or prospective purchases." The "requirements" of the army or bureau for a given article or material came to mean its calculated needs stated in the form of a monthly schedule projected for a year or more into the future. The word "priority," which was originally applied at times to preference given as between two conflicting requests for immediate purchase, came finally to be disassociated from the idea of a particular contemplated purchase transaction, and was connected rather with preferential treatment to be given to a Government contractor in the matter of fuel, raw materials, labor, or transportation facilities to which he became entitled as against other contractors whose work was considered less vital to the Army program. As finally administered by the important Priorities Board it came also to cover the determination of preferences in the broadest aspects of the Government's conduct of the war.

In the present discussion of clearances the word is used as defined in the preceding paragraph. In the early months of the war conflicts speedily developed between the departments and bureaus of the Government in regard to purchases. In order to have these conflicts settled or prevented, the contemplated purchases were referred to the General Munitions Board for clearance and clearance was granted only after the conflicts had been adjusted. It was not long before shortages became so well known that a shortage list or clearance list was drawn up and it was arranged that the bureaus and departments should not place orders for items on this "clearance list" without first presenting the matter to the General Munitions Board.

In such negotiations the five original supply bureaus of the Army appeared independently before the General Munitions Board sometimes even asking that body to settle conflicts as between two supply bureaus of the Army. As the Army program developed in magnitude, purchases calling for clearance greatly increased in number, and it was finally a cause of great dissatisfaction in the General Munitions Board and the War Industries Board which succeeded it, that the Army did not have any concerted presentation of such matters.

One of the results which the Purchase, Storage and Traffic Division undertook to bring about was the unifying, for the Army, of requests for clearance. Accordingly, on May 25, 1918, Supply Circular No. 15 was issued, requiring the supply bureaus to submit all immediate requirements or prospective purchases of commodities included on the clearance list of the War Industries Board to the Supply Program Section, Purchase and Supply Branch, for presentation to the War Industries Board for clearance. It was required that such action be taken before negotiations of any kind were initiated with contractors. This latter requirement was in-

tended to make it possible to utilize the facilities of the War Industries Board to the fullest degree in the matter of obtaining advice or instructions as to the most suitable place for making purchases.

An Army Clearance Committee was organized, composed of the liaison officers or other representatives from the various supply bureaus. This committee met under the direction of a clearance chairman of the Purchase and Supply Branch. The procedure to be followed was still further elaborated in Supply Circular No. 48, issued July 17, 1918. This circular really gave formal expression to the practice of clearance as it had been developed during the intervening months. It reiterated the requirement that "schedule of immediate or prospective purchase" involving articles or materials enumerated on the clearance list of the War Industries Board should be submitted through the Purchase and Supply Branch for clearance and in no case direct to the War Industries Board. It added, however, to such prospective purchases those involving orders within the "congested" district as it had been defined by the Fuel Administration and also orders involving the creation of new facilities or the conversion of existing facilities.

Daily meetings of the Army Clearance Committee were held, at which conflicts or difficulties as between the Army bureaus were settled. After going through these processes the requests for clearance were transmitted by the Army clearance chairman to the Clearance Committee of the War Industries Board.

Clearance by the War Industries Board took one of the following forms: (a) Unconditional clearance; (b) clearance subject to restriction as to congested area; (c) clearance subject to restriction as to placing orders in centers short of power; (d) clearance subject to restriction as to congested plants; (e) clearance subject to restriction as to new plant facilities, or with suggestion as to existing plant capacity available for this class of work; (f) clearance disapproved; (g) clearance with definite allocation of the order to a producing firm.

The requests for clearance were submitted by the bureaus originally on various forms but subsequent to Supply Circular No. 48 on standard forms. One of these copies was held as a file copy by the Army Clearance Section—the other three, including the original, were transmitted to the War Industries Board. There the matter was usually sent through the clearance secretary of the War Industries Board Clearance Committee to the Commodity Section of the War Industries Board interested in the article in question. After action had been taken on the matter one copy of the clearance was retained by the Commodity Section, one by the clearance secretary, and the original was returned to the Army Clearance Section. This section noted upon its own file copy the action taken by the War Industries Board and forwarded to the supply bureau its original request, carrying a notation of the clearance action taken. The War Industries Board was allowed 48 hours in which to act upon requests for clearance. If action was not taken within this time the supply bureau was then at liberty to proceed with its negotiations for purchase.

The daily clearance meetings in the War Industries Board were abolished after the middle of July, because experience showed it to

be unnecessary for representatives of the different departments of the Government to hold a formal meeting each day for clearance duties. The reason for this was that the commodity sections of the War Industries Board had developed such efficiency and familiarity with their respective commodities, as well as with the needs of the Government departments and bureaus, that clearance came to be possible as a rapid routine action by these commodity sections, upon each of which it will be remembered the Army had its representative.

In carrying out this procedure, the War Industries Board notified all parties interested each day of the clearance requests received the day before. This gave an opportunity within the 48 hours for protest where serious conflict existed. As a matter of fact, protests became negligible in number because of the familiarity on the part of the commodity sections with the questions at issue.

On August 29, 1918, Supply Circular No. 82 restated the clearance process, making mention of the localities which were short of power and giving the clearance list of the War Industries Board as it stood at that time. By familiarity with the War Industry Board's practice, the Army clearance officer found that a great many requests for clearance were unnecessary, and with the permission of the chairman of the War Industries Board undertook to discriminate between the requests which should be submitted and those which need not be. About 50 per cent of the requests submitted by the bureaus were actually cleared by the Army clearance office and were returned to the bureaus on the same day. In such cases, copies were sent to the War Industries Board with the action noted. During the five months in which this system was in operation there was no case in which the War Industries Board objected to the action so taken. The whole mechanism of clearance was working so efficiently during the last months of the war that nearly 26,000 requests (nearly 95 per cent) were actually cleared within the 48 hours allowed.

Certain requests for purchase were "allocated" instead of being "cleared." This meant simply that the proper authorities in the War Industries Board determined the particular manufacturer concerned, who should handle the order. Requests for allocation of pig iron and steel were not handled through the Army Clearance Committee but through an office in charge of the chairman of the Army Committee on Iron and Steel.

Shortly after the signing of the armistice, by Supply Circular No. 123, December 2, 1918, clearance (including allocation) was abolished.

Purchase and rental of real estate.—To the middle of June, 1918, no corps or bureau had organized a real estate department except the Signal Corps and the Director of Storage, of the Storage and Traffic Service. On June 12, 1918, the real estate unit which became a part of the Purchase Section of the Purchase and Supply Branch was formed. This Real Estate Unit was organized in pursuance of a memorandum issued by the Assistant Secretary of War, dated May 20, 1918, reading as follows:

The office of the Director of Purchase, Storage and Traffic shall have sole charge of carrying out the purchase, lease, rental, condemnation, or requisitioning of real estate and of buildings for the use of the War Department, recommended by the Operations Division, General Staff, and all such questions shall be referred to it for necessary action after its approval.

As the Division of Operations and the Division of Purchase, Storage and Traffic were jointly interested in real estate matters it was necessary for them to agree upon a procedure for the routing of all papers. Such an arrangement was made and set forth in Supply Circular No. 32, June 22, 1918, and amplified shortly thereafter in Supply Circular No. 33, July 2, 1918. Under the terms of these circulars all contemplated purchases or rentals of real estate were to be submitted for the approval of higher authority through the action of the Real Estate Unit. As all of the business of this unit was performed for the supply bureaus this office was organized on the bureau basis. The following statement descriptive of the work of the Real Estate Unit is taken from a report of that office:

The functions of the Real Estate Unit in connection with the acquisition of real estate is as follows: In case a particular piece of property is desired by a bureau a request is addressed to the Purchase, Storage and Traffic Division asking that the property be obtained, stating the amount asked, either for rental or purchase, giving the reason for which the property is needed, and that the funds of such bureau or corps are available for the purpose. The proposition is then investigated by the unit, either by sending a representative to view and appraise the property, or by communicating with local appraisers known to the department, or requesting a local committee of appraisers representing the Real Estate Board of that particular locality. A recommendation based on the result of such investigation is then made to the Director of Operations and on receipt of his approval together with that of the Assistant Secretary of War when the proposition in the opinion of the director necessitates that approval, and this unit then proceeds in case of lease, to negotiate and prepare for the signature of the contracting officer of the bureau and the lessor, and in case of sale, obtain abstracts, forward them to the Judge Advocate General's Office for examination. After return from the Judge Advocate General's Office, the defects if any in the title are pointed out and steps taken to have them cured, and when titles are in approved shape, a recommendation is then made to the corps or bureau for which the purchase is being made that the funds be disbursed. In case a request is made for property on which no estimate of the rental or value has been made by the corps making the request, an investigation is made as to a fair rental or purchase value and a memorandum to that effect is made the corps, which in turn make the request as stated above. In case the section is unable to obtain the property at a fair value, or the owners are unwilling to negotiate, or there is a defect in the title, condemnation or requisition proceedings, as the case may be, are instituted by this section.

When the property can not be obtained at a fair market figure, or the title of the property is so involved that a merchantable title can not be obtained, or owing to the fact that the multiplicity of owners would entail great delay in obtaining possession, requisition, or condemnation proceedings are instituted, depending on the use to which the property is to be put. A request is made the advisory and consulting department of this section to prepare the proceedings. Under both proceedings immediate possession is given the Government.

The power to requisition which has been invoked, is granted in an act of August 10, 1917 (Public, No. 41, 65th Cong.), and an act of November 4, 1918 (Public, No. 233, 65th Cong.). The former applies to property needed for storage and the latter grants power to requisition for hospital use. * * *

Condemnation proceedings are initiated under an act of July 2, 1917 (Public, No. 26, 65th Cong.), as amended by an act of April 11, 1918 (Public No. 127, 65th Cong.). Other emergency condemnation laws have been passed but those cited are the most frequently invoked. Actual condemnation proceedings is in charge of the Department of Justice. * * *

In both requisition and condemnation proceedings possession is taken upon issuance of the requisition or petition.

With the exception of the Signal Corps, the Division of Military Aeronautics and the Bureau of Aircraft Production, there were no complete records of any corps or bureau of the military establishment and the aim of this section has been to prepare and obtain a record of the real estate activities of every corps or bureau and properly classify same. * * * This section has prepared a

statement showing the amounts and locations of the various leases arranged geographically. This is probably the most complete list of leases in existence and undoubtedly contains a large percentage, but there are undoubtedly many renewals of leases made prior to July 1, 1918, copies of which have never been sent to this section. In fact, it is doubtful in many cases whether renewals have been made notwithstanding the fact that the Government is in possession of the property. In addition to that there are many cases where the Government has taken possession of land or buildings without an agreement for either loss or purchase.

Already there has been a vast number of claims involving damages to real estate presented to this division and as far as possible these have been adjusted. However, there will be an ever increasing number of such claims. * * *

It will be seen from the foregoing account that there was a very real need for a unit which should handle real estate matters for all supply bureaus in accordance with a common plan and with the efficiency which is possible only through an office manned by qualified real estate experts. A great deal of trouble for all parties concerned as well as much expense to the Government was avoided through the creation and operation of this real estate unit.

Price fixing.—Speaking generally, it may be said that the War Department did not fix prices for the things which it bought. Procurement officers in the various supply bureaus made contracts in the ordinary way, the price being simply one of the terms of the contract.

It has already been explained that the War Industries Board, through its commodity sections and in other ways, furnished the means by which the War Department in its procurement operations could deal with an industry as a whole and in the most advantageous way. Through the War Industries Board also the purchasing of the Government, which originally had been carried on through the uncoordinated activity of the various departments and bureaus was reduced to a system under which the Government presented a united front in its purchasing activity in any given line, at least when difficulties of any kind were encountered. Price fixing was also a function of the War Industries Board, and one in which the War Department was very vitally interested, for if prices were too low production would be curtailed and if they were too high the Government would be subjected to unnecessary expense.

The War Industries Board had a Price Fixing Committee which included, in addition to its chairman, representatives of the Federal Trade Commission, Tariff Commission, Fuel Administration, the Army, and the Navy. There was also on the committee a representative of the agricultural interests of the country. This committee, while a part of the War Industries Board organization, reported to and was responsible to the President direct. As a rule, prices were fixed only where a considerable degree of scarcity existed. The interests of the Army were taken care of by its representative, who was attached to the Purchase Branch and also served as a member of the Board of Appraisers referred to above. In the handling of his work, the representative of the Army constantly had recourse to the Army Commodity Committees as the repositories of much information in regard to the particular commodities and industries concerned, and also as being in touch with the needs of the various Army bureaus in the matter of price connected with the purchases which they had to make.

It will be evident from the foregoing that in the matter of price-fixing as in so many other particulars the bureau system of procurement proved to be an imperfect mechanism under the pressure of world war. The situation called for a single agency to represent all the procurement activities of the Army.

Priorities.—In time of peace priority is purchased. An order for goods is generally accompanied by a stipulation as to when the goods are to be delivered. A sudden need can be met by the placing of a rush order. The early delivery so obtained is paid for in an increased price, and this increased price furnishes the motive which hastens the processes of production. Of course the added element of cost involved is avoided as far as possible by foresight by the careful calculation of future needs, and by the provision of production facilities designed as nearly as may be to meet the best calculations possible of those needs. The purchase of priority is thus reduced to a minimum, but nevertheless it is a familiar aspect of industrial activity.

The breaking out of war created enormous and sudden new demands for the numberless things involved in the great program of supply which the war necessitated. As speed was the essence of the emergency, a condition immediately arose in which priority was insistently demanded on all sides. And at the outset, in accordance with the nature of the situation, priority was paid for by the offer of increased prices—in some cases prices extravagant in the extreme.

In this early competition for priority the departments and bureaus of the Government engaged in conflict with each other, with results which immediately cried for remedy, but for which remedial mechanism was not easy to devise. At an early date the Council of National Defense, it will be recalled, had created the General Munitions Board and various committees, a part of whose work was the settlement of conflicts in the matter of purchase requirements as between the various purchasing agencies of the Government. Out of the activities of the General Munitions Board emerged the Clearance Committee and the Priorities Committee, which evolved later into the similar committees of the War Industries Board.

These committees, as already explained, were composed of representatives of the various departments and bureaus of the Government, and of the major industries of the country. Each department and bureau representative by the nature of things was anxious to promote the particular part of the war program with which his bureau was charged. It might be supposed that each department and bureau would have recognized the importance of the program of the others, and would have refrained from insistence upon its own. Such was very far from being the situation in the early months of the war. Each procuring agency was responsible, not for the synchronized movement of the supply program as a whole, but for its own individual task. Before the development of a tested and dependable mechanism of coordination, the presentation of the conflicting supply requirements frequently degenerated into a contest of wits and a struggle for advantage instead of a cooperative effort for the best composite result. In such a game if each department and bureau plays a lone hand, some are bound to be more successful than others and the even balance of the supply program as a whole, so essential to

success, is not accomplished. Cooperation can be obtained only when it is thoroughly understood that individual interests must be subordinated for the good of the whole and when a proper mechanism is devised for making such a purpose effective.

In the early competition for materials, supplies, facilities, fuel, labor, power and transportation, the Army did not enter with united forces. Each of its supply bureaus had its own representatives and urged its own claims. Even as between parts of the same bureau conflict of interest frequently arose.

Priority was uppermost in the minds of all. With supplies known to be limited, the struggle to obtain them was general, and early deliveries were much in demand. Out of the conflict there gradually emerged a system, and this system was improved and perfected until it became the central medium for coordinating the Army program as a whole.

The plan evolved included a graded system of priority certificates for work of different degrees of importance, a classification of industries in accordance with their relative importance in the conduct of the war, and even a rating of individual plants as higher or lower in importance than the average of the industry in which they belong. Finally automatic features were introduced into the system, under which the industry of the country very largely regulated itself under general principles and classifications which the several plants could apply in the internal scheduling of their own activities, and in their relationships with each other.

The general aspects of this system were within the jurisdiction of the powerful and important Priorities Board. Its application in the field which lay within the jurisdiction of the War Industries Board was the function of the Priorities Committee. The Priorities Board consisted, in addition to the priorities commissioner and the chairman of the War Industries Board, of either members of or important officials in the Railroad Administration, Navy, Army, Department of Labor, Allied Purchasing Commission, Fuel Administration, Food Administration, Shipping Board and War Trade Board. Obviously a board of this composition was capable of determining the broadest aspects of priority with which the war program as a whole was involved. With the broad principles so determined the various departments severally applied them, each within its own jurisdiction.

One of the tasks of the Purchase, Storage and Traffic Division was the development of a priority system for the Army. This included both the settling of priority questions as between the various supply bureaus of the War Department and the single representation of the War Department in priority matters in the forum of the War Industries Board. The representative of the division was detailed for duty in the Purchase and Supply Branch.

For the purpose of outlining and explaining the whole matter of the handling of priority requests, Supply Circular No. 50, dated July 17, 1918, was issued to the bureaus. This provided for the creation of a priorities committee within each supply bureau. Briefly, conflicts within a bureau were to be settled by the bureau committee; the requests were then to be transmitted to the Army priorities officer, and after conflicts between bureaus had been resolved, the requests were to be put through the regular procedure of the Priorities Committee of the War Industries Board.

The system thus set up worked with great efficiency. As priorities work went forward, both general principles and details of application were developed to an increasing degree of perfection. At the end of hostilities practically all the industries of the country were operating under priority schedules which kept their entire activities in pace with the progress of the Army program as a whole.

Replacements and allied relations.—When the Purchase and Supply Branch was created it was found that there was great need for systematizing certain of the supply relations of United States with England and France. From both of these countries purchases of war supplies were being made, and in many of the agreements the obligation was incurred of "replacing" the amounts of raw material involved in the supplies bought. Sometimes the replacement was in kind; in other cases different arrangements were made.

Since the negotiations were conducted by the various supply bureaus it had come about that there was not in existence anywhere any complete record of the nature and extent of these obligations. A Replacement Section was therefore established to supervise the various obligations involved in meeting the replacement obligations.

The carrying out of the task brought into the Replacement Section a considerable volume of business relating to purchase from and sales to the allied nations which were not necessarily of a replacement character. At the time of the general reorganization this was recognized in Supply Circular No. 86, September 5, 1919, in which the section was renamed the Allied Relations Section, and its duties stated as follows:

Allied Relations Section.—To maintain relations and conduct negotiations with representatives of allied Governments in matters pertaining to supplies, and to supervise and direct the compilations and maintenance of records and accounts pertaining thereto.

The supervision of supply relations with the Allies was largely a task for a single officer. Conditions at the outset were found to be chaotic. These were speedily reduced to order, negotiations with the Allies put upon a thoroughly business basis, and systematic records compiled and maintained. Incident to these tasks general cable correspondence in regard to purchase and supply, and also special cable correspondence with the Assistant Secretary representing the War Department in the Interallied Munitions Council in Paris, were classified and indexed.

The work of the section exemplifies from another angle the desirability of a single service of supply rather than the bureau system as it existed at the beginning of the war. Within such a service it would be a simple matter to provide the mechanism for unified treatment of supply transactions with allied countries. When the matter is scattered over a number of bureaus the task is much more difficult. In fact to the very end it was difficult to get the bureaus to recognize and utilize the channel which had been created for the handling of negotiations of this character.

The consolidation of procurement.—The consolidation of procurement has already been referred to as a process which paved the way for the reorganization of the supply system in the latter part of the summer of 1918. Under the bureau system of supply as it had grown up there were many duplications in the procurement tasks of the

several bureaus. In many cases two bureaus or several bureaus were buying many articles so nearly alike that they could easily be standard. Disregard of such possibilities resulted in disorganization of the market, high prices, undue expense from multiplicity of types, unnecessary personnel, unnecessary accounting complications, and dual representation of requirements before the War Industries Board.

It was determined that the articles in question should be taken up one by one and a consolidation of procurement arranged. The general principle followed was that procurement should be centered in the bureau having the greatest interest.

Accordingly Supply Circular No. 2 was issued on May 8, 1918, outlining the general scheme of procurement consolidation. The following provisions were included:

Whenever it shall be decided to consolidate, under one bureau the procurement of any article or material now being procured by more than one supply bureau of the War Department, the following general instructions shall govern in such consolidations:

(a) Each supply bureau will continue to issue to the service the same articles as heretofore, these articles being delivered to it by the procuring bureau for such issue.

(b) Each issuing bureau will continue to be responsible for the determination of requirements for such articles.

(c) Each issuing bureau will continue to be responsible for the designs and specifications for such articles.

(d) Where the issuing is not the procuring bureau, the former shall make procurement requisition on the latter for its requirement, at the same time making transfer to the procurement bureau of the estimated amount of funds required for the purpose.

(e) In accordance with such procurement requisition, the procuring bureau will be solely responsible for making purchases, following production, conducting inspection, and making acceptance of and payment for the articles placed in its charge.

Upon the issuance of circulars designating procurement bureaus for given articles each issuing bureau shall submit to the designated procuring bureau a list of personnel, if any, engaged in the purchases, production, and inspection of such articles in order that proper recommendations may be made by the procuring bureau for the necessary transfers of personnel to handle the consolidated work.

This circular was followed by a long series of circulars, taking up articles one by one or in groups and providing for the consolidation of their procurement.

There are two outstanding facts in regard to the consolidation of procurement which call for comment. The first is that many troublesome issues arose in connection with interbureau procurement requisitions. The difficulties were not all clearly envisioned in advance, and perhaps could not have been. The result, however, was that there were many complaints, and the impression was made that action was taken too hurriedly, without adequate provision of the necessary mechanism for making consolidation effective and smooth. The interbureau procurement requisition became a point of complaint around which could center the widespread opposition to the general process of supervision and centralization which was going on. A great deal was made of the contention that the procuring bureau did not properly look after the procurement requests of other bureaus.

The second fact is that when the process of consolidation by articles was complete the Quartermaster Corps was procuring by far the larger number of articles in the Army program. As a very natural

result this corps became the nucleus around which was gathered the great bulk of the procurement of nontechnical articles by the general reorganization of the latter part of the summer.

The consolidation of procurement was an activity of the Purchase Section of the Purchase and Supply Branch.

Production.—The three phases of procurement which had been formulated were requirements, purchase and production. The particular task of the Production Section was to compare the progress of production with requirements, and to devise the necessary measures for expediting production where it seriously fell behind.

There were already elaborately organized production divisions in the supply bureaus charged with exactly the same responsibilities. It may be held that the primary responsibility for production lies with the procuring officers. Contracts should be placed where they can and will be fulfilled on schedule time. In such a view the procurement divisions had themselves a supervising function. The Production Section of the Purchase and Supply Branch therefore had the task of supervising other supervising bodies. There was, however, plenty of work to be done under the head of production, and the problem of accomplishing production had no end.

The organization of the Production Section was not hastened, as it was felt that its task followed in chronological order after the statement of requirements and after the purchase program was well in hand.

One of the undertakings of the Production Section was a study of the organization and operations of the production agencies of the bureaus. The studies were embodied in a set of reports, but they did not lead to the adoption of a definite or comprehensive program of production supervision. In lieu of such a program matters of production were handled as individual problems. A comprehensive program for the expediting of production was still in progress when the armistice was signed.

Finance.—At the outbreak of the war each of the five supply bureaus had its own disbursing officers and its own system of fiscal accounts. These systems were entirely independent of one another and received almost no outside supervision aside from occasional inspection of disbursing officers' accounts by representatives of the Inspector General's Department and review of appropriation estimates by the Chief of Staff and the Secretary of War.

In addition to the financial activities of the supply bureaus accounts were maintained and funds disbursed by the General Staff Corps, Militia Bureau, Inspector General's Department, and the office of the Secretary of War, for maintenance and miscellaneous purposes.

In other words, there were 10 different agencies in the War Department which were handling funds. There was also a Division of Requisitions and Accounts under the Assistant and Chief Clerk in the office of the Secretary of War which served as the connecting link between the Treasury Department, the War Department and the finance sections of the various bureaus. All appropriations, all requisitions for funds on the Treasury and all notifications of the final approval of accounts by the Treasury passed through this division, which maintained a set of ledgers showing for each appropriation the amounts allotted to the various bureaus, the amounts with-

drawn from the Treasury by disbursing officers and the amounts actually disbursed as approved by the Treasury. It also passed on printing and binding requisitions and transmitted them to the Public Printer and made allotments to the various bureaus under the War Department appropriations for printing and binding. It did not, however, exercise any control over the expenditure of funds placed to the credit of the bureaus or over the accounting methods used by them, nor did it attempt in any way to coordinate their activities.

Army Regulations, paragraph 740, provide that:

The supply, payment, and recruitment, of the Army and the direction of the expenditures of appropriations for its support are by law intrusted to the Secretary of War. He exercises control through the Chief of Staff and the bureaus of the War Department. He determines where and how particular supplies shall be purchased, delivered, inspected, stored and distributed.

As a matter of fact, control of appropriations by the Secretary of War was exercised almost wholly through delegated authority. At the beginning of each fiscal year the Secretary, as required by law, apportioned each appropriation so as to prevent undue expenditures in the first part of the year. After this apportionment had been made and the appropriations placed to the credit of the various bureaus, practically complete control over their expenditure was exercised by the bureau chiefs. Matters of special importance or upon which the Secretary had expressed a desire to pass judgment personally were returned to him for action, but as a general rule final decisions as to the purposes for which an appropriation was to be used rested with the chief of the bureau, in accordance, of course, with the terms of the appropriation. Except on special request, the only financial report submitted regularly to the Secretary of War was the annual report from each bureau stating the amounts expended under each appropriation and, in a general way, the purposes for which they were used. There was, therefore, little or no supervision or coordination of the financial activities of the bureaus.

The great bulk of the War Department funds was naturally handled by the five supply bureaus, each of which had its own finance section. The organization and functions of these sections varied greatly. Terminology employed, forms used, methods of procedure followed, and the character of the records maintained differed widely. There was no uniformity of classification as to the exact purposes for which funds were spent. As a result it was impossible without going through a mass of individual vouchers to determine the total expenditures of the War Department for special items, or, in some cases, the itemized expenditures of a single bureau. Proper accountability; the preparation of appropriation estimates; the recording, filing and execution of contracts; the settlement of claims, etc., were handled by the finance sections of some of the bureaus but not by others. This lack of uniformity undoubtedly came about as a result of years of independent development. So long as the bureaus acted in financial matters as a set of loosely related units, this was not, perhaps, a particularly serious situation. As soon, however, as an attempt was made to unify the supply system of the Army and to get them to doing business together, it formed an almost insuperable obstacle to effective coordination.

Comparatively few important changes occurred in the financial system of the War Department during the first nine months of the war. One disbursing and accounting agency was added to those already in existence through the creation of a finance section in the office of the Provost Marshal General to care for the appropriations made for that office. The finance sections in the supply bureaus expanded greatly in size as a result of the material increase in their activities. No attempt was made to supervise the financial activities of the bureaus or to coordinate their methods and records, largely because no steps had been taken toward the consolidation of procurement.

The Director of Purchase, whose office was created January 11, 1918 (later Director of Purchases and Supplies), established a unit known as the Fiscal Section "for supervising the preparation of financial estimates and expenditures of appropriations." Some attention was given by this section to the matter of estimates for appropriations, but nothing in the way of standardization appears to have been accomplished.

The report of the Committee of Three already referred to included among its recommendations provision that the Office of the Director of Purchases and Supplies should have authority:

To provide an accounting control section which shall standardize accounting and fiscal methods and reports of the several bureaus, analyze, and consolidate them, showing at all times the state of the finances of each department and of the War Department as a whole * * *.

In order to carry out these functions, the committee recommended the creation of a finance section as one of the main divisions in the Office of the Director of Purchases and Supplies. By the time the committee's report was rendered the Purchase, Storage and Traffic Division had been formed, so that when the Finance Section was finally organized it became a part of the Purchase and Supply Branch of that division. No definite order creating the Finance Section was made but it was organized on May 8, 1918, and continued substantially unchanged until the creation of the Accounts Department on August 27, 1918.

During the intervening months much in the way of preliminary surveying of the fiscal system of the Army was accomplished and the ground was laid for the coordination of finance which came later. A great deal of this work took the form of bringing together in an informal way the chiefs of the finance sections of the various supply bureaus for the purpose of familiarizing them with each others' methods and problems with a view to securing their assent to the processes of standardization and coordination.

Supply Circular No. 12 of June 8, 1918, promulgated instructions governing uniform procedure in the consolidation of procurement. It included provisions outlining the method to be followed in the transfer of funds under interbureau procurement requisitions.

This order was closely followed by Supply Circular No. 19 of June 10, 1918, in regard to the standardization of accounting methods. This circular charged the Finance Section of the Purchase and Supply Branch with the duty of standardizing and coordinating all fiscal accounting methods in the several bureaus, and provided that no change in existing accounting methods should be made until approved by the Finance Section. Work upon the system of uniform accounts was begun immediately, but was not completed until a later period.

During the latter part of August, 1918, the work of supervising the classification and compilation of all estimates and appropriations, including supplemental and deficiency estimates to be submitted by the War Department during the fiscal year 1919, was taken over by the Finance Section by order of the Secretary of War, which relieved the Assistant and Chief Clerk of this duty.

The tasks which devolved upon the Finance Section were among the most difficult in the whole problem of coordination and furnish the strongest illustrations of the vital necessity for the establishment of that factor in the organization of the War Department if it is to function as an efficient machine. The work of the Finance Section of the Purchase and Supply Branch can not be measured in terms of concrete results, for its accomplishments consisted chiefly in preparing the foundations, in the face of the opposition of a decentralized and disorganized system firmly entrenched by years of independent growth, for the building later of a centralized department of Army finance. This department will be treated separately in a later part of the report.

THE EMBARKATION SERVICE.

In the foregoing pages the supervision of supply activities in all its ramifications has been referred to. In addition to the fundamental problem of getting supplies actually into existence there were other services just as vital in securing the proper handling of those supplies and carrying them promptly and safely to their ultimate destinations, whether to the firing line in France or the training fields of the United States. The histories of these services can be given in distinctive and unified accounts, as the subsidiary services were affected much less by the reorganization than the fundamental service of supply. The first of these in point of establishment and in many ways in point of importance was the Embarkation Service, which directed the flow of supplies overseas.

Transportation control prior to the war.—Prior to the outbreak of the war and during the first three months of hostilities, the movement of troops and supplies was handled through the land and water branches of the Transportation Division of the Quartermaster Corps and through transportation officers of the various corps. The Quartermaster Corps was highly decentralized and transacted local business at any point through the nearest depot quartermaster. There were depot quartermasters at each of the principal ports. There was also at each important port a general superintendent of Army Transport Service charged with handling the operations of transports and responsible to the local depot quartermaster.

The movement of supplies and troops was carried out as follows:

The commander of a detachment of troops to be transported applied to the nearest depot quartermaster for transportation in accordance with his orders, and the depot quartermaster, acting in this capacity, under the guidance and instruction of the Transportation Branch, procured the necessary transportation. The officers of the division in charge of land and water transportation cooperated closely and made whatever arrangements were necessary for the movement of troops through to their destination, whether this involved only land transportation or water transportation, or both.

There had been formed by the American Railway Association a board called the Railway War Board, for the purpose of coordinating the railroads in so far as they were called upon to move Government troops and property. This board had a general agent at each camp and embarkation depot to represent the railroads, and the depot quartermaster in making arrangements for the transportation of troops dealt directly with this general agent of the railway association.

The officer responsible for the movement of freight in any bureau of the Army, if the movement was to be by land only, made his contract direct with the carrier and delivered his goods direct to it. At the point of destination, the recipient of the goods notified the local depot quartermaster, through whom payment for the shipment was made. If the goods were to be transported by water, or by land and water, the arrangements for transportation by water were made by the local general superintendent, Army Transport Service, where the water shipment started, under guidance and instruction from the Transportation Division.

The duties of the Water Transportation Branch at the outbreak of the war were to supervise the entire operation of the Army Transport Service. Many of these duties were performed in the first instance by the superintendent of Army Transport Service; others, such as allocating vessels to different services, drawing plans and estimates for construction and repairs, etc., were performed by the Water Transport Branch itself. The duties of the branch may be outlined as follows: (a) Operations—it operated seven Army transports to and from the Philippines, Alaska, Panama, and Cuba, and the harbor facilities, etc., therefor were managed by the superintendents; (b) construction; (c) personnel; (d) finance.

The work of the Land Transportation Branch was to supervise land movements of troops and quartermaster supplies. Many of the arrangements for such movements were made by local depot quartermaster officers, except where the amount of transportation required was large, in which case it was taken up by the Land Transportation Branch direct.

Organization of ports of embarkation.—It was soon foreseen that peace-time machinery and methods would be inadequate to handle the problems of transportation which would develop. The first necessity appeared to be for the establishment of administrative organizations at the ports along the seaboard through which the greater part of the stores of supplies must pass on their way to Europe.

Thus, on June 20, 1917, the Quartermaster General submitted a report recommending the organization of "New York and Newport News, and such other ports as may be necessary, as ports of embarkation." The port of New York was recommended for the transportation of troops and supplies and Newport News was suggested for use in the shipping of animals, forage, and heavy ordnance. It was also recommended that there be established an embarkation camp at New York sufficient in size to take care of one division, and that there be formed a depot for the accommodation of approximately 10,000 animals, with camps and cantonments for the supply companies of a division.

On July 2, 1917, the assistant to the Chief of Staff submitted a memorandum emphasizing the lack of coordination then existing between the agencies performing embarkation functions, urging the need of the immediate organization of the ports of embarkation and recommending the appointment of a "Supervisor of Military Supplies."

All questions relating to place of shipment, priority and order of shipment, relative amounts, etc., to be determined then by the Chief of Staff after all data upon demand and supply are placed before him by the Central Coordinating Office, and requiring them (the chiefs of supply bureaus) to be guided as far as possible by the supervisor's advices as to the time of forwarding the supplies and their quantity, and absolutely as to the port of collection in anticipation of overseas transportation.

On July 5, 1917, the Chief of the War College Division submitted a report to the Chief of Staff embodying the recommendations of the Quartermaster General and the assistant to the Chief of Staff, except that in place of the Supervisor of Supplies, he recommended the appointment of a Chief of Embarkation. It is to be noted that at the time the first of these memoranda was submitted, on June 20, instructions had already been issued to the commanding general Department of the East to organize New York as a port of embarkation.

The first orders for the formation of a port of embarkation were under date of June 6, 1917, from the Acting Chief of Staff to The Adjutant General, containing the following paragraph:

The Secretary of War directs that the commanding general Eastern Department be instructed by wire to exercise the functions of commander of the port of embarkation, New York, until some line officer for such duty has been designated by the War Department; that he be directed to recommend a site in the vicinity of New York appropriate for location of a camp of concentration, in case such camp becomes necessary.

On July 3, the first commander of the port of New York was designated.

Newport News, Va., was organized by the commander of that port who was designated by a confidential order on July 7, 1917.

The first troops sent abroad were hospital units on commercial liners, but these were transported under the control of the Water Transportation Branch of the Quartermaster Corps, acting through the general superintendent of Army Transport Service, New York. The arrangements for the first convoy were made after the order directing the organization of the port, but the influence of this order had not yet been felt.

The duties of a commander of a port had been formulated long in advance in paragraph 257 of the Field Service Regulations and were as follows:

- (a) To arrange camps for the troops at or near the port of embarkation.
- (b) To accumulate supplies for the maintenance of the expeditionary force while at the port of embarkation and until its arrival at the port of debarkation.
- (c) To accumulate and ship the necessary supplies for the maintenance of the troops at the oversea base pending the organization of the supply service in the theater of operations.
- (d) To make all detailed arrangements for the prompt detraining of troops and material and for their subsequent embarkation.

(e) To see that the ships furnished him by the Quartermaster Corps are properly fitted out for use as transports.

(f) To operate and maintain the military shipping and traffic between his port and the oversea base through a superintendent of transport service, who is a member of his staff.

(g) To command all administrative groups assigned to the port of embarkation and to be directly responsible to the War Department for the efficient and economical direction of their operations.

The commander of the port of embarkation, his staff, and personnel are not subject to the orders of the commander of the troops at the concentration camp, nor the latter commander to the orders of the former. The commander of the port of embarkation prepares the schedules for the embarkation of troops, material and supplies on transports, and has charge of such embarkation. The commander of the camp issues the orders necessary to carry out the schedules and details a staff officer to assist the commander of the port of embarkation during the loading. Under all conditions these schedules will be made only after consultation with the superior commander of the troops to be embarked. When a landing or disembarkation in the face of opposition is anticipated, the distribution and plan of embarkation will be made to suit the tactical requirements of the situation, and in case of a difference of opinion, the final decision will rest with the commander of troops. When no opposition to landing is expected, the final decision will rest with the commander of the port of embarkation. Cordial cooperation between these commanders is essential to the efficient performance of their respective duties.

By virtue of paragraph (g) above, the superintendent of Army transports at the port was placed under the jurisdiction of the commanding general of the port.

The port of embarkation at New York was the principal port for the shipment of troops during the war (88 per cent of the troops passed through this port). It included the terminals at Newark, Hoboken, and Brooklyn, and to facilitate shipment of troops from the port there were designated three embarkation cantonments, Camp Merritt with a capacity of 38,000; Camp Mills, 40,000; and part of Camp Upton, 18,000.

The port of embarkation at Newport News, including Norfolk, besides being the port for shipment of much of the freight and a small proportion of the troops, was the point of shipment for animals. This port included Camp Stewart with 25,000 troops, Camp Hill 18,000 troops, a quartermaster terminal at Sewell Point, an ordnance depot at Pig Point, a Signal Corps station at Morrison, Va., and extensive Engineer terminals and general warehouses.

Overseas expeditionary depots were established at Boston, Philadelphia and Baltimore. From Savannah, Jacksonville, Mobile, Gulfport, New Orleans, Galveston, and Lake ports shipments were made from time to time.

Prior to the establishment of the Embarkation Service there were shipped to France some 25,000 troops, including Gen. Pershing and his staff, base hospital units, railway engineer regiments, Field Artillery regiments and aviation detachments.

Formation of Embarkation Service.—The Embarkation Service was formed by General Orders, No. 102, War Department, August 4, 1917, which gave its purpose as follows:

The function of this section is to coordinate all shipments of munitions and supplies of every kind and all troop movements whose ultimate destination is Europe, and to advise and assist the Chief of Staff in reference thereto. It will have direct supervision, under the Chief of Staff, of all movements of supplies from points of origin to ports of embarkation, will supervise the operations of the latter, and will control the employment of all Army transports engaged in the trans-Atlantic service and such commercial shipping as may be used to supplement that service. It will arrange with the Navy for convoy service.

It is made the duty of all chiefs of supply bureaus to keep the Chief of the Embarkation Service informed fully of the condition of supplies in their several bureaus, and to this end they will correspond directly with that officer. Direct correspondence between the Chief of the Embarkation Service and the commanding officers of ports of embarkation is authorized. Copies of all requisitions, requests, and information of every character received from the commanding general of our forces in Europe, or his subordinates, which bear upon reinforcements or renewals of supplies will be transmitted to the Chief of the Embarkation Service; and in general, under the supervision of the Chief of Staff, this officer is charged with the duty of arranging that all supplies for our forces in Europe shall be forwarded in the most expeditious and convenient manner, and to that end he is authorized to call upon all supply officers for information and to exercise control in matters of shipment, both within the territory of the United States and in the overseas haul.

The Embarkation Service was the agency by which the War Department exercised its control over the ports of embarkation and all the other agencies of the War Department in so far as they were directly concerned with embarkation. At first the service occupied itself with controlling and supervising the ports to the end of coordinating them with each other and of meeting the cabled requirements, permitting the general superintendents of Army Transport Service at the various ports to continue to perform actual operations as theretofore, but gradually control was centered in Washington. The functions which the Embarkation Service performed at the beginning, either directly or through the general superintendent of Army Transport Service were: (a) To allocate the troops and freight to the various transport vessels; (b) to supervise the loading of the troops and freight; (c) to prevent the shipment of freight to the port before the port was ready to handle it; (d) to trace the movement of freight which was urgently needed for shipment.

The scope of its operations was indicated in an office order of February 16, 1918, dividing the work of the Embarkation Service primarily into those of a military and those of a commercial character as follows:

The activities of the Embarkation Service will be conducted by two operating divisions:

(a) Those of a purely military character under the commanding generals, ports of embarkation for the several ports.

(b) Those of a purely commercial character, having to do with operation, repair, coaling, supplying of ships under the administration and control of the Shipping Control Committee appointed by the Secretary of War.

Because of the fact that the actual work of handling the transports was done by the general superintendent, Army Transport Service, while the work was under the jurisdiction of the Water Transportation Branch of the Quartermaster Corps, and that this office became an integral part of the port of embarkation in effect reporting to the Embarkation Service, there was no break in the taking over of transport control. The Water Transportation Branch had a clear legal status, a technical organization, and a complete set of records. It should be said, therefore, that at this period the Embarkation Service performed certain of its functions through the Water Transport Branch. Among these functions may be included the chartering, financing, constructing, and repairing of vessels.

Aside from these duties which were performed by the Embarkation Service through the Water Transportation Branch, the division of duties between the two organizations was not functional but related to the destination of the troops and supplies. All troops and

supplies destined for the war zone were moved under the jurisdiction of the Embarkation Service. All other movements of troops and supplies were made, as stated above, either under the Transportation Division of the Quartermaster Corps, or, in the case of supplies, by the supply bureaus, either alone or in cooperation with the Transportation Division.

At the end of the fall, 1917, the situation at New York had become so tangled, due to the large number of allied and commercial shipments as well as United States military shipments that were being consummated through that port, that the Secretary of War took the action, in November, 1917, of appointing the War Board of the Port of New York. It was vested with full power and authority "to make rules and regulations for operating the facilities of the port; to determine priorities and to do what was necessary to promote the prompt and economical dispatch of the duties in and about the port." This body performed useful service in assisting to remove the congestion at New York. Its duties later passed to the Shipping Control Committee. This was a body appointed by the Secretary of War by letter of February 7, 1918, which defined its duties as follows:

1. To allocate the tonnage available at the port to the various uses.
2. To distribute the tonnage.
3. To arrange for exchange of ships for the War Department.
4. To load and unload.
5. To arrange for coaling, provisioning and repairing.
6. To manage the docks, piers, and loading facilities of the War Department and all ships whether of the War Department or not, while in the harbors.

Of these functions, the first three had been performed by the Ship Operations Branch of the Embarkation Service direct, and the last three had been performed by the general superintendent, Army Transport Service. The execution of these functions by the Shipping Control Committee was carried out in harmony with the Embarkation Service, through representatives of the committee at every port of importance. The committee performed a useful service in improving loading efficiency and thus reducing the stay of transports while in port.

The mechanism for arranging freight shipments at this time was as follows: The supply bureau having material to be shipped to the American Expeditionary Forces first obtained an authorization which was called a transportation release from the Embarkation Service officials, and then made its arrangements direct with the carrier, or if the shipment was large, with the agent of the American Railway Association. These transportation releases were at first granted by the commanding general of the port, but after October, 1917, by the Embarkation Service in Washington. The issuance of the release was contingent on the capacity of the port to take care of the shipment promptly, and the fact that the right to grant this permission was transferred from the port to the Washington office of the Embarkation Service is indicative of the extent to which the centralization of control took place.

In the adoption of the release system may be seen the first step toward the highly effective plan of traffic control which later solved the difficulties of congestion, both at the ports and on the railroads. This congestion had resulted primarily from the bureau system of

procurement, a system of uncoordinated purchases, of many premature and unnecessary shipments, of competition for transportation facilities in which shipments of supplies were not in any way synchronized or coordinated with the developing Army program, a system which inevitably resulted in an uneven and undirected outpouring of supplies from factories, shipments of many kinds of supplies in advance of current needs, inefficient utilization of cargo space, the clogging of port and storage facilities, and the jamming of traffic far inland from the seaboard.

The proper principle of control was struck in the establishment of the release system. The procuring bureaus were put under obligations to initiate shipments by rail for embarkation only upon release by the Embarkation Service, the release signifying that the supplies concerned could or would be adequately handled at the port. The system was extremely effective because it checked the causes of congestion at their sources—the points of origin of supplies. Unfortunately the obligations imposed were not always observed by the procuring bureaus and the Embarkation Service was at first without power to make its control mandatory. This became possible later, however, after the establishment of the Division of Inland Transportation, which, being an agency not only of the War Department but of the Railroad Administration as well, was able, through its transportation orders, to make the principle of control of shipments at points of origin mandatory upon the carriers.

Storage and Traffic Service organized.—In December, 1917, with freight congestion becoming daily a more serious problem, it was realized that a more comprehensive scheme for unified control of the movement of Army supplies was needed than had been included within the scope of the Embarkation Service. Accordingly the Storage and Traffic Service, which has already been described in some detail, was organized and to its director the Chief of the Embarkation Service was ordered to report. The appointment of a Director of Storage and Traffic brought under one jurisdiction the whole problem of the movement and handling of Army supplies from the time they left the factories to their landing in France or delivery to camps in the United States. On February 9, 1918, the powers and duties of the Director of Storage and Traffic were set forth in General Orders, No. 14, which reorganized the General Staff, made him one of the five assistants to the Chief of Staff, and charged him with:

(a) All movements of troops, as well as of munitions and of supplies of every kind, including raw materials and finished products, both during manufacture and after assembly, to points of embarkation, interior points and overseas points, and in and out of all storage.

(b) All inland traffic, embarkation service, and overseas service relating to the Army program, including the employment of all Army transports engaged in the trans-Atlantic service, and such commercial shipping as may be used to supplement that service, including all arrangements with the Navy Department for convoy service.

(c) Direct correspondence between the Director of Storage and Traffic and the commanding officers of ports of embarkation is authorized * * * in general, this officer is charged with the duty of arranging that all supplies for our forces in this country and in Europe shall be forwarded in the most expeditious and convenient manner, and to that end he is authorized to exercise control of Army shipments, both within the territory of the United States and as the same relates to the overseas haul.

The creation of the Storage and Traffic Service had the effect of setting up under the Director of Storage and Traffic a definite and comprehensive organization through which the Secretary of War and the Chief of Staff were enabled to control the whole intricate flow of Army supplies and to regulate all of its tributaries in accordance with the progress of the Army program. The Embarkation Service was already a going concern, and the creation of the Storage and Traffic Service made no immediate change in its organization, functions, or relationships. To carry out more completely, however, the broad powers of the Director of Storage and Traffic, the Division of Inland Transportation was created as coordinate with the Embarkation Service. Through it was issued the order to the newly Government-controlled railroads which required them to refuse shipment of supplies not requested on its order, which in turn issued upon the securing of an Embarkation Service release.

Jurisdiction over inland transportation had originally been vested in the Embarkation Service, but its efforts had been restricted to the control of shipments under the release system and the tracing of shipments of supplies for which there was urgent need for embarkation overseas. The consolidation of the railroads into a single system under Government control opened the way for a much more complete supervision of the shipment of supplies in this country by the Inland Transportation Division.

Reorganization of Embarkation Service.—The Embarkation Service maintained a singular continuity of organization and existence in a period when constant adjustment and readjustment was the rule. When the Storage and Traffic Service developed into the Purchase, Storage and Traffic Division in April, 1918, the Embarkation Service became one of the four main subdivisions of the division. When the latter organization was reorganized during the latter part of August, the Embarkation Service continued as one of the main operating departments.

Its internal administration also met with little change. The organization as given by the Chief of the Embarkation Service in a report to the Director of Purchase, Storage and Traffic included four subdivisions or sections, which, with their main functions, were as follows:

1. *Administration Section.*—In addition to performing usual routine services, operated courier service; transmitted sailings, cargo, and troop data to the Service of Supply by cable; had charge of baggage, remains, and effects; and of all records, including troop, cargo, and ship statistics.

2. *Passenger Section.*—Maintained records of all troop movements overseas and returning, including a log of each organization from date reported ready for overseas service by Operations Division, General Staff, until reported landed at European port.

3. *Ship Section.*—Maintained liaison with United States Shipping Board and Shipping Control Committee in keeping Chief of Embarkation advised at all times of ships available for troop and cargo service, and in making recommendations as to equipment, repair, and maintenance of ships in service and those that might be acquired.

4. *Cargo Section.*—Control over movement of supplies pertaining to the several supply bureaus from points of manufacture or storage to the seaboard for immediate loading or temporary storage, and of assignment of those supplies to ships for transportation abroad in order to meet schedules fixed by commanding general American Expeditionary Forces. Maintained close liaison with all supply bureaus and kept records of all shipments overseas pertaining to all bureaus. Also maintained liaison with Inland Transportation Branch in fol-

lowing up shipments toward the seaboard, in order to prevent congestion en-route and at the port, and to secure adequate stores at the ports for loading on ships.

It will be noticed that no provision was made in any of these sections for financing, chartering, or constructing and altering vessels. As has been pointed out, these functions were carried on by the Water Transportation Branch, during the greater part of the war period as a separate entity. In November, 1918, however, the Water Transportation Branch was assimilated into the structure of the Embarkation Service whose organization was altered somewhat in the process.

The Embarkation Service, as has already been pointed out, had developed a fairly permanent organization as early as December, 1917. From this time on it built up the tremendous working agencies at the two primary ports and the expeditionary depots at the other ports which made possible that never-faltering procession of men and munitions, so heartening to the Allies and so disconcerting to the enemy, across the Atlantic. It followed the movement of these troops and supplies from point of origin in this country to port in France.

In the matter of troops, the priority as laid down by the Operations Division of the General Staff was carried out by the Embarkation Service. As fast as troops were reported ready, the Embarkation Service took charge of the movement. The orders for the movement were written in the Embarkation Service and the Inland Traffic Service was requested to arrange for rail transportation.

After a division had been given its original order to report to a port, the details of the movement were then in the hands of the commanding general of the port who called in the various units as fast as he was able to receive them.

The overseas orders of all casual officers were also submitted to the Director of Embarkation and his approval and release obtained before the orders were published by the Adjutant General. This had the advantage, first, of affording an opportunity to check transportation requests and prevent officers from being given orders to go overseas without authority either from the commanding general of the Expeditionary Force or the Chief of Staff or the Director of Operations; second, of affording the Embarkation Service the opportunity of making the officers' transportation arrangements.

Every ship that could possibly be spared was negotiated for by the Director of Embarkation. His efforts brought forth ships from all nations and from all ports of the world. They were obtained upon numerous and various conditions of charter and hire. All were pressed into our service in the least possible time.

Direct communication was authorized between the Director of Embarkation and the Chief of Naval Operations, Navy Department. This enabled these two services, necessarily closely related, to work together with the utmost harmony and cooperation, to the end that the repairing, converting, conveying and provisioning of ships operated by the Navy was accomplished to the entire satisfaction of the Army.

One of the difficulties solved by the Director of Embarkation was that of maintaining secrecy in all of his activities. Practically every move made in his rapidly increasing organization required the utmost

secrecy. To accomplish this, all ships were designated by constantly changing codes, cables giving sailing information together with description of troops and cargo were sent through the secret channels of the Navy Department, and every order affecting the movements or locations of either troops or ships was handled most confidentially. It might be added that so well was this feat accomplished that the announcement of the safe arrival of the first million men overseas came as a complete surprise to the entire country. It was possible also for the sailing of troops to be terminated 11 days before the signing of the armistice without the fact coming to the attention of the public.

In the following up of the cargoes, a complete record of every shipment was kept in Washington from the time the article was reported ready and released to the Inland Traffic Service until it arrived overseas. Liaison between the supply bureaus and the Director of Embarkation was maintained at all times and a section in charge of the movement of the supplies of each bureau was established in the Embarkation Service. The system of releasing freight by the Embarkation Service assisted tremendously in clearing up the freight congestion which occurred in the winter of 1917-18.

The following up of all cargo destined for overseas was maintained by the Embarkation Service for its own benefit as well as for the benefit of the other bureaus of the War Department who were dependent upon these records. They showed the status of all shipments at all times, and furnished information for estimates, shipping schedules, and tonnage allocations, as well.

The outstanding achievement of the Embarkation Service was the bringing of order out of chaos in the situation which existed at the ports. In so doing it eliminated all congestion, made proper provision for the equipment of troops as they were sent overseas, brought into the service of the Army a very large increase in tonnage whereby the monthly number of troops transported was brought up to approximately 300,000, directed the transportation of all of the subsistence and supplies required for the overseas army and in so doing apportioned the available cargo space to the various goods to be transported so that, in so far as supplies were available, shipments were substantially in accordance with cable requirements. Such accomplishments would have been outside the range of possibility had arrangements for shipping been left to be worked out along independent bureau lines.

Transport fleet.—At the outbreak of the war our transport service consisted of few vessels; as a matter of fact, there were seven actually under the control of the War Department. Most of these were then operating in the Pacific. A start was made by chartering a few of the American merchant steamers immediately at hand, and by the end of June, 1917, there were in the service troop ships with a dead-weight of 46,000 tons and six cargo ships with a dead-weight of 48,000 tons. From this small beginning there was developed the trans-Atlantic fleet which, on November 1, aggregated 512 vessels with a total dead-weight of 3,251,000 tons. In addition to this a cross-channel fleet was built up numbering 104 vessels with an aggregate tonnage of 311,000, making a total fleet of 616 vessels.

In building up this fleet, the first great increment in the matter of troop transports came by the seizure and taking over of German

interned vessels, which entered the service during the fall of 1917, aggregating 460,000 dead-weight tons. In the spring of 1918 the taking over of the Dutch vessels gave the Army an additional 300,000 dead-weight tons.

Troop movement.—On June 30, 1918, 100 British and allied vessels were finally engaged in the transportation of the great American Army overseas.

The Embarkation Service sent overseas more than 2,000,000 men and approximately 9,000,000 tons of cargo over a line of communication 3,500 miles long, subject to constant attack by enemy submarines. Such a performance has not been excelled in any war.

Return troop movement.—When the armistice was signed the total troop capacity of American flag transports, under the control of the United States, was 111,783 men. It was quite evident that the War Department could not expect from the allied Governments the same assistance in the return of American forces that we had received in transporting them overseas, so it was necessary to devise other means of promptly bringing the American Army home.

Immediately following the signing of the armistice, steps were taken by the Director of Embarkation to increase the American transport fleet as rapidly as possible. The work of converting some 58 cargo transports was promptly undertaken; the Navy assigned battleships and cruisers for transport service; 10 German passenger ships were obtained and equipped for carrying American troops; and the War Department negotiated successfully with the Italian, French, Spanish, and Dutch for the utilization of suitable passenger vessels for the return of the American forces. These steps increased the troop fleet operating in the return of the American forces to a maximum of 173 vessels in service on June 23, 1919. This fleet was made up as follows:

	Number.	Capacity.
American flag transports.....	141	364,069
British.....	4	5,621
Italian.....	13	27,572
French.....	8	10,954
Spanish.....	4	4,185
Dutch.....	3	6,850
Total.....	173	419,251

The return movement reached its maximum during the month of June, when all records heretofore established were broken by the embarkation in French ports of 364,166, and the landing in American ports of 343,786.

With all the shipping that the Allies could muster during the emergency in the spring and summer of 1918, it was possible to transport only a little over 306,000 American troops in any one month. In spite of the fact that at the signing of the armistice on November 11, 1918, the American-flag transports of all kinds had a capacity of barely 110,000 troops per month, operated at maximum efficiency, yet it will be noted that during the month of April, 1919, there were transported on American-flag ships alone 246,209, and in June of the same year United States tonnage returned 327,654 American troops.

When this fact becomes fully realized in military and shipping circles, the real magnitude of our overseas transportation operations will be more fully appreciated. From November 11, 1918, to June 30, 1919, 1,608,873 of the American forces embarked from France, and during the same period 1,476,707 landed in the United States. On May 31, 1919, there were 180,681 troops on the water between France and the United States. This was the greatest number of troops on the water at any one time during the overseas operations. The part played by the original 19 German vessels taken over in the United States ports upon the declaration of war is shown by the fact that they alone transported to France an army of over half a million men, and up to June 30, 1919, had returned 409,516 of that number to the United States. In all, they transported safely, both ways, 931,619 of the American forces, and of this number the transport *Leviathan* carried 175,571.

THE INLAND TRAFFIC SERVICE.

The Inland Traffic Service formed the third great arm of the Director of Purchase, Storage and Traffic in carrying out his control of the supply activities of the Army. Its operations as the Inland Transportation Division have been touched upon in the account given of the Embarkation Service, with which it worked in close association in effecting the transportation of overseas troops and supplies to the seaboard. A more complete discussion of its development is necessary to a complete understanding of traffic supervision during the war.

Early transportation arrangements.—Previous to 1914, arrangements for the movement of troops by rail were made through direct negotiation with the carriers initiated by the depot quartermaster at the point where the movement was to start. When a crisis with Mexico threatened in May, 1914, and the port of Vera Cruz was occupied by the United States forces, the Quartermaster General, anticipating a possible heavy movement of troops, requested that the American Railroad Association appoint a representative in Washington, with whom the Quartermaster General might confer on the question of handling the anticipated large shipments of troops and supplies, so that the greatest possible cooperation between the Government and the railroads might be obtained. This request met with the approval of the railroads, but the emergency passed before definite action was taken. This may be considered the first foreshadowing of the later Embarkation Service and Inland Traffic Service of the War Department.

No further steps were taken for more than a year, when in October, 1915, the American Railway Association appointed a committee to confer with the Quartermaster General on the subject. This committee, composed of the presidents or vice presidents of several important railroads, in conference with the Quartermaster General, established a bureau to represent the railroads in the handling of War Department transportation, and developed a plan whereby railway representatives should be detailed at critical points to assist the War Department officials.

The Council of National Defense was formed August 29, 1916. In February, 1917, the American Railway Association, acting with the

approval of the Council of National Defense, appointed a committee called the Railway Committee on National Defense, to devise ways and means by which the railroads could most suitably cooperate with the Government in the event of a war with Germany.

In accordance with the recommendation of this committee, a permanent committee or board, which was later called the Railway War Board, was appointed, composed of representatives of the railroads, with a representative for each of the six territorial departments of the United States, taking upon itself the duty of directing the operation of the railways, so far as they affected military movements and coordinating the various roads with each other, in so far as the public necessity required. Furthermore, officials known as department general agents were placed at the headquarters of each military department, reporting both to the Railway War Board and to the department quartermasters. Agents, called camp general agents, responsible to the department general agents, were placed at each mobilization camp or military post. These were all officials of the American Railway Association and wore brassards with the initials A. R. A.

This committee, starting out with a comparatively small number was enlarged to 28 and finally to 33 members, including the executives of most of the important railroads of the country. Some time after its creation the name of this committee was changed to the Railway War Board, and its operations were carried on to the end of effecting one unified system of all the railroads of the country.

The Railway War Board was, with the exception of the salaries of the military members, maintained at the expense of the railroads. Its functions were:

- (a) To regulate the car supply.
- (b) To give preferences to the sources of supply and movements through congested areas.
- (c) To eliminate duplication of service by roads operating in the same territory.
- (d) To coordinate and produce cooperation between the railroads. In addition, it furnished material and personnel for the rehabilitation of the French railroads.

The camp general agents, under the direction of the military authorities, made all local arrangements for the transportation of troops and supplies to and from the camp, including the arranging of schedules, and the securing of the necessary cars.

Under the authority of the Railway War Board, instructions were prepared as to the handling of troops and supplies, which, with the approval of the War Department, were promulgated to all the interested carriers.

The headquarters of the Eastern Department being located at Governors Island, N. Y., the department general agent for the Eastern Department had his offices there. A representative of the department general agent was, however, located in the office of the general superintendent of the Army Transport Service. At this time the largest movements of troops were from one camp or cantonment to another, shipments overseas being still very small. Thus the railway movements for troops intended for overseas could be handled by the representative of the department general agent.

As the overseas movements gradually became more important, beginning about January, 1918, it proved advantageous to move the

office of the department general agent to the quarters of the general superintendent of Army Transport Service. The formation of the Embarkation Service on August 4, 1917, effected no material change in the actual mechanism for the handling of troops.

There was a subcommittee of the Railway War Board on military passenger traffic which supervised the routing of troops and effected their expeditious movement. The United States Government took over the control of the railroads in December, 1917, but this made no important alterations in the mechanism which has been described. The Railway War Board and the department general agents and camp general agents became agents of the troop movement section of the Railroad Administration. Among the duties performed by the Railway War Board were the arrangement for a uniform rate for military traffic over the various railroads of the country, and plans for the conversion of cars from one type to another as might be needed by the Military Establishment.

The transportation of freight was originally in the hands of the transportation officer of the supply bureau directly concerned. If the movement was small, the transportation officer made the arrangements directly with the carrier as any other individual would do. If, on the other hand, the amount of transportation required was sufficiently great as seriously to affect the traffic, the question of transportation was taken up by the transportation officer with the local or departmental general agent of the Railway War Board of the American Railway Association.

The scheme of transportation was not altered until in September, 1917, subsequent to the formation of the Embarkation Service, when transportation officers in the supply bureaus were required to obtain the permission of the commanding general of the port before shipping any freight to a port of embarkation. This consent was given in the form of the transportation release. After November, 1917, the granting of this transportation release was done by the Embarkation Service in Washington, in place of the commanding general of the ports direct. The Embarkation Service had, as already pointed out, no effective mechanism for holding up shipments at point of origin, such as, through the Railroad Administration, the Inland Traffic Service afterwards developed. In the absence of such effective mechanism the regulation was to a considerable extent disregarded by shipping officers of the supply bureaus.

Each of the supply bureaus had its own machinery for the handling of its transportation problems. Of these bureau transportation units perhaps the most complete was that of the Supply Division of the Ordnance Department. This ordnance transportation branch covered the entire field, with officers to contract for the transportation, officers to expedite shipment, and officers to handle the finances. An organized force of officers in the field was charged with the duty of handling all inland transportation matters.

In the Quartermaster Corps arrangements for shipment were made by depot quartermasters, many of whom, however, had officers detailed to the sole duty of taking care of transportation matters. These officers were utilized to make the arrangements as well as to follow and trace shipments. But the Quartermaster Corps did not develop a field force such as grew up in the Ordnance Department with the exclusive function of handling transportation matters.

In the other bureaus the arrangement was more similar to that of the Quartermaster Corps than to that of the Ordnance Department, and there did not exist such an extensive field force as the Ordnance Department possessed. On account of the fact, however, that the transportation problems of the other corps were smaller than those of the Quartermaster and Ordnance Departments their transportation branches were correspondingly of less importance.

Competition among the bureaus.—The conditions leading to the creation of the Inland Traffic Service furnish one of the most striking illustrations of the need which arose for coordinating the work of the several bureaus. The Army bureaus and other procuring agencies competed with each other not only for the products of industry, and for raw materials and for manufacturing facilities, but they were also in blind competition for transportation facilities. The responsibility which rested upon each bureau and upon each of the numerous divisions and subdivisions of the bureaus was to procure and to deliver in France the particular supplies, materials or munitions with which it individually was charged. The quartermaster officer buying shoes for the American Expeditionary Force felt no concern for any possible shortages in railway, warehouse, or steamship facilities from which some other division or some other bureau might be suffering. Nor did the Engineer Corps worry over getting forage or clothing or small arms from the farm or factory to the front. Neither was informed as to the transportation needs of the other units nor as to its own proper proportion of the whole. Each was responsible for its own task alone.

Naturally the inevitable result followed. In the placing of contracts the emphasis was all upon speed, and as the productive facilities of the country responded to the urgent demands of the hundreds of procurement officers, a vast stream of supplies began to flow over the railroads toward the ports of embarkation. Even as absolute quantities the shipments were soon in excess of the carrying capacity of the available ship tonnage, and congestion began at the ports. The universal pressure for speed resulted in shipments of Army articles greatly in excess of current needs. And with the submarine steadily making the available tonnage still more inadequate, such excess shipments meant either that the articles would be sent to France in cargo space more needed for other things, or that they would be held at the ports (as they were held in some instances until the end of the war), taking up much needed space and hindering the flow of the great current of supply.

It has already been pointed out that the Embarkation Service had imposed upon the shipping officers the requirement that goods should not be shipped for overseas unless on a release granted by the Embarkation Service. But the mechanism was lacking for putting this regulation into effect.

The result was a great congestion of freight at all important centers of traffic, great shortage of cars due to the fact that so large a number were standing to be unloaded, and at the very time when prompt unloading was so necessary, a great congestion of the unloading facilities. This condition instead of improving was rapidly becoming worse. Toward the latter part of December, 1917, the Government took over the railroads, in order to facilitate their oper-

ation as a single unit. But the Railroad Administration did no more, functionally considered, than step into the shoes of the carriers. In addition to all the steps yet taken, there was still need for an agency to direct, coordinate, and take care of Army transportation by rail.

The Division of Inland Transportation established.—Accordingly, arrangements were made by the newly appointed Director of Storage and Traffic for the securing of competent personnel and on January 10, 1918, there was appointed a Director of Inland Transportation and his functions were defined as follows:

1. He shall have jurisdiction over all matters pertaining to the routing and transportation, inland, of all troops and property by whatever means of transport. Bureau chiefs, commanding officers, depot quartermasters, and all other officers shall provide such assistance, information, and reports as may be required from time to time.

2. He shall prepare and promulgate for the information and guidance of those interested a system and uniform plan for conduct of the business of the division.

3. He shall be the chairman and exofficio member of the Priorities Committee of the War Department, established by the order of the Secretary of War, January 5, 1918.

The functions specified in paragraph 1 had previously been exercised severally by all the supply bureaus, and individually by local officers as the transportation was required. There had been no planning of the transportation problem as a whole.

The great task which immediately confronted the new Director of Inland Transportation was the remedying of the freight congestion which had become extremely serious. For handling this problem a method was devised which, though far-reaching in its application, was simple in principle and effective in the accomplishment of its purpose. The principle was that shipments to ports of overseas embarkation as well as to other congested points should not be accepted by the carriers at points of origin except with the approval of the Division of Inland Transportation. This approval was to be evidenced in certain cases by a transportation order which not only allowed the shipments to be made but operated as an order to the carrier to furnish the necessary transportation. It was provided that:

On and after March 1, 1919, shipments of Government property by freight in carloads, either for domestic use or shipment overseas, for account of the War Department, other than coal, or live animals, and live animals and property being moved with troops, must not be forwarded, unless authorized by a transportation order bearing the serial number and seal of the Division of Inland Transportation, War Department, to any depot, arsenal, storehouse, pier or other receiving station whether owned by the Government, the railroad, steamship company or privately, or to a Government officer or any other consignee at New York or other port of embarkation named in the order.

Supply bureaus, wishing to arrange shipments overseas, were required to obtain a release from the Embarkation Service and to present this release in applying to the Inland Transportation Division for a transportation order, without which the shipment could not move from the point of origin. The Director of Inland Transportation and certain others serving under him were officials of the Railroad Administration as well as of the War Department. It was therefore possible, through the Railroad Administration, to issue

orders mandatory upon the carriers for the application of the transportation order plan. All this was in line with the policy previously adopted by the Embarkation Service, but it was a considerable extension of it in the following respects:

1) The conditional embargo of the Embarkation Service applied only to shipments to ports of goods destined for overseas use, whereas that of the Division of Inland Transportation applied to all War Department traffic to all congested points, with such exceptions as they chose to make.

(2) The release granted by the Embarkation Service signified that the port facilities were able to take care of the shipment covered by the release. The accompanying transportation order of the Division of Inland Transportation was a guarantee that the property could and would be promptly unloaded on its arrival at the port.

Those transportation orders were ordinarily confined to shipments to the particular ports and points of congestion specified in the order; but in all cases where any Government agent or contractor was unable to get necessary transportation with sufficient promptness, a transportation order would be issued calling for immediate shipment by the carriers. Under these circumstances the Inland Transportation Division not only issued the order but took all necessary steps to see that it was complied with. There were other important features of the plan, such as the prevention of unduly large shipments by express, etc.

Plan of organization.—The work of the Division of Inland Transportation was divided under two natural heads namely, property movement and troop movement, and its organization corresponded to this division.

The Property Movements Branch was subdivided to correspond with the various supply bureaus of the Army. The function of the Property Movements Branch was to take all the necessary steps of any kind and character whatsoever in regard to rail movement of property for the Army, with the exception of the actual making of the transportation contract. It took care of the transportation orders for the movement of property, made arrangements concerning the imposing and lifting of embargoes, the furnishing of cars and equipment, the tracing and expediting of shipments, etc. To facilitate its operations a complete car record office was set up by the Railroad Administration immediately adjacent to the quarters of the Division of Inland Transportation. This office was operated by experienced car accountants and along lines which the railroads had developed by long experience. The office served not only the Army but the Shipping Board and the Navy. In other words, it was an office which kept records of the movements by rail of all Government property.

The function of the Troop Movement Branch was to serve as a connecting link in the matter of arrangements for the movement of troops between the Railroad Administration on the one hand and the various parts of the Army organization concerned on the other. Such movements were of course ordered in the first instance by the Division of Operations of the General Staff through The Adjutant General. To the extent that they related to embarkation overseas, they concerned the Embarkation Service and the commanding generals of the ports. The department quartermasters and the camp authorities involved were also interested parties.

In the matter of moving troops for embarkation overseas, it was customary for the Chief of Embarkation Service to formulate in advance a program of the organizations to be released during the succeeding month. These programs were laid before the Railroad Administration and general plans made for carrying them out. As the time approached for actual movements, routes and dates were arranged by the Railroad Administration, and when approved by the Army authorities instructions were issued to the various railroads concerned with the transportation of the troops. The Railroad Administration maintained a Troop Movement Section charged with the responsibility for this work. The Troop Movement Branch of the Inland Traffic Division was always in close contact with this section. An idea of the scope of its activities may be gathered from the fact that it assisted in making the arrangements for the movement of approximately 5,000,000 men.

The field force which had been developed in the Ordnance Department was instructed on January 15, 1918, to report to the Division of Inland Transportation. In that division it was made the nucleus for a field force which was to do for all War Department shipments what theretofore it had been officially doing for the Ordnance Department only.

The Division of Inland Transportation was by an order of April 22, 1918, renamed the Inland Traffic Service and its functions were considerably enlarged by an order issued June 8, 1918, by The Adjutant General. This order abolished the separate transportation units in the various bureaus and transferred their functions to the Inland Traffic Service, with the result that all Army transportation matters came to be more completely centralized in that office. In the same order a set of branch offices in important cities was provided for and also numerous district offices of many points throughout the country.

In addition to the evils described as flowing from the competition which in the early days of the war existed among the bureaus, the Inland Traffic Service found an important difficulty existing in certain provisions of War Department contracts. These contracts frequently included an obligation on the part of the War Department to accept and move the property from the manufacturer's plant immediately upon its completion. This obligation was an important influence in bringing about shipments which could not be handled at the point of destination and which therefore tended to create railroad congestion. These provisions were substantially nullified by the system of control at point of origin inaugurated by the Inland Traffic Service, although this action gave ground for later claims against the Government on the part of contractors who through this control were put to additional expense in storing goods which the Government had contracted to take over as soon as completed.

After the system was established of allotting to each supply bureau the amount of cargo space to which it was entitled, the Inland Traffic Service was kept informed of these allotments, and made arrangements for confining within these limits rail shipments for the respective bureaus. These arrangements supplemented in a very useful way the operation of the tonnage allotment system.

The movement of troops to ports, however, was but one part of the work of the Inland Traffic Service. In general the movement

of troops in the United States during the war may be divided into five phases:

(1) The movement of portions of the Regular Army within the United States from the Mexican border to various camps.

(2) The movement of the National Guard to its training camps.

(3) The movement of the selective service men from their homes to the cantonments.

(4) Intercamp movements to meet the needs of the service.

(5) The movement of organizations from the camps to ports of embarkation.

The first movement recorded began on May 18, 1917, when various regiments on the border began to entrain for interior points. On June 4, this movement, involving approximately 25,531 officers and men was completed. Included in this was the movement of the First Division to Hoboken for transportation to France. The movement of the National Guard troops to their camps involved the transportation of about 343,223 men, and extended over a period of 11 weeks, from August 4 to November 23, 1917. This movement was still in progress when the first detachments of the new National Army left their homes for the cantonments on September 5, 1917. The 4,581 entraining points and the nation-wide distribution of the stations to which the selected men were eventually sent, made this an extremely complicated problem. At times the railroads were called upon to handle as many as 50,000 men in one day, and to transport within a single month over 400,000 men for the selective service system alone. Of the total number of men drafted, 2,755,476 were transported to camp by roads controlled by the Railroad Administration. It is estimated that these movements represented about one-fourth of the entire troop movement of the Army. About August 1, 1917, large intercamp movements of the Regular Army commenced, in the course of which organizations were ordered from their stations to more convenient points, and recruits transported from various depots to these camps. Many troops were transported from northern to southern cantonments during the early part of the winter, and by January 1 approximately 308,000 men had been thus moved about the country. Toward the middle of October, drafted men began to be transferred from the National Army cantonments to the new National Guard divisions in order to bring them to full strength. Later in the year this process was extended to the new Regular Army divisions being formed, and throughout 1918 an elaborate process of distributing men from the depot brigades to units throughout the country was taking place. In these movements the general policy of the staff was always to move troops from the West toward the eastern coast, though this was not always possible. The intercamp movements involved about 42 per cent of the total number of men transported by rail between January 1 and November 11, 1918. Finally, every man shipped abroad had to be transported by rail to the port of embarkation before he could go aboard ship. Between the 1st of May, 1917, and the 11th of November, 1918, over 2,174,455 men were transported by the railroads to the ports. Of these 1,758,033, or 81 per cent of the total, were transported to Hoboken and the embarkation camps serving that port; 250,404 men, or about 12 per cent, went to Newport News, and the rest to other

ports. Of the total number carried to ports of embarkation during the 19 months of the war, 76 per cent (1,653,470 men) were embarked in the seven months from April to November, 1918.

The movement of a combat division from its camp to the seaboard was a complicated and difficult undertaking. The movement of the 18,819 men of the Eighth Division (which does not include its Artillery brigade) from Camp Fremont, Calif., to Camp Mills, Long Island, in October, 1918, one of the best performances in the field of inland transportation during the war, illustrates the nature of the task. The first train left camp at 9 a. m. October 18; the others at hour and a half intervals from 9 a. m. to 4.30 p. m. at the rate of six trains per day. The last train left at 4.30 p. m. October 24. These 42 trains, averaging 448 men with nearly 14 cars to the train, traversed 3,444 miles to their destination at an average rate of about 20 miles per hour, in an average time of 7 days and 3 hours. The efficient cooperation of all concerned made possible the dispatch of all trains on the minute scheduled, with the exception of two, which were, respectively, four and five minutes late. As the result of a competition in loading inaugurated among the train commanders, few trains after the second day required more than five minutes from the time of arrival of the troops in the area to the last man entrained. Fifteen trains were loaded in less than three and one-half minutes each. This movement took place in the last weeks of the war, under the efficient organization which had been developed by that time. Forty-two such divisions, the majority of much larger strength, were so moved during the war, albeit under much greater difficulties.

From May, 1917, to November 11, 1918, the railroads of the country transported 8,714,582 men, an average of 502,764 per month. The maximum was reached in July, 1918, when 1,147,013 men were moved. Of the total number of men moved during the war about 26 per cent were drafted men on their way to camp, 25 per cent were troops moved toward the ports, and the remaining 49 per cent represent the mobilization of the Regular Army and the National Guard, and the intercamp movements. In this task it was not found necessary, as in Europe, to utilize freight cars for the transportation of troops, and in the majority of cases sleeping cars were furnished for journeys of over 24 hours duration. About 31 per cent of all troops moved were supplied Pullman cars.

Detailed arrangements for handling over 8,500,000 troops have been made by the Passenger Traffic Branch since July 1, 1918. This has involved handling 11,722 special trains averaging per train, 10.7 cars, 31 hours, 632 miles, 22 miles per hour, and 434 passengers.

It will also be noted that 1,494,533 troops have, by June 30, 1919, been returned from overseas since December, 1918. These troops, after arrival at the port of embarkation, were segregated into detachments and sent to the camps nearest their homes. This system made a much more complicated proposition than the movements for embarkation overseas. In the latter case, troops were moved as complete organizations to one destination; but, on the return trip, an organization may have been divided into 10 or 15 detachments for as many destinations. These movements were further complicated by the fact that it was the policy of the War Department to grant, as

far as possible, the many requests for the parading and entertainment of troops at various points en route to their destination. The details of such arrangements all passed through the Inland Traffic Service, and something over 400 parades and stops for entertainment were authorized. In some cases as many as three or four stops were made by one organization, in many instances consisting of several trains and from two different ports, necessitating the consolidation of trains at the various points in order to form one parade.

Achievements of the Inland Traffic Service.—The traffic congestion which confronted the Inland Traffic Service at the very outset is a typical illustration of the conditions which were bound to result, in a war of such great proportions, from the bureau system of organization. The achievements of the Inland Traffic Service similarly afford a very convincing proof of the benefits which flow from efficient unified control. The problem which confronted the Inland Traffic Service was essentially a railroad problem. The personnel of the service was very largely recruited from experienced railroad men. A study of the problem which the service had to solve and of the efficient way in which the solution was achieved leads almost inevitably to the conclusion that if the independent activities of the bureaus in shipping war supplies had been subjected in the summer or fall of 1917 to the kind of control later established, the traffic congestion of the following winter might have been avoided in a very large degree and might possibly have been prevented altogether. In spite of the very serious conditions existing when the Inland Traffic Service began its work, the freight congestion was removed within a few weeks after its system of control was put into effect and from that time on movement by rail of Government supplies was always well under control.

THE STORAGE BRANCH.

The final service involved in the administration of the immediate problem of supply and forming a fourth arm of the Purchase, Storage and Traffic Service was that of storage, which dealt with all matters centering about the custody of supplies held for use in this country, in reserve or for shipment overseas.

In giving the account of storage control during the war it is necessary to bear in mind the fact that the development proceeded from absolute decentralization among the various bureaus toward complete centralization of control under Purchase, Storage and Traffic. This development was not fully consummated while the war lasted. There was an intermediate period during which supervision of the storage activities of the bureaus was exercised. Toward the end of the war complete centralization of control was begun, but it was interrupted almost at once by the signing of the armistice.

It must be borne in mind that storage was preponderately a quartermaster problem and that storage control by the Purchase, Storage and Traffic Division grew largely out of the Quartermaster Corps. The subject was very closely related to the supply bureaus, and a clear picture of the storage situation in the Army when the United States entered the war is essential.

The storage systems of the bureaus.—Under the scheme of organization existing in the office of the Chief of Ordnance at the outbreak

of the war there was no central agency for the handling of storage. However, a supply division was soon created and assumed the functions of storage and custody. By the early part of 1918 Ordnance general supply depots had been classified into four main types, according to the nature of the work they had to do and the place they held in the scheme of distribution. These were: (1) Assembly depots, (2) reserve depots, (3) district depots, and (4) embarkation depots. In addition to these four types there were other spaces in ports, in warehouses, or on piers available for the storage of ordnance material. The principal storage problems of the Ordnance Department had to do with the creation of special facilities for the storing of explosives.

Before the Signal Corps was split up into three distinct organizations it had jurisdiction of all planes and parts, as well as all materials and equipment for the use of the Signal Corps proper. With the reorganization there went a division of the existing depots and storage facilities among the Department of Military Aeronautics, the Bureau of Aircraft Production, and the Signal Corps. The Bureau of Aircraft Production received only three whole or partly completed projects out of the 21 original depots belonging to the old Signal Corps. As regards organization, storage matters in the Signal Corps were handled by the Distribution Department of its Supply Accounts Division. The Distribution Department exercised operating control over the several Signal Corps general supply depots and all Signal Corps activities at ports of embarkation. Storage matters in the Bureau of Aircraft Production were handled by its Purchase, Storage and Traffic Division.

The storage problems of the Engineer Corps were dealt with at Washington by the General Engineer Depot, which was a part of the organization of the Office of the Chief of Engineers. This depot had charge of the purchase of all engineering supplies in addition to storage. The latter function was exercised by the Depot Department, which was burdened, besides the administration of the various engineer depots throughout the country, with various questions relating to facilities, personnel, and uniform systems of operation. Three large departmental depots were maintained as well as a number of subdepots at various cantonments for the issue of matériel. The space needed for this was small and not specialized. Stores destined for shipment overseas were handled directly from the producer to the port of embarkation. There were two engineer embarkation depots with small depot forces maintained at a half dozen other points on the seaboard. The main items of storage were structural steel, wire and wire netting, locomotives, freight cars, and railway material. These presented problems of open storage mainly.

In amount of floor space required for storage the Medical Corps ranked third among the supply bureaus. The principal items were beds, chairs, and hospital equipment. The requirements for storage space for the reception of these supplies increased so rapidly after the outbreak of war that new buildings had to be added from time to time. Overseas embarkation warehouses were in operation at the two principal ports of embarkation and subsidiary supply depots were established at all camps and cantonments.

When the war began there were 13 general supply depots operated by the Quartermaster Corps, which contained about 70 or 80 per

cent of the storage floor space occupied by all of the supply bureaus together. A fourteenth was added later. These depots were administered under an extremely decentralized system. All supervision over the supply of posts, camps, etc., was in the hands of the six territorial departments of the Army, conducted by the department commanders and under them, by the department quartermasters. It was not until some time later that a definite supervision was given to the Quartermaster Corps through its general supply depots over the distribution of Army supplies to camps in this country.

The functions of the general supply depots were to distribute supplies to subdepots at camps, maintain reserves, and in some cases act as embarkation warehouses. The principal problems with which the central organization at Washington had to deal concerned matters of operation and personnel rather than the actual securing of space. Almost any kind of interior space could be utilized, and no lifting machinery had to be installed for the lifting of stores. There was much more shifting of supplies in the case of quartermaster depots than in any other type of Army warehouses. Since the quantity of stores was so rigidly governed by the given number of troops to be supplied in a given district, troop movements and overseas requirements necessitated constant changes in size of stores. Food, forage, clothing, vehicles, and harness were the principal items to be considered.

The question of specialized space for cold-storage purposes was a serious one. The Government had to lease all of its cold-storage space, as it owned none. It was very difficult to secure enough cold-storage space of the right kind at a given place. It was found impracticable to use a given warehouse for both cold storage and other types of storage.

As has already been remarked, the Quartermaster Corps did not exercise as complete control over its depots as did some of the other bureaus, nor did it have the same detailed information regarding them. Each depot, while a distributing agency for a given zone, was responsible also for production within its territory, and in this bore more nearly the relation of a branch house to the central controlling agency in Washington than did the warehouse system of any other supply bureau.

The Motor Transport Branch of the Quartermaster Corps (later the Motor Transport Corps) presented a rather unique storage situation. This branch was charged with the production of and carriage to the seaboard of all quartermaster trucks. For this purpose three convoy districts were created, each district including all the manufacturing plants producing trucks within its boundaries. The trucks were moved under their own power, and whenever possible carried cargo to the seaboard. No problem of storage existed at the point of origin. The only type of storage needed at the embarkation point was open parking space for which firm ground had to be provided.

The foregoing indicates the diversity of problems, facilities, and organization of the storage function within the bureaus at the beginning of war and the length to which coordinating authority had to go before effecting any degree of unity out of the decentralized state into which this highly important supply function had fallen under the bureau system of administration.

Development of General Staff supervision of storage.—In view of the fact that, as has already been stated, the Quartermaster Corps was burdened with approximately 80 per cent of the problem it was natural that the process of central supervision of storage should be developed out of the Quartermaster Corps. General Staff coordination of storage was accomplished by attaching to the Quartermaster system the storage methods and functions of the other bureaus.

Yet the difficult nature of the task is emphasized by the fact that the system of the Quartermaster Corps was the most decentralized of all and centralization within that department alone was a slow process. As has already been pointed out, there was at the beginning no central supervision of storage in the Quartermaster Corps. It was provided by regulation that depot quartermasters should report to the Quartermaster General, but there was no provision for any directing organization within the office.

It was not until several months after the declaration of war that storage was placed under the control of a separate division of the Office of the Quartermaster General. On October 16, 1917, a Warehousing Division was created but with authority only to gather data as to storage facilities. A month later, however, it was vested with real powers to act as a supervisor and administrator of all storage and warehousing operations in cooperation with depot quartermasters and to standardize and supervise operations and maintain statistical records. There was at this time no available record in Washington of contracts for supplies which had been placed by the Quartermaster Department and it was consequently impossible to estimate even approximately the storage requirements. Procurement, and substantially all the records pertaining thereto, were in the hands of the depot quartermaster scattered throughout the country. There was no uniform method of accounting; no regular system of stock keeping; in fact, no established method of operation common to the various quartermaster depots. The depot quartermasters established their own requirements for storage space, made direct application to the Construction Division (then known as the Cantonment Division) for authority to lease or build, and secured from the Construction Division the necessary allotment of funds.

The Office of the Quartermaster General at this time was not impressed with the necessity of providing additional storage facilities and no plan had been adopted for the construction of such facilities. At Chicago an arrangement had been entered into for the construction of temporary warehouses on leased land. An appropriation had been secured for the construction at St. Louis of the initial unit of a permanent warehouse. At Baltimore a site had been selected and plans were being prepared for a temporary quartermaster warehouse. These projects were practically the only ones of importance under consideration, with the exception of the storage facilities provided in connection with the construction of the National Guard camps and the National Army cantonments.

For the handling of overseas shipments existing commercial facilities were used exclusively. The Depot Board, appointed by the Secretary of War, in conjunction with a subcommittee of the Storage Committee of the Council of National Defense, had selected the locations for two overseas depots, one at Port Newark, N. J., the other

at Bush Bluff, Norfolk, Va. In addition to these projects, the commanding general of the port of embarkation, Newport News, had obtained authority directly from the Secretary of War to construct certain warehouses at Newport News for the handling of supplies destined overseas. These warehouses were located some distance from the existing piers and were never satisfactory from an operating point of view. No funds were available for the construction of storage projects and authority to create a deficiency had to be obtained in order to provide the necessary facilities.

The control of quartermaster supplies at depots, camps, and cantonments was entirely inadequate, and information upon which to base proper distribution of supplies was entirely lacking. The activities of the quartermaster depots had expanded at such a rapid rate that the prewar organizations had already broken down, with the result that a chaotic condition existed. The greater part of the month of December was consumed in efforts to obtain reliable data upon which to base a storage and distribution plan, and the beginning of the year 1918 found but little improvement in the general situation.

The ensuing two months was a period of considerable confusion in the Quartermaster Corps owing to a series of reorganizations which were effected in rapid succession in an attempt to construct machinery which could cope efficiently with the new conditions. When the Storage and Traffic Service was established on December 28, 1917, the Acting Quartermaster General was appointed Director of Storage and Traffic. This double appointment resulted naturally in a very close connection between the two offices but at the same time added to the general administrative confusion which prevailed in the transition process, and it was frequently difficult to determine the precise line between the two.

The Storage and Traffic Service was organized "to enable the Chief of Staff to exercise effectively his supervisory and coordinating powers in respect to the movement and storage of supplies * * *," and when the General Staff was reorganized, on January 9, 1918, into five main divisions, the Storage and Traffic Service continued "to have cognizance and control of the distribution of all branches of the Army and of all munitions and other supplies of the Army, both by land and sea, and the storage facilities in connection therewith * * *."

The supervision of storage thus became one of the two primary functions of the Director of Storage and Traffic and his combined directorship over this office and the Quartermaster Corps was another cause why the development of General Staff storage supervision proceeded naturally out of the Quartermaster Department. On January 11, 1918, after several preliminary readjustments, there was appointed in the office of the Quartermaster General a Director of Storage in charge of the Storage Division of that office. On February 10, 1918, the Director of Storage of the Quartermaster Corps became Chief of the Storage Division of the Storage and Traffic Service, being relieved of his Quartermaster function by an officer who took charge of the Warehousing Division into which the Quartermaster Storage Division had in the meantime again been changed. While the storage organization of the Storage and Traffic Service

was not given formal shape until February 9, 1918, storage supervision under that service was actually exercised for some weeks earlier under the single officer of the two organizations.

The organization of the storage supervision function was originally outlined on January 26, 1918, but this scheme was never put into effect, and was followed on February 9, 1918, by Storage and Traffic office order No. 1 (supplementary) which provided a substantially different type of framework. This took the form of a Storage Control Subdivision of the Storage and Traffic Service and included operating sections and subsections to handle or supervise and coordinate all of the matters and work related to storage and warehousing of property, whether for purposes of collection and concentration from places of purchase and manufacture, depot storage for distribution, or assembly at points of embarkation. Its internal organization consisted of a Depot Branch, divided into Production Depot, Reserve Depot, and Camp and Cantonment Depot Sections; a Central Office Service Branch; and a Planning Branch, including an Engineering Section to determine building and space requirements, locate warehouses and depots and make layouts; and a Warehousing Methods Section, to determine methods of receiving, storing, assembling, packing, etc.

The Director of Storage, upon assuming office, took over the task of supervising Army storage in general. In the carrying out of this task he was in frequent consultation with the Director of Storage and Traffic. Between February 10 and September 6, 1918, his functions were purely supervisory, his chief duty being the development of a comprehensive storage program and general supervision of the construction involved.

The General Staff had, in January, 1918, established a basis for reserve supplies to be held for the use of the oversea forces and troops in training in the United States. The reserve for the oversea forces was to be an eight months' supply, of which three months was to be carried in France, one month at the Atlantic seaboard, one month at points immediately tributary to the seaboard, and two months at interior depots. The points at which reserves in the United States were to be carried were determined by the Director of Purchase, Storage and Traffic and approved by the General Staff. For troops in training in the United States provision was to be made for a six months' reserve stock of supplies, of which one month's supply was to be held at camps and cantonments, the balance at interior depots. Upon recommendation of the Director of Storage this provision was later changed to provide for 60 days' supply at camps in order to effect more economical distribution through the shipment of carload lots to camps and cantonments rather than smaller shipments which were necessary when only a 30 days' supply was carried at these points. A further modification of the program for reserves was made later by Supply Circular No. 69, July 25, 1918.

Storage facilities.—On the basis of the above reserves and the geographical distribution indicated, plans were developed for the construction of the necessary storage facilities. Estimates were prepared covering the cost of the construction work to be undertaken during the fiscal year 1918, and in the urgent deficiency act of March

28, 1918, and appropriation was secured for inland and port storage and shipping facilities, amounting to \$100,000,000, with an authorization for an additional \$50,000,000. Of the \$100,000,000 appropriation, approximately \$67,000,000 was required to make good a deficiency existing as of March 28. Of this deficiency \$26,000,000 had been incurred for construction under the program developed by the Director of Purchase, Storage and Traffic. The balance had been previously obligated by the Construction Division of the Army to cover the cost of projects originated by the several bureaus.

As a result of instructions issued to all bureau chiefs by the Director of Purchase, Storage and Traffic, requirements for storage and shipping facilities were to be submitted to the Director of Storage for investigation and approval prior to action being taken. Several of the bureaus at this time had on hand funds for the construction of storage facilities, available from previous appropriations. The Director of Storage was charged with the responsibility of determining the actual storage requirements for all bureaus and of determining the locations for additional facilities from the standpoints of production and economical distribution. Whenever one of the Army bureaus desired additional storage facilities a statement of its requirements, together with the requisite data showing the necessity and the desirability of locations, etc., was submitted to the Director of Storage, whose office investigated the need of the project, approved of the location and authorized the allotment of funds.

In considering the need of such storage the Director of Storage ascertained if the production program of the bureau desiring additional space had been approved by the Director of Purchases and Supplies. With this as a basis, and with knowledge gained from the Chief of Embarkation and the Director of Inland Traffic as to transportation facilities the Director of Storage was in a position to determine the amount of storage space actually necessary. Having approved of the project and allotted the funds, construction began under the supervision of the Construction Division of the Army. On completion of the project it was taken over and operated by the bureau concerned. Supervision over the process of construction was maintained through the Engineering Section of the Office of Director of Storage. This supervision did not amount to actual control of the project, however. It was found when supervision began that storage requirements of the bureaus were sometimes exaggerated, locations were poorly chosen, prices paid for real estate rentals were too high, and in some cases storage facilities and personnel were provided which were never used. It was the task of the Director of Storage to do away with such conditions.

It was apparent from the start that the storage requirements as submitted were theoretical rather than actual, and that the basis for the calculation of requirements was invariably unsound. The steadily increasing demand for supplies incident to the rapid increase in the size of the Army demonstrated the fact that the reserves called for by the General Staff program could not be accumulated for several years. Consequently no attempt was made to construct storage facilities conforming to the theoretical requirements of the Army program, and expenditures were authorized to provide only such facilities as would be necessary for the proper storage and

handling of the supplies which would be available in the immediate future. At no time did the storage facilities under control of the Army represent more than 50 per cent of the theoretical requirements. In this connection it is interesting to note an estimate of storage requirements prepared in August, 1918, upon the basis of requirements submitted by the several bureaus. The total estimate at this time was 153,301,480 square feet. The total amount of storage actually made available was 63,171,131 square feet. The accuracy of this statement, it must be understood, is only approximate. It does, however, show the relation of theoretical requirements to available storage space.

As has already been stated, the Army supply base at Port Newark, later operated by this branch, had been located, designed, and constructed prior to the establishment of the Office of the Director of Storage. This had been done by the Construction Division with the assistance of the Depot Board and the Storage Committee of the Council of National Defense. The storage facilities at Norfolk were also started prior to the creation of the Storage Branch. Work on the Port Newark base was well under way, but at Norfolk construction had been delayed owing to the fact that the facilities as planned were found to be undesirable from an operating point of view. Plans for both the warehouses and piers were revised and work resumed under the authority of the Director of Purchase, Storage and Traffic.

During the period from January 1 to July 1, 1918, construction work was begun on practically all the important storage projects undertaken by the Purchase, Storage and Traffic Division. Among the more important projects at interior points were:

- Permanent warehouses at Chicago.

- Completion of a permanent warehouse at St. Louis.

- Army reserve depots at Columbus, Ohio; South Schenectady, N. Y.; and New Cumberland, Pa.

- Additional warehouses at Jeffersonville, Ind.

- Additional warehouses on Governors Island.

- Philadelphia interior depot.

- Additional facilities at Pittsburgh.

- An increase in warehouse capacity at all camps and cantonments, amounting to practically 100 per cent.

- Cold-storage facilities at camps and cantonments.

- Engineer subdepots at camps and cantonments.

- Powder magazines at a large number of camps and cantonments.

In addition to the increased facilities through construction a large number of buildings were leased to afford necessary storage space in connection with existing depots.

At the seaboard the following projects were originated by the Director of Purchase, Storage and Traffic during this period:

- Army supply base, Boston, Mass.

- Army supply base, South Brooklyn, N. Y.

- Army supply base, Philadelphia, Pa.

- Army supply base, Charleston, S. C.

- Army supply base, New Orleans, La.

On account of the unusual engineering problems involved in the construction of these storage and shipping projects at the seaboard,

the Director of Purchase, Storage and Traffic was authorized to employ a staff of engineers to represent his office in supervisory capacity in connection with this construction work. While these engineers supervised the construction of the port projects, they were without authority so far as actual control over building operations was concerned.

The three Army reserve depots the construction of which was undertaken were for the joint use of the several bureaus. They were authorized in pursuance of the General Staff plan for the accumulation of reserves. The New Cumberland and South Schenectady sites were to be regarded as adjacent to seaboard and the Columbus site as inland. The New Cumberland and South Schenectady sites were selected because of the facility with which supplies could be sent from these points to ports of embarkation. None of the three was to be an issuing depot, although supplies stored in any of the three might be sent to other depots for issuance in the United States. The foregoing explains why these three depots were called Army reserve depots, although they were not designed to accommodate all reserves in the United States provided for in the General Staff program, as seaboard reserves were, of course, to be kept in various warehouses actually at the seaboard.

It was regarded by the Council of National Defense and others that the storage facilities included in the program of the Director of Storage as the three Army reserve depots would prove inadequate in the carrying out of the Army reserve program. The Director of Storage, however, took the position with the support of his superior that the limiting factor would be the production of supplies, and that the facilities planned would be adequate to store any reserves actually accumulated. With hostilities ceasing as they did in November, the decision not to furnish more ample facilities proved fortunate. If storage facilities had been provided on the full schedule called for by the reserve program, they would never have been fully utilized and a large number of expenditures would have been incurred in their construction.

These joint storehouses were operated under the supervision of the Director of Storage. Each warehouse was under the direction of an officer reporting to the Director of Storage. The operating system, however, amounted simply to the allotting to the various bureaus of the War Department of space in these depots. Each bureau maintained its own representative at the warehouse to keep the records of that bureau. The labor supply was pooled for the use of all bureaus. The Storage Division also provided all freight handling equipment and personnel at the Army reserve depots as well as at all port storage warehouses. The operating functions were carried on under the supervision of the Operating Section.

Prior to the establishment of control over storage facilities, a most chaotic condition had existed. Each of the bureaus had originated its own projects without regard to existing facilities or the possible creation of facilities for the joint use of several bureaus in the same locality. With the exception of the Ordnance Department, none of the bureaus had developed a uniform system of accounting for use in the depots, and it was an impossibility to determine accurately from any records in Washington the availability of supplies. To

this fact was largely due the unbalanced procurement program of many of the bureaus during the early months of 1918. The Ordnance Department had developed a system of accounting and reports which necessitated the employment of a personnel far in excess of any reasonable requirements, and on the basis of theoretical production had developed a storage program which would have entailed the expenditure of many millions of dollars which were saved to the Government through the establishment of central control. It is of interest to note that had the Ordnance Department carried out its program, the storage facilities constructed would never have been wholly utilized until some months after the signing of the armistice and the termination of shipments overseas. At this time buildings costing the Government many millions of dollars were being erected upon leased land, the leases containing no provision as to purchase, and land was being acquired for storage purposes, both by purchase and by lease, at prices in excess of actual value.

It can be seen from the foregoing that statistical control was an important phase of the storage problem, and arrangements were made whereby the Director of Storage received reports at certain intervals from each of the bureaus, giving the space occupied and unoccupied in their various warehouses, description of the purpose of the warehouse, and stating whether it was leased or owned by the Government. Whenever necessary the bureaus presented their estimated future needs for space over a considerable period of time.

Reference had already been made to the fact that approval was given for the creation of terminal storage facilities at Boston, South Brooklyn, Philadelphia, Charleston, and New Orleans. Plans for facilities at Baltimore were inaugurated but later abandoned. It was the idea of the Director of Purchase, Storage and Traffic that these facilities should be so located and constructed as to be available for commercial use in time of peace. These various projects were only partially completed at the time of the signing of the armistice. The Port Newark Terminal, however, was in actual operation for six months or more prior to the cessation of hostilities, and the Bush Terminal facilities in South Brooklyn, including storage warehouses, were leased and operated by the Government. The storage facilities at St. Louis were planned as a supply base for the Southwest, with possible operations on the Mexican border in view. The facilities at Chicago were intended to be for joint Army use, but were actually used for quartermaster purposes only. For the storage of explosives additional facilities were provided at Raritan, N. J.; Curtis Bay, Md.; and Pig Point, Va.; and authorized at Oldman, N. J. An explosives depot was also under construction at Charleston, adjacent to the Army supply base.

From the date of the creation of the Office of Director of Storage it was perceived that the most important function of the office was control of distribution, storage being merely an incident thereto. The saving in rail transportation through orderly distribution had apparently never received serious consideration prior to January, 1918, and the handling of supplies at the seaboard was in a state of almost hopeless confusion. Through lack of proper storage facilities at the ports, piers were universally used for storage, with the result that supplies were loaded on board ships not in accordance with the actual requirements of the American Expeditionary Forces,

but purely as a result of their accessibility. All of the ports used for overseas shipments were congested, and the records of supplies sent overseas were painfully inadequate and inaccurate. During the early days of overseas operations, the Engineer Corps was called upon to ship a tremendous tonnage of construction material, and to handle these shipments established depots at Kearney, N. J., and Norfolk, Va.

During the early months of 1918 it became apparent that the unsatisfactory condition existing at expeditionary ports was partially due to lack of proper coordination of the activities of the several bureau representatives at each port. The limited storage facilities available were not being utilized to capacity owing to the established practice of allotting certain definite warehouses to each of the bureaus, with the result that space controlled by one bureau was often unoccupied while other bureaus had a surplus of supplies which had either to be left in the cars in railroad yards or stored on the piers.

On March 8, 1918, the Director of Storage and Traffic submitted recommendations relative to a change in the method of the operation of storage facilities at the port of New York. On April 6, 1918, these recommendations were approved in principle and authority was granted the Director of Storage and Traffic to put them into effect with certain modifications. This action brought about the appointment of a storage officer for the port of embarkation, under the commanding general, to have general supervision over all storage space and over the different bureau representatives at the port, to coordinate their activities, and with authority to allot storage space at the Bush Terminal and Port Newark Terminal from time to time as needed. The bureau representatives were to retain the responsibility for supplies or storage and for their assembly for overseas shipments. This arrangement enabled the organization of the Bush Terminal to be preserved, but gave a foundation for a future system to be developed under the Director of Storage and Traffic along the lines dictated by experience.

The next development in the operations at expeditionary ports took place as the result of General Order No. 54, War Department, June 3, 1918, which established definitely the status of the port storage officer and the bureau representatives, who were thereafter known as port supply officers. General Order No. 54, as subsequently amended by Supply Circular No. 94, September 27, 1918, placed upon the port storage officer responsibility for the authority over storage and distribution of supplies of all departments, bureaus, corps, and other agencies of the War Department and the operation of all storage facilities.

It is to be noted that the tendency in the control of supplies at the ports had proceeded steadily in the direction of unified control and responsibility. The results following the consolidation of all storage and distribution activities at the port were a complete justification of the policy recommended by the Director of Storage and Traffic in March, 1918.

After the development of the construction program to provide necessary facilities, the problem of distribution and uniform methods of stock keeping and accounting occupied the major portion of the time of the Director of Storage.

Beginning of consolidation of storage.—The combination of the offices of Director of Storage and Traffic and Acting Quartermaster General which had been effected in December, 1917, and continued in April, 1918, when the former became Director of Purchase, Storage, and Traffic, lasted until May 9, 1918, when, by General Orders, No. 46, a new Acting Quartermaster General was appointed. For several months subsequent to this date there was in all formality an absolute separation between the two organizations, and the office of the Quartermaster General bore the same relation to the Purchase, Storage and Traffic Division as did any other bureau of the Army.

On August 27, 1918, however, the Office of the Quartermaster General was definitely subordinated to that of the Director of Purchase, Storage and Traffic (this important development is discussed more fully at a later place). Supply Circular No. 80 of that date set forth the organization of the division and provided that the Quartermaster General of the Army should report to the Director of Purchase, Storage and Traffic. This order also stated that "the Quartermaster Department, in addition to its other duties, shall have responsibility for and authority over storage, distribution, and issue within the United States of all supplies from the Army." The particular effect of the latter provision was to place the Director of Storage under the supervision of the Acting Quartermaster General, and this was officially accomplished on September 6, 1918, by Supply Circular No. 85. On September 12, 1918, by Supply Circular No. 91, this arrangement was slightly changed by the provision that the Acting Quartermaster General as Director of Purchase and Storage should have responsibility for and authority over storage, distribution, and issue of all supplies, and that, reporting to the Director of Purchase and Storage should be a Director of Purchase and a Director of Storage.

The significance of the foregoing changes is plain. They were made with a view to transforming the existing supervisory control of storage into actual executive control, and the binding of component parts into a complete system. Consolidation of the important supply functions of the various bureaus of the Army was soon to begin. The necessity for such consolidation had been discussed in the memorandum of July 18, 1918. In regard to storage it had been said:

This is a highly specialized task and should be dealt with by storage experts. Storage is rendered necessary by fluctuation in procurement and transportation. Procurement and transportation are integral problems, to be dealt with by separate integral systems. Therefore, the storage system of any army should be one system, carefully designed with reference to the systems of procurement and transportation, physical as well as organizational.

Articles fall into classification for storage according to their nature, as breakable, inflammable, explosive, perishable, etc., and not into artificial classifications according to the use to which they are to be put after they come out of storage. The regulation of distribution with full reference to centers of production and to facilities for transportation and storage is necessary in order to obtain bulk shipments, to void duplicated small shipments, and to accelerate supply. Such regulation of distribution can be obtained only by consolidation of storage.

It is axiomatic that distribution, i. e., the breaking of bulk, should be as near as possible to the point of use and as far as possible from the source of production. The maintenance of numerous storage systems breaks bulk at the very source of production and therefore violates the axiom.

Property and stores accounting ought to be uniform throughout the Army.

Conclusion: Storage ought to be consolidated in one central system responsible for the storage of all supplies. Such is the case in all great business systems and in the English and possibly other armies.

The first step in the realization of this conclusion was the consolidation of the office of the Quartermaster General with that of the Director of Purchase and Storage, which brought under the central supervisory authority 80 per cent of the procurement and storage operations of the Army.

To take care of these increased activities, a plan of organization for the office of the Director of Storage, after one unsuccessful attempt, was worked out, stated in Purchase and Storage Notice No. 19, dated October 28 and made effective November 1, 1918. The office was to consist of the following divisions: Storage Administration Division, Domestic Distribution Division, Domestic Operations Division, Overseas Distribution Division, Port Operations Division, Salvage Division. This was the form of organization as found at the conclusion of the war.

Between the time when Quartermaster storage was taken over and the signing of the armistice the storage functions of three other bureaus were transferred to the General Staff supervisory authority. By Supply Circular No. 99, October 22, 1918, the entire Depot Department of the General Engineer Depot was transferred to the Office of the Director of Purchase and Storage, as well as so much of the Office of the Director General of Military Railways as was engaged in the work of storage and distribution of railway equipment and material. By Supply Circular No. 102, October 24, 1918, the entire Supply Branch and Supply Depots Branch of the Finance and Supply Division of the Office of the Surgeon General was transferred to the Office of the Director of Purchase and Storage. By Supply Circular No. 103, October 23, 1918, the entire Supply Division of the Signal Corps was also transferred. The effect of these three acts, while they made certain reservations in regard to the procurement function, was to place the storage function under the control of the Director of Purchase and Storage to be operated directly by the Director of Storage.

This was as far as consolidation had gone when the armistice was signed. The developments since that time will be taken up in their proper place later. It is sufficient to say here that consolidation was continued to some extent but not to cover the entire field.

In the taking over of the storage, distribution, and issue functions of the several bureaus referred to above, the various organizations were simply grafted onto the existing Quartermaster organization, which was from time to time subjected to minor changes to meet the new requirements. The amalgamation was of necessity a slow process, as nothing could be done which might interrupt the flow of supplies to the troops in the field. At the time of the general reorganization of September 6, it was the plan to consolidate under the Director of Purchase and Storage the procurement of all nontechnical Army supplies. This was not fully carried out. Thus it was decided, as will be seen later, to leave in the Ordnance Department the storage of artillery and parts and ammunition and components.

The history of storage brings out in clear relief the same undesirable effects of the bureau system of supply from the standpoint of the storage problems involved as have been observed in connection with other parts of the supply task, and brings out also in strong contrast the achievements of the Purchase, Storage and Traffic Di-

vision in the handling of those problems as a supervising and coordinating agency.

THE FINANCE DEPARTMENT.

Finance is not so much a special field reserved for the service of the supply system as it is an agency auxiliary to all activities of the Army. Nevertheless it affects supply very closely, and it was natural, therefore, that centralization of the supply organization could not proceed very far without involving the field of finance, and that the centralized control of financial activities should be undertaken by and in connection with the coordinating agency.

It has already been seen that early attempts at standardization of the financial transactions of the bureaus were conducted under the auspices of the Finance Section which had been set up as part of the machinery of the Purchase and Supply Branch. The authority of this section, had, however, been supervisory only in the most general way.

The beginnings of the present Finance Department date from the issuance of Supply Circular No. 80, of August 27, 1918, which reorganized the Purchase, Storage and Traffic Division. It abolished the Finance Section and set up in its place an Accounts Department coordinate with the other main departments of the division. The duties of the new department were stated to include responsibility for and authority over disbursements, fiscal accounting, preparation of estimates, and reports of accounts.

In the establishment of the Accounts Department it was intended to create an operating organization which would eventually take over the activities of the finance sections of the supply bureaus. This was clearly indicated in the memorandum of July 18, 1918, which had served as the basis for the reorganization. It had been pointed out in that memorandum that the powers of the Accounts Department up to that time had been in the main supervisory only; that supervision over several agencies tended to envelop and duplicate executive control, to create conflicts of authority, and to divide responsibility, especially where the supervisory organization had administrative powers; and that supervision was naturally much weaker than central responsibility and executive control. So far as finances was concerned, it was urged that:

Fiscal accounting is a special, self-contained function. Unless bookkeeping methods are uniform there can be no system in accounts. The War Department is gradually moving toward a budgetary system and should accelerate the movement. There is no sound reason for independent accounting systems and there is every reason against them. Ideal organization would comprise one compact, unified division, responsible for supply, with subdivisions for purchase, storage, transportation, finance, and facilities.

The duties of the finance subdivision were outlined as follows:

1. Supervision and control of fiscal accounting methods and organization for entire War Department.
2. Preparation in budget form of estimates for entire War Department.
3. Reports at stated intervals of accounts for entire War Department.

General Orders, No. 80, War Department, August 26, 1918, which effected reorganization of the General Staff, charged the Purchase, Storage and Traffic Division among other things with "the supervision and coordination of all fiscal accounting systems and appro-

priations, estimation, and requirements and other financial matters relating to the purchase of the munition and all other supplies," which was practically the same language as that used in General Orders, No. 14, which had been the original authority for the creation of the Finance Section and apparently limited the Accounts Department to "supervision and coordination." The intended expansion of the department into an operating organization did not take place at once. Attention was devoted principally to supervising the preparation of appropriation estimates and to issuing the daily financial report. In addition, the department kept in touch with the activities of the finance sections in the supply bureaus and to a certain extent helped to guide them, but no direct action toward bringing about standardization of methods or consolidation of the sections was undertaken.

The Accounts Department accomplished little during the brief period of its existence and its activities gradually dwindled to insignificance. On October 11, 1918, by Supply Circular No. 98, it was abolished entirely. In its place, however, there was set up, by the same order, a new Finance Department with much greater authority and with powers of an actual operating organization. The Finance Department was to be headed by a Director of Finance, charged with responsibility for and authority over the preparation of estimates, disbursements, money accounts, property accounts, finance reports, and pay and mileage of the Army. The Director of Finance was further empowered to issue directions as to the order of consolidation of the activities placed under his jurisdiction, together with such other instructions, regulations and orders as might be necessary to carry out these powers.

It will be noted that the Director of Finance was thus given authority not only over the entire financial activity of the War Department in general terms, but power explicitly stated to bring about in his own office a complete consolidation of these activities. His authority was not limited to the financial transactions of the supply bureaus, but included also the activities, personnel and equipment of the finance sections of the General Staff and other separate services of the Army.

The consolidation of the finance activities of the War Department was the logical result of the steadily increasing consolidation of procurement under the Director of Purchase. It was made evident that the consolidation of finance was expected to keep pace with the consolidation of procurement, and in practice this was the general policy followed. Lack of quarters, however, made it impossible to bring about a physical consolidation of the finance sections of the various bureaus as rapidly as they were placed under the jurisdiction of the Director of Finance, and this handicap made it impracticable to bring about their absorption into a single homogeneous unit as rapidly as was desired.

On October 16, 1918, Finance Circular No. 1 prescribed the organization of the office of the Director of Finance. Under the Director of Finance and an Assistant Director of Finance acting as executive officer there were to be four Assistant Directors of Finance, each in

charge of a group of activities. These four groups were in turn subdivided into divisions as follows:

Administration—

Administration Division.

Personnel Division.

Financial Control—

Estimates Division.

Apportionments and Requirements Division.

Credits Division.

Accounts—

Money Accounts Division.

Property Accounts Division.

Disbursements—

Central Disbursing Division.

Pay of the Army Division.

These divisions were further subdivided into branches on the basis of the corps and departments, the business of which they were to handle. This arrangement made it possible to consolidate similar activities of the various corps into a single division and at the same time to allow these activities to be continued by the same men and under approximately the same methods of procedure as formerly.

The transfer of the finance activities of the bureaus began on October 21, 1918, when, coincident with the transfer of its procurement and storage functions to the Office of the Director of Purchase and Storage, the finance organization of the Quartermaster Corps was taken over by the Director of Finance.

It was a significant fact that the development of the Finance Department had much the same history as the development of the Office of the Director of Storage. In both cases the new organization was, to a large extent, built around the organization previously existing in the Quartermaster Corps. In the Finance Department, for example, not only were the financial activities of the Quartermaster Corps the first to be taken over, but the department was organized along much the same lines as the Finance and Accounts Division and Central Disbursing Division of the Quartermaster Corps, and Quartermaster Corps officers were to a large extent placed in charge of the various divisions. As the financial activities of the other corps were taken over, they naturally were fitted into the organization already existing or, in other words, were virtually absorbed by what had been the Quartermaster Corps, now operating under a different name.

On October 22, 1918, Supply Circular No. 99 transferred certain procurement and storage functions of the Corps of Engineers to the Office of the Director of Purchase and Storage and in accordance with the general policy of having the consolidation of finance keep pace with the consolidation of procurement, this circular also transferred to the Office of the Director of Finance all of the work of finance and accounting involved in the procurement of Engineer supplies, including both those that were transferred to the Director of Purchase and Storage and those that remained with the Corps of Engineers. With the transfer of these activities went the personnel, equipment, and records with which they were concerned.

The transfer of the financial activities of the Corps of Engineers was followed almost immediately by the transfer of the same activi-

ties of the Signal Corps by Supply Circular No. 103 of October 25, 1918; and by the taking over, on October 24, 1918, by Supply Circular No. 102, of all of the activities in the office of the Surgeon General pertaining to finance and accounting.

On November 6, 1918, Supply Circular No. 110 transferred to the office of the Director of Finance the work of finance and accounting involved in connection with Quartermaster supplies placed under the Director of Purchase and Storage and also all finance activities pertaining to the procurement of such supplies as remained with the Quartermaster Corps. No changes were necessary as a result of this action, as the entire finance organization of the Quartermaster Corps had already been taken over.

No further transfers were made before the signing of the armistice. Some further consolidation took place but this will be taken up in its proper place later.

The financial activities of the War Department outside of Washington were organized under the Director of Finance along the same lines as the field organization adopted by the Director of Purchase and Storage. Purchase and Storage Notice No. 21, of October 28, 1918, established the zone system of supply operation. Under this system the depot quartermaster in each of the general procurement zones was appointed as zone supply officer and, with certain modifications was charged with authority over and responsibility for supply activities within the zone under his jurisdiction.

Purchase and Storage Notice No. 21 stated that the Director of Finance should designate an officer as zone finance officer for each of the general procurement zones. The zone finance officer was to be under the general supervision of the zone supply officer, but on technical matters was to report to the Director of Finance, and was to be charged with such finance administration, including disbursements, money accountability, and property accountability within the zone as might be authorized and directed by the Director of Finance. Under this arrangement there were to be 13 zone finance officers in the United States in charge of financial activities of the War Department outside of Washington and acting in cooperation with the zone supply officers in charge of supply activities in the field. This system was not actually put into effect, however, until after the signing of the armistice and will be taken up later in the discussion of that period.

The Finance Department experienced but a short period of existence before hostilities ceased, and its principal activities have been carried on since that time in completing plans inaugurated just before the close of the war. It may be said in general, however, that the aim of the Finance Department from the beginning was the same as that of the former Finance Section of the Purchase and Supply Branch—that is, to bring about, under the direction of the Purchase, Storage and Traffic Division, a consolidation of the financial activities of the entire War Department. The method adopted to accomplish this end, however, was quite different from that followed by the Finance Section. The latter planned first of all to bring about a standardization of forms and methods in the finance sections of the various bureaus, so that whenever their anticipated consolidation should be regarded as desirable they would all be doing the same thing in the same way, and could therefore be brought to-

gether readily into one harmonious whole. The Finance Department, on the other hand, feeling that standardization of the diverse methods already in use was difficult to effect in the middle of a fiscal year, and particularly while the finance sections of the various bureaus remained under the administrative control of the bureau chiefs, adopted the opposite policy of bringing about consolidation first and standardization later. It, of course, recognized the fact that consolidation under these conditions would not result immediately in a unified organization, but felt that in the long run the desired end would be reached more quickly, more easily, and more effectively by bringing the various finance sections together as soon as possible and giving them an opportunity to become thoroughly familiar with each others' ways before an attempt was made to fit them all into the same mold.

The form of organization adopted by the Finance Department—principally along functional and secondarily along organizational lines—was well adapted to this general scheme of development. Under this arrangement the various finance organizations transferred to the Office of the Director of Finance were not taken over intact, but their activities and personnel were split up along functional lines and assigned to the appropriate divisions of the Finance Department. At the same time, no attempt was made to bring about an immediate consolidation of these activities within the various divisions, the part of the bureau assigned to the divisions being made a separate branch and allowed for the time being to continue to handle its work in the way in which it had been accustomed. The next step toward unification was obviously to do away with the independence of the various branches in the same division by reorganizing them along functional lines. This step was not taken until later.

The action taken in the centralization of finance took a somewhat different form than that which was followed in regard to other parts of the supply system. It contemplated the creation of a completely separate organization for the performance of a highly specialized service for all departments and corps of the Army. The faults which led to its establishment and the benefits resulting from its operations as a single agency were identical with these which were found in regard to all other phases of the bureau system of supply.

REORGANIZATION OF AUGUST, 1918.

Reference has been made in various places in the preceding pages to the reorganization of the Purchase, Storage and Traffic Division which took place in the latter part of August, 1918, and the effects of that reorganization upon the principal parts of the supply supervisory agencies have been included in the accounts which have been given of these agencies in order not unduly to interrupt the narrative. It now becomes appropriate to summarize these changes and to set forth the formal organization which was effected at this time.

The reorganization extended beyond the limits of the Purchase, Storage and Traffic Division and extended to the whole General Staff, amounting to a restatement and clarification of the position of the General Staff in relation to the Military Establishment. The changes which took place are set forth in General Orders, No. 80,

War Department, August 28, 1918, and Supply Bulletin No. 29, November 7, 1918.

GENERAL PLAN OF ORGANIZATION.

Coordinating authority in so far as it related to the field of supply was vested in the Purchase, Storage and Traffic Division of the General Staff, in charge of the Director of Purchase, Storage and Traffic, who was designated as Assistant Chief of Staff. He was given cognizance and control of the following:

(a) The supervision and direction of all requirements and the procurement and production activities, including real estate, of the several bureaus, corps, and other agencies of the War Department; the coordination and correlation of the requirements and the procurements and production activities of the several bureaus, corps, and other agencies of the War Department; the maintenance of an estimate of the military resources of the Nation respecting material of every description; the representation of the Army in all arrangements for coordinating the requirements, procurement, and production activities in the several bureaus, corps, and other agencies of the War Department, with other agencies of the Government and with the Allies, including replacements of material pertaining to the Army with the latter; the determination of purchasing and manufacturing priorities between the several bureaus, corps, and agencies with the War Department, and in relation to other agencies of the Government; the determination of priorities to be afforded to contractors for supplies in the matter of the shortage of fuel, power, and raw material; the supervision and coordination of all fiscal accounting systems and appropriations, estimates and requirements, and other financial matters relating to the purchase of the munition and all other supplies; the supervision of the computation of the requirements and rates of production necessary to provide types and quantity of equipment as determined by the Operations Division. Statements of the type and quantities of equipment and supplies for all branches of the Army shall be furnished the several bureaus by the Operations Division. It shall then be the duty of the Supply Bureau, under the supervision of the Director of Purchase, Storage and Traffic to compute the requirements and rates of production necessary to provide equipment and supplies, in the quantities, at the places, and within the time determined by the Operations Division.

(b) The storing and warehousing of property for all departments, bureaus, and corps of the Army, both at interior points and at the seaboard, and the operation of all storage facilities provided for the joint use of all bureaus of the Army.

(c) All that pertains to the routing, inland and coastwise, of troops and property of the War Department, by motor, rail, or ship, and the conduct of all negotiations with inland carriers with respect to questions affecting such transportation; the movement of all property of the War Department to prevent congestion and to obtain preferential movements thereof; coordination of rail movements required in the handling of supplies destined for shipment overseas with shipments by the Allies.

(d) The transportation of troops and supplies overseas, embarkation and oversea service relating to the Army program, including the employment of all Army transports, harbor floating equipment and new construction in connection therewith, except the construction and control of floating equipment operated by the Corps of Engineers for river, harbor, and fortification work, and the control of the Army mine-planter service; such commercial shipping as may be used to supplement that service, including all arrangements with the Navy Department for convoy service; all primary ports of embarkation, expeditionary ports, and concentration camps connected therewith; courier service between the War Department and General Headquarters, American Expeditionary Forces.

(e) Direct correspondence between the Director of Purchase, Storage and Traffic or the chief of embarkation and the commanding officers of ports of embarkation is authorized. Copies of all requisitions, requests, and information of every character received from the commanding generals of forces operating overseas, or their subordinates, which bear upon reenforcements or removals of supplies will be transmitted to the Director of Purchase, Storage and Traffic.

Supply Bulletin No. 29, issued on November 7, 1918, contains a complete synopsis of all phases of the reorganization of the supply system of the Army. Its résumé of the evils attendant upon the old bureau system has already been set forth in the preceding pages. Its description of the new organization which was set up makes reference to several supply circulars (especially Supply Circular No. 30 of August 27, 1918, and Supply Circular No. 86 of September 5, 1918) and contains a set of charts which show the framework after it had been fully established.

In regard to the initial organization of the Purchase, Storage and Traffic Service it was said:

It is true that an organization of the General Staff had been set up to coordinate the work of the bureaus, and that it had accomplished some good in this field. Its powers were, in the main, supervisory only, and, as has been pointed out, the organization did not lend itself readily to supervision. Furthermore, supervision tends to envelop and duplicate executive control and to create conflict of authority and divided responsibility, especially where the supervisory organization has administrative powers. It is naturally much weaker than single responsibility and executive control.

The nature and powers of the new organization were established in the following language:

At the head of the organization is a Director of Purchase, Storage and Traffic, whose function is executive and not supervisory. He receives the Army program from another division of the General Staff, and his is the responsibility for the computation of the requirements to meet that program and the filling of these requirements. He is in command of the supply organization and relieves the Chief of Staff from all detail of and responsibility for supply.

The fundamental idea of this reorganization is first, the consolidation in one department of the purchase of all standard articles of merchandise, leaving in the bureaus the purchase, production, and inspection of highly technical material, such as ordnance, aircraft, etc., and second, the storage, distribution, and issue within the United States, and their storage prior to shipment abroad, of all War Department supplies, whether standard or special (including those excepted from procurement).

Based on these principles, there was set up an organization consisting of a group of supervising and directing units and a group of operating units, which constituted the Purchase, Storage and Traffic Division as it stood at the signing of the armistice. This organization outline was as follows:

Supervising units—

- Statistics and Requirements Branch.
- External Relations Branch.
- Purchase Branch.
- Production Branch.
- Executive Branch.
- Inspection Branch.
- Research Branch.

Operating departments—

- Embarkation Service.
- Inland Traffic Service.
- Office of Director of Purchase and Storage and Acting Quartermaster General.
- Facilities Department.
- Finance Department.
- Primary Ports of Embarkation.

The supervising units.—It will be noted that the former Purchase and Supply Branch had disappeared, its various component units finding a new arrangement.

Of the various branches comprised within the supervising units, four have already been mentioned, namely the Statistics and Requirements Branch, the External Relations Branch, the Purchase Branch and the Production Branch. The Statistics and Requirements Branch took over the functions of the former Supplies Accounting Section, Purchase and Supply Branch, becoming charged with general responsibility in statistical matters. It also took over from the former Supply Program Section the supervising and coordinating of requirements calculations in the supply bureaus. The External Relations Branch took over the functions of the former Supply Program Section which were concerned with relationships with the War Industries Board, including price fixing, clearance, and priorities. The Purchase Branch took over most, though not all, of the personnel and duties of the former Purchase Section. The Production Branch was identical with the former Production Section except in unit designation.

The Executive Branch was set up to maintain general oversight of the developing organization as well as to issue orders and instructions affecting organization.

The work of the new Inspection Branch consisted of two parts; it exercised a general supervision over the inspection of all army supplies, and in particular cases where difficulties arose on matters of inspection the solution was furnished by the Inspection Branch. A comprehensive study of the whole problem of army inspection was made by this branch and recommendations in the direction of centralizing in one organization inspection functions for all army supplies, were offered, but due to the termination of hostilities nothing was actually done toward putting into effect the recommendations which were directly in line with the principle underlying the reorganization of the supply service.

The Research Branch under the name of the Bureau of Industrial Research had been developed in close association with the Director of Purchase, Storage and Traffic. Its general task was the saving of packing and crating, the more efficient baling of clothes and other compressible supplies, etc.

The operating departments.—In addition to the supervising units there were the regular operating departments, all reporting to the Director of Purchase, Storage and Traffic. The history of the Embarkation Service, the Inland Traffic Service, the Finance Department and the Facilities Department has already been traced. Coordinate with the other departments were placed the Primary Ports of Embarkation (New York and Newport News), as operating organizations reporting to the Director of Purchase, Storage and Traffic. Some account of these ports of embarkation has been given in connection with the Embarkation Service.

The most striking and important development of the reorganization was the establishment of definite machinery for the central procurement of standard supplies. In doing this two alternatives were offered, first, to create a new organization, or second, to reorganize and adapt the office of the Quartermaster General to the present plan,

to use it as the central office for Purchase and Storage, and to bring commodity sections from other bureaus over to the commodity sections of the Quartermaster Department, where most of them already were. The second alternative was adopted and the office of the Quartermaster General was reorganized to meet the needs of the Director of Purchase and Storage. An outline of this adaptation now becomes necessary to complete the survey of the development under the Purchase, Storage and Traffic Division during the war.

DEVELOPMENT OF OFFICE OF DIRECTOR OF PURCHASE AND STORAGE.

On October 21, 1918, the Quartermaster Corps and the Office of the Director of Purchase and Storage became one and the same organization and the consolidation brought together the greater part of the procurement and storage functions of the supply system in the United States. The new arrangement functioned but a short time before the signing of the armistice and the chief interest in the process lies in the evolution which had taken place within the Quartermaster Corps which made it possible by minor adaptations to make that corps the operating agency in procurement. The development of storage control out of the Quartermaster Corps at the beginning of 1918 and its reunion with it upon the setting up of the Office of Director of Purchase and Storage and Acting Quartermaster General has already been described.

Evolution of the Quartermaster Corps during the war.—The Quartermaster Corps at the outbreak of war most nearly constituted the supply agency of the War Department in so far as any bureau might be said in any degree to approximate a single agency. Its primary function was that of furnishing to the army the clothing, the food, and most of its equipment except ordnance. This involved the purchase and distribution of a multitude of subsistence and equipment items, vehicles and harness, hardware and metals, fuel and forage, remounts, the operation of laundries and repair shops, etc., and a great amount of financial business, including property accountability and pay of the Army. In addition to these duties, however, the Quartermaster Corps was charged with a number of other functions which added greatly to its burdens. Among these was the construction and repair of all buildings erected or maintained by the Army, the handling of the movements of troops and property by land, and the operation of the Army Transport Service by sea, and the business of motor transportation which had assumed large proportions in the operations in Mexico in 1916 and which grew to still greater proportions in the present war.

At the outbreak of war the Quartermaster Corps found itself in the same situation as all the other purchasing bureaus of the Army but its position was particularly critical because it was charged with the initial task of providing the immediate needs of the new Army. Its problem of supply was essentially the same as that of the other bureaus but at the beginning more highly intensified. In order to work out a plan by which supplies should always be available when needed, both in this country and abroad, it was necessary to consider carefully the amount of time required for transportation of supplies from manufacturers to depots, from depots to camps, and from depots to troops abroad. An even more important problem was that

of determining the time required to obtain supplies after orders had been placed with factories, and oftentimes difficulties necessarily resulted because of an underestimation of this time or because of delinquencies in factories themselves. At the beginning of the war it was peculiarly true that factories in certain parts of the country were given contracts for much more than could actually be produced in their plants.

The proper allocation of contracts, the determination in advance of the allocation of contracts as to whether raw materials were available for the actual manufacture, were matters which had to be worked out in great detail. For example, the problem with respect to woolen clothing was not merely the problem of the purchase of a supply already existing; it was a problem of determining first, how many uniforms were needed and when and where needed; second, of making sure that the wool was available for the manufacture of such uniforms—and this constituted one of the most serious problems; third, the placing of contracts for the obtaining of such uniforms; and fourth, the delivery of the uniforms to the places where they were actually needed. If any one of these items caused difficulty, the whole supply program was affected. The problem of obtaining, manufacturing, and supplying quartermaster supplies for the Army at home and abroad was therefore tied up with the whole system of national industry and of inland and ocean transportation.

At the beginning of the war the Quartermaster Corps' purchasing system was largely decentralized, each depot buying more or less independently and supplying posts, forts, and other military establishments in accordance with a published plan. This decentralized system of purchasing necessarily had to be controlled when the Government came to use substantially all of the manufacturing resources of the country.

In the early months of the war, some effort to meet this situation was made, as has been seen, through the Council of National Defense. The Secretary of War approved a certain list of articles which were to be purchased exclusively through the Council of National Defense. This list was prepared by the Committee on Supplies of the council and included woollens, cotton, leather, rubber goods, etc. All purchasing quartermasters were notified that they were not to place any orders for any of these articles excepting in case of emergency, where they were required for immediate delivery. Whenever articles on this list were required for the Army, a letter was written to the Council of National Defense, stating the quantity of each required and requesting that the depot quartermaster at Philadelphia (where the purchase of all these articles was largely focussed) be advised as to where these articles might be obtained, price, and rates of deliveries. The committee on supplies then proceeded to obtain quotations, either by submission of formal bids or by informal inquiries. The recommendations of the committee on supplies were then forwarded to the depot quartermaster at Philadelphia, who placed orders direct with the contractor. It was not until this had been done that copies of such orders were forwarded to the office of the Quartermaster General.

For several of the early months of the war the Quartermaster Corps, in regard to important groups of supplies, was thus subjected

to the domination of the Council of National Defense, through its Committee on Supplies. While the plan undoubtedly held some advantages in that the services of the experts of the Committee of Supplies were brought to bear upon the procurement of vital war materials, nevertheless it secured these advantages at the expense of the Quartermaster Corps and had a demoralizing effect upon that organization. When the Committee on Supplies of the Council of National Defense went out of existence, about the beginning of 1918, the work this committee had performed was turned back to the Quartermaster Corps and it was arranged that coordination and supervision of purchase should be effected by the agencies within the War Department whose creation and development have already been described.

From January on the history of the Quartermaster Corps was an evolution toward a purchase and distribution service, which made it possible, when consolidation with Purchase and Storage took place, to effect the change with a minimum of disruption of existing arrangements. There were two phases to this evolution. One was the splitting off from the Quartermaster Corps of services which were foreign to the purchase function; the other was the consolidation of the procurement of a large number of articles of supply within the corps and the adjustment of its internal machinery to take care of the process.

Separation of services from Quartermaster Corps.—In order to relieve the Quartermaster Corps of a number of functions which were alien to the procurement task and which grew to such large proportions with the existence of war as to seriously embarrass any single organization charged with their control, the services of construction and repair, land and water transportation, motor transportation, and finally finance were removed from its jurisdiction. The circumstances connected with these separations have been discussed already in connection with the accounts of the various services in which they resulted.

With the beginning of war the problem of construction became one of very great importance, and required necessarily much more attention than could be given to it under the previous organization of the Quartermaster Corps. On May 16, 1917, the Chief of Staff and the Secretary of War approved a recommendation that an officer be charged with the exclusive work of cantonment construction, and on May 17 the Quartermaster General detailed an Officer in Charge of Cantonment Construction, and recommended that while in charge of this work he be given special authority to report directly to the Secretary of War, to communicate directly with department and division commanders by order of the Secretary of War, and to issue travel orders. These recommendations were approved, and the work of construction, while still subordinate to the Quartermaster Corps as regards appropriations and personnel, became a substantially independent organization which came to be known as the Cantonment Division. On October 10, 1917, the Construction and Repair Division of the Office of the Quartermaster General was abolished, and all of its duties transferred to the Cantonment Division. Under date of February 12, 1918, the Cantonment Division was attached to the Operations Division of the Office of the Chief of Staff, and on March

13, 1918, by order of the Secretary of War, the name of the division was changed to the Construction Division. The work of construction ceased to be a quartermaster function, and was set up as an independent war activity.

The organization of a general supervision with respect to purchase, storage and traffic naturally required some change in the organization and functions of the Quartermaster Corps. The function of purchase and the function of storage necessarily remained as functions to be performed by the Quartermaster Corps with respect to quartermaster supplies. It was equally necessary that the functions of railroad and water transportation should be taken over by the central agency substantially in their entirety, and this was actually what occurred. The Inland Traffic Service succeeded the Land Transportation Branch of the Transportation Division of the Quartermaster Corps and on April 22, 1918, the Water Transport Branch was transferred to the Embarkation Service, and within the Quartermaster Corps the Transportation Division was abolished on June 15, 1918, and its remaining functions reassigned to other divisions.

With the development of motor transport needs, a separate motor transport division was created in the Quartermaster Corps; and by General Orders, No. 38, War Department, April 18, 1918, the Motor Transport Service as a part of the Quartermaster Corps was definitely organized under an assistant to the Quartermaster General. It was made the function of the Motor Transport Service so organized to have supervision over "all motor-propelled vehicles except tanks, caterpillars and other artillery tractors." The purchase of non-specialized motor equipment was thus consolidated into the hands of the Motor Transport Service, and in addition the Ordnance Department was instructed to confer with the Chief of the Motor Transport Service in the purchasing of special types of vehicles. The Motor Transport Service thus became a purchasing and controlling agency for the whole War Department and ceased to be a definitely Quartermaster Corps activity in the sense of being limited to the service of that corps. On August 15, 1918, the separation was made complete by General Orders, No. 75, War Department, 1918, which constituted an independent Motor Transport Corps.

The removal of finance functions from the Quartermaster Corps was the last separation to take place, near the end of the war, and has already been sufficiently described in connection with the Finance Department.

Consolidation of procurement in the Quartermaster Corps.—The second phase of the evolution of the Quartermaster Corps into a purchase bureau began with the consolidation of procurement which brought the purchase of many of the items of supply of the Army under its jurisdiction.

By General Orders, No. 8, War Department, 1918 (January 19, 1918), General Orders, No. 23, War Department, 1918 (March 4, 1918), and General Orders, No. 53, War Department, 1918 (May 27, 1918), the Quartermaster Corps became the War Department agency for procuring and distributing fuel and oil for the Army, except for those lubricants which were used for aircraft and aircraft guns and which required governmental assistance in production or manufacture. When the food and fuel control law was passed, on

August 10, 1917, in response to the urgent necessity for a central supervision over fuel for military uses, for Army, manufacture, and for private use, the Quartermaster Corps activities with respect to fuel were thereafter conducted through and in close cooperation with the Fuel Administration. This relationship was more closely cemented by the consolidation of all fuel and oil purchases in the Quartermaster Corps.

Under the provisions of the same law above referred to, the Food Administration was created, and in the purchase of food for the Army, the Quartermaster Corps acted in close cooperation with that organization. The Quartermaster Corps also cooperated closely with the Food Administration in the purchase of forage.

With the organization of the Purchase, Storage and Traffic Division, a more definite activity began with respect to supervision over consolidated Army purchasing. On May 8, 1918, the Purchase and Supply Branch began the issuance of a series of supply circulars whose purpose was the consolidation of procurement and a consolidated supervision over the procurement of War Department supplies. Under these supply circulars the general policy was to consolidate all Army purchasing into the hands of a particular supply bureau, where that supply bureau was already purchasing the major part of a particular article of supply for the Army.

The general procedure to be followed under the new system was laid down in Supply Circular No. 2, May 8, 1918, under the provisions of which each supply bureau was to continue to be responsible for the determination of requirements, designs, and specifications, and for the issue to the service of the same articles as previously, these articles being delivered to it by the procuring bureau for such issue. The other supply bureaus were to make known their requirements to the procuring bureau by means of a procurement requisition on the latter, at the same time transferring to it the estimated amount of funds required for the purpose. In accordance with the procurement requisition, the procuring bureau was to be solely responsible for making purchases, following production, conducting inspection, and making acceptance of and payment for the articles placed in its charge.

The process of consolidation of procurement began at once, and was effected by groups of articles. The first consolidation to effect the Quartermaster Corps became operative June 3, 1918, and other consolidations were put into operation successively on June 10, July 10, August 1, 10, and 31, September 6, and 17, and October 15, 1918. As a result of this process there was consolidated in the Quartermaster Corps the purchase of a great number and variety of articles which made it the most important purchasing agency of the Army. The list included the following items:

Hand-drawn, animal-drawn, motor-propelled, and wooden vehicles, automotive trucks and fire apparatus, and trailers.

Automobile and pneumatic tires.

Paper and paper bags and cartons.

Bedsteads, bunks and cots.

Blacksmiths', cobblers', farriers', general, marine, saddlery, wheelwrights' and shelf hardware, and hardware supplies.

Soap and bleaching and washing powders.

Bolts (except for use of Engineer Corps).

Ice boxes and refrigerators.

Burlap, cotton, jute, linen, silk, and woolen fabrics, goods, threads, and yarns.
 Tool chests.
 Cobblers' and garment workers' power tools and machinery.
 Cotton, manila, and sisal rope.
 Scoured and unscoured wool.
 Gun and wagon covers.
 Cutlery.
 Leather, leather goods, and leather equipment.
 Forage.
 Rubber goods and tires.
 Hand tools.
 Horseshoes and horseshoe nails.
 Janitors' supplies.
 Jute.
 Tableware, kitchenware, and mess equipment.
 Needles.
 Office supplies and equipment.
 Paulins.
 Stoves and ranges.
 Subsistence.
 Tobacco.

Along with the conferring of such a vast amount of purchase business upon the Quartermaster Corps went a series of organization changes which made it more perfectly and exclusively a purchasing agency. During the early months of the war there was a natural development by expansion, new divisions being formed out of former subdivisions when the functions with which they were charged grew to the point of requiring separate control. At the end of January, 1918, however, a complete reorganization was effected, making the corps more nearly a purchasing machine. There were established the following divisions:

1. The General Administrative Bureau.
2. Quartermaster Supply Control Bureau.
3. Personnel and Planning Staff.
4. Reclamation Division.
5. Supply and Equipment Division.
6. Subsistence Division.
7. Fuel and Forage Division.
8. Remount Division.
9. Motor Division.
10. Warehousing Division.
11. Cantonment Division.

The Cantonment Division as previously explained, reported directly to the Secretary of War. The only operating divisions not having purchasing functions were the Reclamation Division and the Warehousing Division, the latter of which directed, of course, the necessary task of distribution.

About the middle of April, 1918, another reorganization was effected which tended further to make the Office of the Quartermaster General a purchasing, planning, and distributing organization. The set-up at this time was as follows:

1. Administrative Division.
2. Personnel Division.
3. Finance and Accounts Division.
4. Methods Control Division.
5. Supply Control Division.

6. Supply and Equipment Division.
7. Fuel and Forage Division.
8. Remount Division.
9. Motor Transport Division.
10. Transportation Division.
11. Depot Division.

This plan, with the modifications which will not be noted, formed the basis of organization until the Office of the Quartermaster General was combined with the Office of the Director of Purchase and Storage. On June 15, 1918, the Transportation Division was abolished. In May the Supply and Equipment Division was changed to the Clothing and Equipage Division and a further splitting of functions occurred in the establishment of separate Hardware and Metals, and Vehicles, and Harness Divisions. On June 12, 1918, the financial activities of the Quartermaster General's Office were organized under an assistant to the Acting Quartermaster General in charge of finances. By this arrangement the Office of the Quartermaster General was relieved from anything but a supervisional direction of these activities, which were later transferred bodily to the Finance Department. On June 14, 1918, there was another reorganization effected which had to do, however, more with control than with a change in divisions. By this order, which became necessary by the fact that the business had grown to such proportions that single executive direction became an impossibility, there were set up four assistants to the Acting Quartermaster General in direct charge over certain parts of the work. On August 15 the Depot Division became the Operations Division (in charge of storage functions), and, on September 21, a Motor Vehicles Division was formed. On September 18 there was organized the important Requirements Division, which was charged with the determination of requirements of articles procured under the direction of the Acting Quartermaster General.

This was practically how the Office of the Quartermaster General stood when a month later it was incorporated into the Purchase and Storage Service. The original office had lost all control over transportation, construction, finance, and accounting, and of the organization as it existed at the outbreak of war, only the Administrative and the Supplies Division remained. The Supplies Division, which at that time had consisted of but two branches, had grown to consist of nine purchasing divisions, organized on commodity lines. The office, outside of purely administrative or planning and control branches, was purely a purchasing machine.

One other matter requires notice. At the beginning of the war the Supplies Division had had two small branches which did not to any large extent actually control procurement. All procurement activities were decentralized to such an extent that each department, camp, post, and station of the Army made its own purchases of practically everything except uniforms and certain major articles. Early in 1918 a movement was started to centralize control over local procurement and place it under the control of the Quartermaster depots located at certain important purchasing centers and on July 1, 1918, 13 zones of procurement, known as general supply zones, were created. In addition to these 13 general supply zones, there were 13 subsistence procurement zones which, in most instances, were identical

with the former. The officers in charge of these zones—the zone supply officers—were given certain purchasing powers, as indicated in the following extracts:

The procurement, production, manufacture, inspection, storage, and distribution of Quartermaster supplies shall be performed by the general supply depot quartermaster (now known as the zone supply officer) acting under the direction of the Office of the Quartermaster General through its several procurement divisions, the number of which is dependent upon the volume of business and conditions concerning each class of supplies and operations. The several procurement and operation divisions in the Office of the Quartermaster General shall be located at Washington * * * or at some other point suitable for properly transacting the business. A general supply depot may, if necessary, be designated as the central agency for a certain class of supplies or operations.

Contracts or purchases shall be made by the general supply depot quartermaster (now the zone supply officer) when authorized by the proper procurement division in the Office of the Quartermaster General.

In addition to the above, there were organized in 1918 five remount procurement zones, which number was later decreased to three.

At the same time as the procurement zones were established, there were set up a corresponding group of distribution zones in charge of the distribution of various supplies to the camps in this country under their jurisdiction.

This system of zones, which was later carried over for use under the Director of Purchase and Storage, served to decentralize the actual operations of procurement and distribution, while at the same time the lines of control were tightly held in the various divisions of the Office of the Quartermaster General in Washington.

Organization of Office of Director of Purchase and Storage and Acting Quartermaster General.—On October 21, 1918, the consolidation of the Office of the Quartermaster General with the Office of the Director of Purchase and Storage, which then came into existence, actually took place, although the authority for it had been issued previously. In Supply Circular No. 80, of August 27, 1918, which had set forth the reorganization of the Purchase, Storage and Traffic Division, it was provided that:

The Quartermaster General of the Army shall report to the Director of Purchase, Storage, and Traffic.

The Quartermaster's Department, in addition to its other duties, shall have responsibility for and authority over storage distribution and issue within the United States of all supplies for the Army.

This provision was modified on September 12, 1918, by Supply Circular No. 91, which provided that:

The Quartermaster General of the Army, as Director of Purchase and Storage, shall have responsibility for and authority over storage, distribution and issue within the United States of all supplies for the Army.

It provided at the same time for the appointment of a Director of Purchase and a Director of Storage, both to report to the Director of Purchase and Storage.

Purchase and Storage Notice No. 1, dated October 19, 1918, provided the initial organization of the Office of the Director of Purchase and Storage. The organization of the Office of the Quartermaster General as it existed at this time served as the foundation. In addition to an Administrative Division and a Requirements Division, there were grouped within the Office of the Director of Purchase a number of procurement divisions, and within the Office of

the Director of Storage an organization for the operation of storage and distribution activities.

Soon afterwards, however, a new set-up was established, which continued in effect until the end of hostilities. This was described in Purchase and Storage Notice No. 19 of October 28, 1919, which followed the main headings previously established, but subdivided operations as follows:

1. The Office of the Director of Purchase and Storage.
2. Office of the Executive Officer, and under and reporting to the Executive Officer were the General Administration Division, the Statistical Division, and the Surplus Stocks Division, the latter being a new division organized for the purpose of disposing of surplus property owned by the War Department.
3. Office of the Chief of Requirements.
4. Office of the Director of Purchase with the following divisions reporting to it: The Purchase Administrative Division; Clothing and Equipage Division, Subsistence Division; Motors and Vehicles Division; Machinery and Engineering Materials Division, which took over the procurement activities of the Engineer Depot; the Raw Materials Division; the Medical and Hospital Supplies Division, which took over the procurement activities of the Surgeon General's office; the General Supplies Division; the Remount Purchase Division.
5. Office of the Director of Storage, with the following divisions reporting: Storage Administrative Division, Domestic Distribution Division, Domestic Operations Division, Overseas Distribution Division, Port Operations Division, and Salvage Division.

The Office of the Director of Purchase and Storage thus became the great operating machine for procurement, storage and distribution. Within it, the Office of the Director of Storage took over all the storage activities of the Army, while the Office of the Director of Purchase made arrangements to take over all procurement activities of the Army save the purchase of highly technical equipment and instruments, which were purchased by the Ordnance Department, Bureau of Aircraft Production, Chemical Warfare Service, and other branches of the Army which had charge of supplies and instruments which had not been standardized. Pursuant to this plan, the transfer of the procurement activities of the Depot Department of the Engineer Corps, except for certain articles, to the Office of the Director of Purchases was provided for by Supply Circular No. 99, October 22, 1918; the transfer of the Supply Division of the Office of the Surgeon General by Supply Circular No. 102, October 24, 1918; and the transfer of the Supply Division of the Signal Corps on October 23, 1918, by Supply Circular No. 103. The transfer of the procurement function of the Quartermaster Corps to the Office of the Director of Purchase, already practically in effect, was formally confirmed on November 6, 1918, by Supply Circular No. 110.

The consolidation of procurement into a central purchasing agency, while hardly realized before the war came to an end, was a great achievement from the point of view of the reorganization of the supply system of the Army and of the elimination of the wasteful and unbusinesslike methods of buying which were the inevitable results of the uncoordinated activities of the bureaus. The problem of organization was solved and the precedent of centralization was established.

READJUSTMENTS SINCE THE ARMISTICE.

READJUSTMENTS OF FUNCTIONS TO MEET THE PROBLEMS CREATED BY THE TERMINATION OF HOSTILITIES.

When, on November 11, 1918, the firing ceased on the fighting front as a result of the signing of the armistice, all the forces and energies of supply, which during the preceding months had been laboriously galvanized into tremendous action, had to be brought suddenly to a halt, and there were created by this immediate shutting down of the war machine new and burdensome problems. Millions of dollars worth of war contracts had to be terminated and adjusted, vast parcels of real estate, which had been rented or otherwise acquired by the War Department in connection with the necessity of providing adequate facilities, had to be evaluated and properly disposed of; numerous claims of various sorts against the department which had been inevitably incident to its unprecedented undertakings had to be adjusted; great quantities of war stocks and materials which had been necessary during the continuance of war in order to assure adequate supply at all times now became surplus and had to be sold; the whole process of embarkation and shipment had to be reversed; and generally the whole question of peace-time organization of the supply system of the Army, which had received such striking modification during the war, with all its attendant phases of procurement, calculation of requirements, standardization of material, storage, distribution, and transportation, was presented for consideration.

Contract adjustment.—One of the most pressing problems which required immediate attention was the termination and adjustment of contracts under the provisions of which the war industries of the country were turning out supplies with feverish activity. On the signing of the armistice there were within the War Department in the neighborhood of 25,000 to 30,000 of such contracts which it was necessary and desirable promptly to terminate.

In the making and fulfillment of contracts, obviously, in spite of the most scrupulous care and desire to render full justice many claims and disputes are bound to arise. Fortunately, machinery had already been set up within the Purchase, Storage and Traffic Division to handle disputes, claims and doubts arising under war contracts and procedure to terminate such contracts in the public interest had already been laid down for inclusion in the contracts when made.

As has already been pointed out in an earlier part of this report it was required by Supply Circular No. 88, dated September 7, 1918, that there be included in every contract negotiated for the War Department prescribed provisions for cancellation and termination before completion. These provisions covered cancellation for contractor's default, termination in the public interest, assignment of subcontracts and taking possession of contractor's plant. Referring particularly to termination in the public interest, Supply Circular No. 88 established definitely the payments to be made by the United States in the event of such termination, for articles completely manufactured at the time and for raw materials, for articles in process of manufacture and for the contractor's outstanding obligations incurred in good faith in connection with the performance of the contract.

Provision was also made for payment by the United States to the contractor of a fair amount on account of depreciation or amortization of plants, facilities and equipment provided by the contractor for the performance of his contract. In return, the United States was to be released from its obligation to take the remaining articles specified in the contract and to pay anticipated profits to the contractor on the unfinished portions of the contract. The contract provisions were worked out with considerable care to meet the situations presented both by fixed-price contracts and cost-plus contracts.

A large number of contracts entered into prior to the issuance of the above supply circular did not specifically provide for termination in the public interest. It was assumed that when it became necessary to terminate such contracts in the public interest, the parties would generally desire to adjust their rights on the basis of the equitable principles established by the provisions of Supply Circular No. 88.

Supply Circular No. 88 also provided that any claims, doubts, or disputes which might arise under a contract and which were not disposed of by mutual agreement might be determined by petition of the contractor to the Secretary of War or his duly authorized representative or representatives. As the representative of the Secretary of War to have jurisdiction in such matters, the Board of Contract Adjustment had been set up by General Orders, No. 103, War Department, November 6, 1918. This board consisted of three members having the rank of lieutenant colonel and was empowered to conduct hearings and reach decisions promptly and on principles of equity without the delays and technicalities which frequently attend litigation in the courts. It was believed that in most instances contractors would be satisfied with the decisions thus rendered and would not find it necessary to avail themselves of their rights to resort to the Court of Claims.

There were also in existence in the various supply bureaus the boards of contract review, which had been set up in the period from July 8 to July 26, 1918, at the instigation of the Supervisor of Contracts, who had been appointed by the Secretary of War on June 14, 1918. These boards were later placed under the Purchase Branch when the reorganization of the Purchase, Storage and Traffic Division took place and were given official recognition by Supply Bulletin No. 21, on August 16, 1918. These boards had been of great value in seeing that the contract and purchase policies established by the War Department were carried out in a uniform and consistent manner, and were therefore in a position to assist materially in the process of adjusting war contracts.

It is thus apparent that there was ready for use within the War Department valuable machinery for the performance of this important task.

Two days before the armistice was signed specific instructions were issued concerning the termination of contracts and orders in the public interest. Supply Circular No. 111, November 9, 1918, laid down the procedure to be followed. It directed that whenever such a contract or order contained express provision for termination, that provision was to be followed unless it was deemed in the public interest to effect termination according to the provisions of this circular and agreement of the parties could be secured. Whenever the con-

tract or order did not make express provision for termination, the contractor was to be requested to suspend work thereunder and submit a report showing in detail data upon which to base an estimate of his outstanding obligations and commitments. If agreement could be reached on a just and reasonable compensation to be paid to the contractor by reason of the termination of the contract, a supplemental contract was to be entered into embodying such agreement. On the same date Supply Circular No. 112 was issued to the supply bureaus instructing them, with a view to avoiding a chaotic condition in industry and labor which might result if large numbers of contracts were suddenly reduced, to secure the advice of the War Industries Board. The Office of the Director of Purchase, Storage and Traffic was designated to have charge of such relations with the War Industries Board, and the approval of the director was required before the suspension of certain contracts was ordered. This circular received further interpretation in Supply Circular No. 114, on November 13, 1918. Supply Circular No. 125, of December 3, 1918, set forth desirable forms for supplemental agreements.

The problem of contract adjustment, however, was not confined to the comparatively simple termination of regularly consummated agreements. The important phase of dislocation of industry and the labor market already mentioned had to be considered. In addition there was an even more serious complication which called for relief. Due to the imperative necessity for speed during the war, many agreements had been entered into during its progress which did not receive the binding sanction of a valid contract. Relying upon the good faith of the War Department, producers of this class had gone ahead on the basis of these arrangements, thus avoiding the serious delays which would have been caused by their insistence upon formal agreements. The number of these "invalid" contracts was large, and when the time for settlement arrived the interests of many war manufacturers were jeopardized by a decision of the Comptroller of the Treasury which prohibited the payment by the Government of their claims.

The existence of these perplexing questions and others made plain the necessity for the establishment of an agency with broad powers to lay down equitable policies and supervise their execution. This necessity had been realized by the Purchase, Storage and Traffic Division immediately upon the cessation of hostilities, and there had been set up within the Purchase Branch, on November 27, 1918, an Advisory Board on Sales and Contract Termination. On January 20, 1919, however, by War Department Circular No. 26, there was appointed the War Department Claims Board "to supervise and co-ordinate the work of the various War Department agencies engaged in the settlement of claims resulting from the termination of contracts or other procurement obligations of the department consequent upon the suspension of hostilities and to authorize and approve such settlements." The Assistant Secretary of War was made president of the board, with the Assistant Director of Munitions, the Director of Purchase, Storage and Traffic, and certain additional officers as other members.

About the same time curative legislation in regard to the invalid contracts was initiated in Congress, and on March 2, 1919, the so-

called Dent Act was approved. The purpose of this act was "to provide relief in cases of contracts connected with the prosecution of the war and for other purposes," and conferred upon the Secretary of War full authority to adjust all contracts both valid and invalid.

The War Claims Board was by General Orders, No. 33, War Department, March 3, 1919, made the agency of the Secretary of War to carry out the purposes of the Dent Act, and it was authorized to make use of the Board of Contract Adjustment and of existing agencies in the respective bureaus where contracts were made. These powers and duties were restated in General Orders, No. 10, War Department, March 19, 1919, with the added provision that they might be exercised by any individual member of the board under its authority and direction.

The procedure which was to be followed in carrying out the functions of the War Claims Board, together with forms for statements of claims, certificates of examinations, awards, etc., was set forth in great detail in Supply Circular No. 17, revised, March 26, 1919. Briefly, this procedure was as follows. All contracts under which claims for compensation might arise were divided into two classes:

Class A.—Claims based on agreements made by an officer or agent acting under the authority, direction, or instruction of the Secretary of War, and the nature, terms, and conditions of which had been reduced to contract form or are otherwise established by written evidence, i. e., claims where there was evidence of a contract existing in writing.

Class B.—Claims based on all other agreements covered by the provisions of section 1 of said Act, i. e., claims where it was necessary to prove the existence of a contract by oral evidence.

In connection with the adjudication of these claims, it was decided to use the agencies already in existence. All Class A claims were to be handled by the existing bureau boards of contract review, whose functions and personnel were so modified as to constitute them claims boards, some of which found it necessary to establish branches in various parts of the country. One member of the War Claims Board was in constant liaison with these boards and indicated the approval of the Secretary of War by signing the awards. It was considered that the Class B claims on account of their nature required legal talent and more formality in hearing. They were therefore assigned to the jurisdiction of the existing Board of Contract Adjustment. The same control by the War Claims Board was exercised through a liaison member as in the case of Class A claims, and approval of the Secretary of War was indicated by signature for the board.

One further existing agency was utilized in connection with the settlement of war claims. Under General Orders, No. 30, War Department, 1918, there had been established, as already pointed out, a Board of Appraisers within the Purchase, Storage and Traffic Division for the determination of just compensation for all property of whatever kind which had been requisitioned or commandeered during the emergency. The Board of Appraisers in carrying out these duties had built up an effective, trained organization, and the advantage of using this organization in the valuation of property involved in claims under the Dent Act was discerned. General

Orders, No. 41, War Department, March 25, 1919, was issued giving the Board of Appraisers additional authority over property "taken otherwise than by requisition, commandeering, or other summary process issued according to law, and without valid agreement fixing compensation therefor." This had the effect of turning over to the Board of Appraisers the work of fixing compensation on behalf of the War Claims Board for all property under adjudication of claim.

The War Claims Board thus not only passes on final proposed settlements or adjustments under contracts and agreements, but lays down the general policy covering such settlements or adjustments within any part of the War Department. It is the final authority with relation to these matters and the coordinating and controlling agency for all contracts and agreements to be terminated, reduced or adjusted within the War Department. The Board through the various agencies which it has used has performed a valuable service in bringing about the settlement of war claims along broad, constructive lines and has saved much time and money to both contractors and the Government in the avoidance of costly and tedious litigation.

Sale of war supplies.—Not only was the War Department faced, at the termination of hostilities with a large number of contracts for the production of war supplies, but it found on its hands large stocks of war supplies as a result of these contracts, as well as large reserve stocks which it had been necessary to maintain during the continuance of war and it became necessary to dispose of these surplus stocks of supplies and materials to the best possible advantage and least possible loss to the Government.

Legislation to take care of accumulated war supplies was enacted as early as the summer of 1918. On July 9, 1918, there was approved an act of Congress entitled "An act making appropriations for the support of the Army," which authorized the President, through the head of any executive department to sell upon terms deemed expedient, to any person, group of persons, Government department or any allied Government, any war supplies, material and equipment, by-products, or facilities acquired since April 6, 1917. Sale of guns and ammunition was to be limited to Government Departments, allied Governments and members of the National Rifle Association. A full report of sales activities was required to be presented on the first day of each regular session of Congress, and it was prescribed that the moneys received from such sales were to be deposited to the credit of that appropriation out of which was paid the cost to the Government of the property thus sold, whereupon these funds were immediately to become available for the purposes named in the original appropriation.

War Department Bulletin No. 50, dated August 31, 1918, provided with relation to the operation of this statute, that where the cost price of any such supplies was in excess of \$5,000 the approval of the Director of Purchase, Storage and Traffic was first to be obtained, and after it had been secured the sale was to be at auction or to the highest bidder on sealed proposals, except in the case of sales to a Government department or allied Government, in which case the sale price was not to be less than the invoice price, including cost of inspection and transportation.

Further amplification of sales procedure was made soon after the signing of the armistice, when the great volume of war sales was anticipated. Supply Circulars Nos. 117 and 119, November 21 and 29, 1918, provided that approval of the Director of Purchase, Storage and Traffic should be secured for all sales of \$100,000 instead of \$5,000, and that this approval was required in the case of all proposed sales of buildings, plants, factories, or lands, whatever the cost price of the property. Each supply bureau was required to maintain a division for the handling of the sale of war supplies and to maintain complete lists of such supplies which should be reviewed from time to time in order to report for sale surplus inactive supplies to the Director of Purchase, Storage and Traffic. A full report was required to be made on each sale immediately upon completion.

The problem of the disposal of surplus property sprang to first importance as soon as the armistice was signed, and on December 17, 1918, there was established in the Purchase, Storage and Traffic Division a Sales Branch under the direction of a Director of Sales, and on January 4, 1919, this office was filled by the Assistant Director of Munitions. War Department Bulletin No. 1, January 17, 1919, restated the law and provided that all sales of war supplies should receive the approval of the Director of Sales, and detailed instructions and forms were provided in Supply Circular No. 27, April 8, 1919, which called attention to the provisions of the deficiency act approved February 26, 1919, and added that the proceeds of all sales should be deposited and covered into the Treasury as "miscellaneous receipts on account of proceeds of Government property."

On January 24, 1919, it was found necessary to make an arrangement in regard to sales of supplies on hand as a result of the suspension or reduction of contracts. Supply Circular No. 11, January 24, 1919, permitted the execution of sales incident to the settlement of such contracts without reference to the Director of Sales; however, it was made necessary to secure the approval of the contracting office, board, or higher authority required to approve such contracts of settlements.

In order to assist and advise the Director of Sales in carrying out his functions, there were instituted by Supply Bulletin No. 4, March 7, 1919, a series of special boards. A superior Board of Sales Control was set up in the Sales Branch, consisting of the Director of Sales or his assistant, and the chief sales officer of each sales organization under the various bureaus of the War Department. It was made the duty of this board to serve the Director of Sales in a general way in regard to problems and policies. At the same time there were organized in each of the supply bureaus and departments a Local Board of Sales Control to examine sales within their bureaus to see that such sales conformed with policies and methods established by the Director of Sales.

Special provisions were provided from time to time in regard to the inventory and disposal of office equipment, sales of surplus property intended for export, etc., by Supply Bulletin Nos. 6 and 7, March 17 and 29, and Supply Circular No. 25, April 1, 1919.

Valuation and disposal of real estate.—An account of the organization and work of the Facilities Department of the Purchase, Storage and Traffic Division in connection with the purchase, lease, condemnation, and requisitioning of real estate or buildings and its rela-

tions with the Operations Division of the General Staff have already been described. The work of this department gained added importance with the cessation of hostilities when matters connected with the valuation and disposition of realty acquired in various ways for war purposes came up for settlement. Upon all requests for the purchase, lease, condemnation, or requisitioning of real estate or buildings, except leases of less than \$5,000 per annum, the approval of the Assistant Secretary of War was required. To pass upon real estate transactions, leases, requisitions, condemnations, purchases, and sales involving expenditures up to \$5,000 there was set up within the Facilities Service on January 21, 1919, a Board of Valuation and Review, consisting of three members. The board has been of much value in disposing of a great volume of small cases with which its duties were involved.

On April 1, 1919, by General Orders, No. 43, War Department, April 1, 1919, the Facilities Department of the Purchase, Storage and Traffic Division became the Real Estate Service of the War Department, under the direction and supervision of the Director of Purchase, Storage and Traffic. Its duties and functions were set forth as follows:

(a) The procurement by purchase, lease, rental, condemnation, requisition, or donation of all real estate, or interests therein (including buildings, docks, piers, offices, storage space) * * * required for the use of the War Department.

(b) The granting and renewing of all leases, licenses, permits, or privileges authorizing the use of any real estate, or interests therein, acquired for the use of the War Department.

(c) The sale or other disposition of all real estate, or any interests therein, including the cancelation, extension, or modification of all leases, licenses, permits, and privileges acquired for the use of the War Department.

(d) The establishment and maintenance of a filing and recording system for all grants, deeds, abstracts, leases, and other instruments pertaining to real estate and interests therein, under the control of the War Department, and the maintenance of an indexing and mapping system therefor.

The Real Estate Service is essentially an emergency service to effect the proper settlement of the real estate matters growing out of the war.

Finance.—The processes involved in the consolidation of financial activities continued after the armistice. The transfer of the procurement and storage of Chemical Warfare Service supplies at the various camps and cantonments was by Supply Circular No. 130, December 26, 1918, made to the Office of the Director of Purchase and Storage to be administered under the camp supply officers. In connection with this transfer the work of finance and accounting involved was placed under the direction of the Director of Finance to be performed through the camp finance officers whose creation will be noted below. By Supply Circular No. 2, January 4, 1919, later amended by Supply Circular No. 29, April 8, 1919, the storage and distribution of certain enumerated article of Ordnance material were transferred to the Office of the Director of Purchase and Storage, and

with the transfer went the work of finance and accounting in connection therewith to the Office of the Director of Finance.

On December 2, 1918, the entire functions and activities of subdepot quartermasters at camps and cantonments were transferred to the office of the Director of Purchase and Storage and the subdepot quartermasters became camp supply officers under his jurisdiction. At the same time the work of finance and accounting involved in this readjustment was transferred to the Office of the Director of Finance. It was provided that in each camp or cantonment the Director of Finance should designate a camp finance officer, who, within his camp and under the general supervision of the camp supply officer, should have charge of such finance administration, including disbursements, money accountability, and property accountability as the Director of Finance should direct. By this action the final step in the creation of a finance field force, began by the establishment of zone finance officers, was taken. It has already been noted that provision for the creation of the 13 zone finance officers had been made before the termination of hostilities by Purchase and Storage Notice No. 21, October 28, 1918, but that the system was not actually put into effect until later. The first step was taken toward this consolidation of the field finance activities of the various supply bureaus by the issuance of Finance Circular No. 36 of December 2, 1918, which transferred to the Director of Finance the activities, personnel, and records of finance organizations of the Quartermaster Corps, the Medical Corps, the Signal Corps, and various individual local organizations. Subsequently, by Finance Circular No. 43, December 11, 1918, and later circulars, the consolidation of other finance offices has been continued. Under the system evolved, there are 13 zone finance officers, on technical matters reporting to the Director of Finance, but under the general supervision of the zone supply officers. A close relationship was also required to exist between zone finance officers and camp finance officers, whose duties were more specifically defined by Finance Circular No. 50 of December 16, 1918.

On January 13, 1919, Supply Circular No. 5 reorganized the primary ports of embarkation and debarkation and provided that in addition to his military staff the commanding general should have certain other staff officers, among whom was to be the port finance officer, with responsibility for the payment of officers and troops at the ports, hospitals, and camps, when authorized by the commanding general or by the respective staff officers when authority had been delegated by the commanding general.

It is apparent that the various consolidations of procurement functions with which the consolidation of financial activities went hand in hand necessitated a very close connection between these two services and a clear definition of the complicated processes involved. With these purposes in view, Supply Circular No. 22 was issued on March 14, 1919, on the subject of the coordination of purchases and financial control and set forth a definite course of procedure to cover the procurement of all supplies and services chargeable against funds under the control of the Director of Finance.

Plans for reorganization within the Finance Department had been under way prior to the signing of the armistice. A definite plan was approved on February 24, 1919, by the Director of Purchase, Storage and Traffic. Finally, by Supply Circular No. 30, April 9, 1919,

provision was made for the Finance Service, under the Director of Finance, with responsibility for and authority over all disbursements, fiscal accounting, preparation of estimates and reports of accounts, reporting to and under the supervision of the Director of Purchase, Storage and Traffic.

Calculation of requirements.—The character of calculations of Army requirements changed when war ceased. During the war every effort was bent toward an exact and complete estimation of requirements against the Army program. When the fighting ended there ceased to be an Army program and there is as yet no definite program as the reorganization of the Army upon a peace time basis has not as yet been perfected. When the armistice began, the Army found itself with stocks on hand far in excess of any possible requirements on a normal basis and the problem of requirements control was reduced to the calculation as to how far new requirements would permit of the disposal of these surplus stocks.

Supply Circular No. 70 of July 27, 1918, laid down procedure whereby the total requirements of the supply bureaus of the Army on a war scale might be ascertained on a uniform basis and many of the instructions therein contained became inapplicable or inappropriate when the demand for war supplies ended. The general process, however, remains the same. The Requirements Branch of the Purchase, Storage and Traffic Division receives from the various supply bureaus estimates of their requirements for the year and these requirements are consolidated by the Requirements Branch. The Requirements Branch in turn will keep the various procuring agencies informed as to any changes in the Army program, size of the Army, etc., and in general is charged with the duty of developing a clear understanding of the methods and desired results of requirements computation, to the end that uniform methods and a uniform program may be followed. No change in requirements or methods or bases of computation may be made by the bureaus without instructions from or consultation with the proper division of the General Staff, and any change in any requirements schedule must be immediately reported to the Purchase, Storage and Traffic Division.

Procurement.—The procurement organization of the Army has remained practically unchanged since the armistice. Only two developments need be noticed. One is to the extent to which was extended the process of consolidating the supply organizations of the bureaus into a single purchasing agency for standard supplies, and the other is the alteration to some extent of the procedure of making purchases.

With regard to the consolidation of procurement, it was first intended to transfer all the procurement activities of the Ordnance Department to the office of the Director of Purchase and Storage, and on November 29, 1918, Supply Circular No. 120 was issued which provided for the "transfer of the procurement, storage, and distribution functions of the Ordnance Department;" this order was, however, later revoked by Supply Circular No. 2 of January 4, 1919, which confined the transfer to the storage and distribution functions. Later, however, the procurement of certain enumerated articles of ordnance equipment were transferred by Supply Circular No. 29, of April 8, 1919. No other transfers of purchase organizations have been made. In this connection it may be noticed that the consolida-

tion of storage organizations was carried out to a further extent than was the case in procurement.

During the continuance of the war it had been found advisable to prohibit the publication of certain information valuable to the enemy in regard to War Department contracts. Upon the cessation of hostilities it was possible to revoke these provisions and Supply Circular No. 4, January 11, 1919, provided that contractors were thereafter authorized and permitted to furnish and publish all information concerning War Department contracts and orders received by them. A little later alterations were made in regard to covenants relating to contract brokers and contingent fees in Supply Circulars Nos. 32 and 33, April 29, 1919. On March 14, 1919, Supply Circular No. 22 laid down in detail the procedure which was to be followed in the making of purchases and prescribed the proper coordination which should exist between procurement and financial control.

The Office of the Director of Purchase and Storage having responsibility for and authority over the purchase of the articles which had been assigned to it from time to time and the storage, distribution and issue within the United States of all supplies of the Army, became on May 1, 1919, the Purchase and Storage Service, reporting to and under the supervision of the Director of Purchase, Storage and Traffic.

Engineering and standardization.—One of the lessons learned from the war was that of the impossibility of successful operations without a centralization of supply control. When this had been accomplished it was made possible by planning and engineering to standardize many processes and articles which had been previously designed independently by the various bureaus, making for a great multiplicity of types, confusion on the part of manufacturers and of operating units making requisitions from the field, lack of interchangeability of parts, waste in purchase, increased size of stocks to be kept on hand, and general lack of simplicity in practice.

Advantage was soon taken of the opportunity afforded by the consolidation of procurement to put into effect some of the benefits of these phases of industrial engineering. The Bureau of Industrial Research was organized in the Office of the Director of Purchase, Storage and Traffic, and a group of engineers was associated in the work in an advisory capacity. Later, their activities were more formally organized into an Engineering and Standardization Branch.

During the continuance of the war the activities of the engineering and standardization group were directed to the reduction of packing dimensions in order to save cargo space. It is impossible to list the accomplishments that were made in this direction, but in addition to those given on a former page, a few examples may indicate the great necessity for standardization and what may be achieved under proper circumstances. Recommendations by these experts for the improved crating of a single shipment of 2,000 horse-drawn ambulances was calculated to effect a saving in shipping space of 300,000 cubic feet, roughly equivalent to the carrying capacity of a 5,000-ton cargo boat. In another instance, 50 carloads of freight were so repacked as to require the space of only 15, with proportionate savings in cargo space. It is estimated that all told the packing standardization activities resulted in the conservation of space in

thousands of freight cars and aggregated at least a million ship-tons. Likewise, there was a great reduction in losses due to faulty and defective packing. The money value of savings in packing materials and invaluable tonnage and cargo space amounted to millions of dollars.

Examples of standardizations of articles of supply may also be given. On an order for 300,000 hospital folding cots, through the preparation of comprehensive specifications, a saving was effected amounting to \$230,000, although on account of the urgency 100,000 were placed under the old design and specifications, and the saving applied only to the balance of 200,000. Where but one company was able to turn out cots under the old specifications, several hundred manufacturing concerns were able to turn out cots under the new specifications. In the standardization of tool chests, previously mentioned, the advantages were 50 per cent less cost, more tools, and smaller size. Through standardization, the requirements of the War Department for paints and varnishes were reduced from 250 products in paints and varnishes to 100, and from over 29 shades to 16 shades.

The more recent work of the standardization engineers has been conducted along three distinct lines:

(a) The standardization and research investigation of articles of purchase, including the reduction in numbers, sizes, and types of articles; the reduction in number of shades, colors, and finishes of other articles; the simplification and coordination of specifications of the various bureaus for the same article; supervision of preparation of new specifications where adequate specifications do not exist for any article; and otherwise completing for each commodity a simplified, harmonious, and conservative purchase schedule for the use of all corps and divisions of the War Department.

(b) The supervision of an exhibit of War Department matériel maintained by all bureaus for procurement and educational purposes.

(c) The supervision and study of basic raw materials, strategic raw materials, and substitutes for strategic raw materials.

Storage and distribution.—The principal addition to the storage and distribution service occurring after the armistice was the establishment of the system of camp supply offices, which was authorized by Supply Circular No. 124, December 2, 1918. The existing authority over and responsibility for quartermaster supplies vested in subdepot quartermaster at camps and cantonments was extended to include all Army supplies under the jurisdiction of the Director of Purchase, Storage and Traffic for storage, distribution, and issue, and the designation of these officers was changed to Camp Supply Officer. All of the organizations of the Ordnance Department, Engineer Corps, Medical Department, and Signal Corps at the various camps performing duties involving supply of the Army were consolidated under the camp supply officer. The camp supply officers were required to report to the zone supply officers under whose jurisdiction they operated. Instructions relating to the establishment of the camp, post, and other supply officers and their duties were issued from time to time and were summarized on February 25, 1919, by Supply Bulletin No. 1.

Supply Circular No. 5, January 13, 1919, previously referred to as organizing the staff of the Commanding Generals of the Ports of Em-

barkation, included provision for the Port Storage Officer whose duties included responsibility for and authority over storage and distribution of supplies of all departments, bureaus, corps, or other agencies of the War Department and the operation of all storage facilities. These duties were restated in Supply Circular No. 13, February 19, 1919 to be "the receipt, storage, and distribution of supplies of all departments, etc., and the control and operation of warehouses, and such piers and docks or other facilities as may be designated for the storage or delivery to ships or other carriers of such supplies."

The consolidation of storage and issue begun in the concluding months of the war was continued to the extent of including certain Ordnance and all of Chemical Warfare supplies. The transfer of the storage functions of the Chemical Warfare Service was effected by Supply Circular No. 130, December 26, 1918.

One important matter which required clear definition when the Office of the Director of Purchase and Storage had become fully established was the relative functions and responsibilities of the two main subdivisions of this service, namely, purchase and storage. This differentiation was laid down by the Director of Purchase and Storage in Purchase and Storage Notice No. 57, reprinted in Supply Bulletin No. 30, issued November 13, 1918. This order deals with the subject in detail. In general, the boundary line between the two spheres was placed at the inspection and acceptance of Government property.

The Office of the Director of Storage was equally affected with the Office of the Director of Purchase when on May 1, 1919, the office of their chief, the Director of Purchase and Storage, became the Purchase and Storage Service, reporting to and under the supervision of the Director of Purchase, Storage, and Traffic.

Transportation.—The problems of transportation were not ended by the armistice. The great army of American soldiers which had been safely carried across the ocean during the months of 1918 had to be brought home. Supplies for the troops while they remained abroad had to be transported to Europe and to some extent return cargoes of supplies and equipment no longer needed in France had to be returned. Arrangements had to be made for turning back to their former owners as soon as possible the ships which had been drafted into the service of troop transport and cargo carriage. Pressure on inland traffic was not so great but it was also affected by the process of debarkation and demobilization.

The Transportation Service was established on March 11, 1919, by Supply Circular No. 21, which provided that the Embarkation Service and the Inland Traffic Service should be consolidated into a single operating service which was designated as the Transportation Service. A Chief of Transportation Service was appointed with responsibility for and authority over the transportation of the supplies and personnel of the Army by rail and water.

A field service was provided for the Transportation Service on April 9, 1918, by Supply Circular No. 28. These arrangements were rescinded, however, by Supply Circular No. 41, June 5, 1919, in view of the same subject matter having been covered by General Orders, No. 54, War Department, April 21, 1919. This order provided that

in each territorial department, supply zone, post, camp, or other station, all transportation activities, except those pertaining to the Motor Transport Corps, should be consolidated into a single service, the personnel of the Inland Traffic Service being included in the consolidation at points where they were detailed. The officer in charge of these local transportation sections was designated the transportation officer. At ports of embarkation, transportation officers were also designated.

The organization of the Transportation Service thus became the fourth of the four fundamental services which have developed as the centralized supply system of the Army, reporting to and under the supervision of the Director of Purchase, Storage and Traffic. These services had been performed during the continuance of the war directly within the Purchase, Storage and Traffic Division. The steps by which these services have been discontinued within that division, which has become purely the organization through which is accomplished the coordination and supervision of the supply services on behalf of the General Staff, now forms the concluding section of this account of the Purchase, Storage and Traffic Division.

STEPS TOWARD DISCONTINUANCE OF OPERATING ACTIVITIES WITHIN THE PURCHASE,
STORAGE AND TRAFFIC DIVISION.

The function of the General Staff is to supervise and coordinate the activities of the various arms and services of the Army. When the Purchase, Storage and Traffic Division of the General Staff was organized in the spring of 1918, it was charged with the imperative task of providing a single guiding power to direct the decentralized bureau system of supply then operating under the strain of the emergency. There was immediate need for certain agencies which should perform, under unified control, functions in common for all bureaus. No such common agencies existed and it was necessary for the Purchase, Storage and Traffic Division to build them up within its own structure. Thus the single service for the handling of embarkation, which included the task of transporting troops and a vast volume of supplies, was organized; inland transportation was likewise made into a uniform system; storage and distribution were reorganized under single direction; the procurement of all supplies was regulated by means of a central agency; and finally the fiscal machinery of the Army, the operations of which were closely connected with all other services, was consolidated under unified control.

The establishment of this vitally necessary and previously nonexistent administrative machinery was authorized by legislation. The Overman Act, previously referred to, permitted the President, as he saw fit, to reorganize or consolidate any parts of the machinery of the Government in order to bring about a more perfect harmony of endeavor in the prosecution of the war. This act represented the will of Congress in reply to previous demands within and without that body for greater coordination.

At the conclusion of hostilities, therefore, the Purchase, Storage and Traffic Division consisted of an organization charged with the direction, supervision and coordination of the various requirements, procurement, production, storage, issue, transportation, finance and accounting, and sales activities connected with the supply of the

Army. The Army supply activities under the supervisory and coordinating control of the Director of Purchase, Storage and Traffic were administered and executed by the various operating services within the limits and in the manner prescribed by War Department orders and regulations. In view of the return to peace-time conditions and in order to avoid confusion as to the status of those War Department operating services which had of necessity been developed by the Purchase, Storage and Traffic Division in the absence of any preexistent organizations of the kind, they have received specific designation as services by recent orders which have been mentioned above. At present the operating supply services are the Finance Service, the Purchase and Storage Service, the Transportation Service, and the Real Estate Service. Like all other bureaus and departments of the Army, they report to and are under the supervision of the Assistant Chief of Staff, Director of Purchase, Storage and Traffic, on all matters which relate to the supply of the Army. The Director of Purchase, Storage and Traffic is to all intents and purposes the supervisor of supply of the Army. His office is not an operating service and does not perform operating functions.

PRESENT ORGANIZATION OF THE PURCHASE, STORAGE AND TRAFFIC DIVISION.

With the clear distinction having been made between the operating services of the Army which are subject to the supervision of the Director of Purchase, Storage and Traffic as supervisor of Army Supply and the supervisory functions of his office, the Purchase, Storage and Traffic Division has come to consist of a series of supervisory branches, each charged with the supervision and coordination of the activities connected with one of the major services of the supply system. The framework of the Office of the Director of Purchase, Storage and Traffic, organized on this supervisory basis is, on June 30, 1919, as follows: Office of the Director, Administration Branch, Purchase Branch, Storage and Issue Branch, Real Estate and Finance Branch, Statistics and Requirements Branch, Standardization Branch, Transportation Branch, Sales Branch.

Office of the Director.—The Office of the Director consists of two Assistant Directors, an executive and an assistant executive. Through these assistants close rein is held over the entire operations of the division by means of a grouping of branches for purposes of direction under each, and relation is maintained with the War Department Claims Board which works in close cooperation with the branches of the division.

Administration Branch.—The Administration Branch, in charge of the executive, has charge of the usual routine services incident to the operation of a governmental organization. These include sections in charge of mail and records, orders and regulations, cables and building service. In addition there is an important section on External Relations. Its duties include both domestic and foreign relations. In regard to the former it maintains relations and conducts negotiations with representatives of all other Government agencies and all domestic agencies in matters pertaining to supplies for the Army. It also furnishes liaison officers for the various branches of the division. In regard to foreign relations, it maintains and conducts negotiations with representatives of foreign Governments in matters

pertaining to supplies and supervises and directs the compilation and maintenance of records pertaining thereto.

Purchase Branch.—As stated in Purchase, Storage and Traffic Office Order No. 33, 1919, the duties of this important branch embrace generally the formulation and supervision of the execution of the War Department purchasing policy. In pursuance of this it studies methods of purchase and recommends changes and improvements therein; provides publicity of War Department requirements, contracts and awards; maintains up-to-date lists of all materials purchased by the different bureaus; accomplishes liaison between purchase services and sales branches in the War Department; supervises and coordinates all matters involving patents and rights to inventors, including compensation for the use thereof in the Army, and maintains liaison with the Munitions Patent Board and the patent sections in the various bureaus; supervises and directs the operations of the Board of Appraisers which determines just compensation for all property commandeered or requisitioned, and takes action on all claims against the Government for damages to property of all kinds. By Supply Circulars Nos. 44 and 45 of June 30, 1919, the War Department exhibit of standard equipment and supplies and the preparation of the matériel catalogues which had rested within the jurisdiction of the Engineering and Standardization Branch were transferred to the Purchase Branch.

As at present organized, the Purchase Branch consists of the following sections: Methods Section, Patents Section, Production Section, Inspection Section, Purchase Information Section. The functions of three of these sections have been sufficiently indicated by the above. The Production Section maintains accurate data covering the commodity production possibilities of the country, acts as the consulting production agency of the War Department and, as such, maintains data on the industrial situation of the country as applied to the War Department program and exercises supervision over all production methods in the War Department supply activities. The Inspection Section exercises supervision over all inspection methods in the War Department supply activities.

Storage and Issue Branch.—This branch was established by Purchase, Storage and Traffic Office Order No. 17, February 18, 1919. It supervises and coordinates all activities connected with storage, distribution, and issue of supplies and equipment for the Army; initiates the storage program necessary to the needs of the Army as authorized by Congress; and in general, handles all important matters affecting the administration, supervision, and policy of the Storage and Issue Service. The words "storage and issue" refer to all the activities affecting the supplies of the Army after they have been procured, and the Storage and Issue Branch has to see that all supply departments, including Purchase and Storage, Signal Corps, Ordnance Department, etc., cooperate in their work and that the function of storage and issue coordinates with that of Purchase, Transportation and Finance, and disposition of Government property.

Real Estate and Finance Branch.—On May 15, 1919, Purchase, Storage and Traffic Office Order No. 53 discontinued the Real Estate Branch and Finance Branch as separate branches and consolidated them into a single branch to be known as the Real Estate and Finance

Branch. The duties it carried over from its two former components consist of the supervision and coordination of the operating services conducting the lease, purchase, and disposition of real estate for the Army, and the direction of the activities of the Board of Valuation and Review; the exercise of coordinating and supervisory jurisdiction over the finance and accounting service of the Army.

Statistics and Requirements.—The Statistics and Requirements Branch compiles and maintains statistical records and studies; makes analysis and compilation of requirements of the Army in accordance with the information furnished by the Chief of Staff as to the organization and strength of the military forces and the equipment tables prepared by the Operations Division, General Staff, including compilation of requirements of materials and components which are to be used in the performance of contracts placed by the War Department; and supervises, coordinates and directs these activities in the various requirements branches of bureaus and operating services. In the above connection a study of basic raw materials is being conducted which will be of prime importance in connection with possible further operations in view of the world shortage of such fundamental elements of supply.

Standardization Branch.—This branch was the Engineering and Standardization Branch until June 7, 1919, when its Production and Inspection Sections were transferred to the Purchase Branch and its name was changed to Standardization Branch. With the transfer of these sections went also supervision of the preparation of the exhibit of standard equipment and supplies and supervision of the work of standardization classification and cataloging of material. As at present organized it constitutes mainly a research organization for the study of all problems of standardization in connection with the supply system of the Army.

Transportation Branch.—When the separation of General Staff supervision from the executive and operating services was effected, so far as transportation activities were concerned, by the establishment of the Transportation Service by General Orders, No. 64, War Department, April 21, 1919, provision for superior supervision had already been provided by the creation of the Transportation Branch of the Purchase, Storage and Traffic Division on March 13, 1919. The Transportation Branch prepares plans for the transportation of troops and supplies, upon information furnished by the War Plans and Operations Divisions of the General Staff; studies and passes upon policies in force, and recommends rules, regulations, and legislation affecting the transportation of the Army; coordinates matters of transportation between the various corps, bureaus, and departments of the War Department; takes up with other divisions and branches of the General Staff all matters relating to transportation policies; keeps in close liaison with the Railroad Administration, and the transportation interests throughout the country, and exercises a general supervision of the operation and work of the Transportation Service, in matters of policy.

Sales Branch.—Under date of December 17, 1918, the Sales Branch was established and the Director of Sales was designated. This action was confirmed by Supply Circular No. 16, February 27, 1919. The Sales Branch was charged with responsibility for dis-

posing of surplus property in the United States on terms advantageous to the Government, without competition in sales between various bureaus and without undue interference with existing industry. There was set up, for the purpose of supervising sales, an organization consisting of various commodity sections charged with the furnishing of technical advice with reference to the particular classes of commodities over which each has supervision. A Board of Sales Review, consisting of various members of the sales organization receives technical reports from the various commodity sections and has submitted to it details as to material to be sold which is cleared through this board. Methods of sale, price, and general policies are recommended to the Director of Sales for his approval before the surplus material is placed upon the market, and advice is furnished him on matters pertaining to sales policies. There is also an Administrative Section, a Sales Promotion Section, and a Contract Section.

This entire organization is directory and supervisory, the actual operations of sales being handled through sales boards in the various War Department bureaus having surplus material on hand within their jurisdiction. A member of each of these sales boards, together with the section chiefs and Assistant Directors of Sales of the Sales Branch, constitute a Superior Board of Sales Control, meeting weekly to discuss such problems as may arise with regard to sales within the various bureaus.

VI. MISCELLANEOUS BRANCHES.

THE STATISTICS BRANCH.

During the first eight months of the war, the Army increased in size from 200,000 to 1,000,000. Before the war there had not existed in the department any central statistical office. The department was small enough and the executives sufficiently well acquainted with each other so that it was possible to secure information through personal contact and acquaintance.

With the rapid expansion of the department and the constant creation of new offices, it became impossible for the chief of any service to have intimate personal knowledge of the details of the work under his control.

As this situation developed, small statistical offices began to spring up in the different supply bureaus. The Ordnance Department, the Quartermaster Corps, the Signal Corps, the Engineer Corps, and Medical Corps began to assign officers to the duty of keeping records of contracts placed and deliveries which were beginning to be made. There was not, however, any central office for collecting and coordinating the information from these scattered bureau offices. There was no single office which was able to tell, for example, whether or not a sufficient supply of clothing and of the equipment supplied by the various bureaus was actually on hand to warrant making a draft call.

With the reorganization of the General Staff under General Order No. 14, a central statistical office was established, under the supervision of the executive assistant to the Chief of Staff, charged with the duty of collecting, compiling, and maintaining all statistical infor-

mation relating to the war program, for transmission to the Secretary of War, the Chief of Staff, the War Council, the General Staff, and the several divisions thereof.

The new office came into existence by the transfer from the Council of National Defense of the director of its Statistical Division and 25 of his assistants. This office had been in existence since the beginning of the war, and since August, 1917, had been making weekly reports to the Secretary of War on the progress of military preparations. It had, in addition, compiled a number of special reports on the shipping available for transportation of troops and on the production of aircraft and munitions. By March, 1918, this work had been completely transferred to the War Department and was organized as the Statistics Branch of the General Staff.

The most important work of the Statistics Branch has been the compiling each week of a report consisting of about 50 pages of diagrams and tables setting forth the most important information relating to the progress of the war program and operations. By June 30, 1919, this report had been issued for about 100 consecutive weeks. The object of the report has been to place each week before the Secretary of War, the Chief of Staff, and the heads of the various Army divisions the information necessary for making decisions with regard to military policies.

The branch has done in addition much supplementary work. It has issued each week a condensed report for the President, and each month extensive reports on shipping and on personnel. There have also been prepared about 135 special reports covering a great range of military subjects, an average of more than one special report each week.

By the end of the summer of 1918, the weekly report had increased in scope so that this branch issued not only a regular weekly report but also separate supplementary reports for the chiefs of the supply bureaus and their assistants. A typical weekly report at that time covered more than 1,000 subjects, with an average of about five items of information for each subject. Part of this information came in by letter and telegraph, but the rest of it was secured from more than 100 different offices in Washington located in some 25 buildings.

All this information was checked, verified, and converted into diagrams within a comparatively small number of hours after it was received. The diagrams were reproduced by means of the photostatic process. During the busiest months of the war the output of these sheets of statistical data was in excess of 1,500 each day. The Statistics Branch of the General Staff has made a greater and more varied use of these graphic methods of presenting facts than has ever been made elsewhere by any other organization. Since the inception of the work more than 100 officers have been assigned to the branch. Of these, more than half came from professions, and most of the rest from the statistical and accounting offices of business firms. Only three have been Regular Army officers. Nearly all were young men, and most of them had received thorough technical training in colleges, universities, and graduate schools.

From its inception, the Statistics Branch has been organized as a section of the Office of the Chief of Staff, and has been directly accessible to the Chief of Staff and to the Secretary of War.

By means of weekly lectures, illustrated by wall charts, officers of the branch during the greater part of 1918 furnished the chiefs of supply bureaus, the Maritime Council, the House and Senate Committees on Military Affairs and other important bodies and individuals, information relative to supplies, shipping, movements of troops, etc., which was necessary for those charged with carrying out the Nation's policies and programs.

The branch trained and in March, 1918, sent overseas the nucleus for Gen. Pershing's Statistical Office and in December, 1918, supplied the statistical force for the American Commission to Negotiate Peace.

The existence of cooperating officers in the United States and in France greatly aided in supplying officers in both countries with essential information.

The Statistics Branch has been from the beginning an office for the interpretation and presentation of information. Its work has been to separate the essential information from the incidental and to present it so promptly that it would be immediately available, so accurately that it would be entirely reliable, and so clearly that it could not be misunderstood.

In addition to its regular work of presenting current information, the branch has been able to make a beginning in the development of a science of military statistics. Units of measure have been devised, methods of computation developed, and standards of attainment established for dealing with a large range of military problems.

Methods and data are available for dealing with such matters as the time required to raise and train different sorts of troops; the proportion of men fit for military service; the time required for the procurement of different sorts of munitions; the carrying capacities of ships in terms of men, animals, motor transport, and supplies; how fast clothing wears out; storage space required; the analysis of the data of battle costs and accomplishments; and so on over a great range of subjects.

The lessons of the war indicate that the work of the Statistics Branch must not be suspended, but that as an aid to efficiency in peace and a means of preparedness for war, it will be necessary to provide for a permanent central office of military statistics within the organization of the General Staff, which will maintain the contacts with the great numbers of sources of military information now established by the Statistics Branch and which will keep up to date the valuable and comprehensive data collected by this branch since its organization.

THE MORALE BRANCH.

In the conduct of the war all the belligerents have given attention to and recognized the importance of the mental forces in armies.

The extent to which the Central Powers relied upon the depression of the morale of the military forces and the civil populations of their opponents, particularly in the Russian and Italian campaigns, was generally known, as was also the wide use by all the armies of propaganda calculated to lower the morale of their opponents.

Just as the industrial strength of the country had to be directed into war ends, so was there necessity also for using the tremendous

war determination of the American people to constitute that mental force in armies which Napoleon declared "is to the material as three is to one." While the German armies had for some time maintained a so-called "educational service," the American Army was the first to establish an organization which would facilitate the adjustment of the recruit to the military environment and systematically survey conditions effecting a state of mind so as to advise commanding officers how best to preserve contentment and high morale. The organization of this work, which finally culminated in the creation, in October, 1918, of the Morale Branch of the General Staff, which, under the supervision of the executive assistant to the Chief of Staff, was charged with the improvement of the efficiency of the soldier through the betterment of morale, was the natural outcome of the auxiliary morale work carried on by the various welfare organizations, in which the United States was also a pioneer. Their work, however, bore only an indirect relation to military efficiency, and in the light of European experience, it was realized that maintenance of military morale was strictly a problem for solution by the Army itself. This conviction was also strengthened by the experience in developing the fighting spirit through the training period when many diverse morale measures, later standardized, were first given practical effect by individual commanders.

The sudden cessation of hostilities gave but little opportunity for the Morale Branch to function under war conditions, but the successful administration of morale work in a limited field conducted by the Military Intelligence Division and in certain camps had demonstrated its military value.

It has been in the readjustment period of demobilization that morale work has had its greatest practical application, and it is believed that it has played its fair part in allaying many of the cases of discontent and difficulties which are usual upon demobilization of large armies.

In the present, as in the past, the commanding officer is the real morale officer. It has been found, however, that with the manifold duties devolving upon him, and in view of the many factors bearing upon morale which are too numerous to reach the individual attention of the commanding officer, he must depend to a large degree upon an officer who will specialize in the subject.

It is the function of the Morale Branch, General Staff, to make a coordinated study of the entire subject of morale and to furnish the service with ideas which, in practical experience, have been found to be of value in maintaining the desired discipline and spirit.

It is believed that the experience and collective knowledge of the older officers in the successful handling of men are based on general principles capable of wide application, and, if collated, will undoubtedly be of assistance to younger officers of the Army. Such collation is now in preparation for eventual dissemination to the service.

Concerned originally with effective stimulation of fighting troops, and later with the maintenance of morale during the process of demobilization, morale work has now entered upon a third phase, that of application to the Regular Establishment.

Its organization has, therefore, been extended by the appointment of morale officers upon the staffs of all department commanders and

the directed establishment of morale organizations at all organized divisions, posts, camps, and stations, or points of activities of staff departments, where appreciable numbers of officers and enlisted men or civilian employees are stationed.

The Morale Branch has made extensive use of publicity facilities of the service. News, editorials, and cartoon matter bearing upon morale has been regularly furnished the various camp and service papers. Also, at the suggestion of the Morale Branch, there have been organized publications in the majority of the base hospitals, which reached, in several instances, circulations of from 50,000 to 75,000 copies each week. The motion-picture field was not neglected, and, in addition to the insertion of morale points in regular releases, special animated cartoons dealing with particular problems were prepared and routed through the camps. Because of the value of pictorial representation of ideas a service series of morale posters was instituted which has had the advantage of appealing to many whose education prevented consideration of reading matter.

Lectures also have been utilized to a large degree, particularly in connection with morale units placed on homeward-bound transports to make use of the predischARGE period for intensive inculcation of ideas of good citizenship, maintenance of soldierly conduct while wearing the uniform, what would be expected of the returned soldier, reentrance into civilian employment, etc.

As one of the most effective means of allaying unrest while awaiting discharge, educational courses were originated and carried on as morale measures. In spite of the fact that the courses on educational and vocational subjects have been optional, attendance and interest have been so conspicuously general as to indicate wide demand for such systematized training and to fully justify any effort expended on its continued use and expansion. As morale agencies, and irrespective of their other benefits, such courses have proved of great value and there was no question as to the welcome given them by the men. While exact figures can not be given for the total of men enrolling for these courses throughout the service, because of the changes of demobilization, in the educational courses at one camp 4,362 men were enrolled at one time, and at another approximately 4,000 men were engaged in a practical course in farming. The attendance at other camps has been correspondingly large.

While all the facilities of the welfare organizations have been utilized in so far as they touch upon morale, the real basis for the work rests upon a military foundation, and so morale officers in touch with individual problems have been chiefly used as morale agencies.

All important information secured through investigation or new practical ideas tried out by individual officers are incorporated in circulars and thus disseminated throughout the entire field organization.

In addition to their particular duties, morale officers have frequently been of assistance in recruiting and Liberty loan campaigns, and in furthering the efforts of war-risk insurance and agricultural representatives and agencies engaged in providing employment for soldiers on discharge.

The experience of the war has demonstrated the desirability of maintaining, as a part of the permanent organization of the Army, a centralized supervision of morale matters.

VII. DEMOBILIZATION.

SITUATION ON NOVEMBER 11, 1918.

The signing of the armistice on November 11, 1918, marked the completion of the military victory of the allied forces and caused an abrupt cessation of active hostilities. The object of all military endeavor had been attained and scarcely an activity or an individual was not affected by the great transition from war to peace conditions. For the General Staff in this country its duties and responsibilities connected with the work of mobilizing, training, equipping, and transporting soldiers to the theater of operation and there maintaining them, were brought to a sudden end and new and entirely different questions arose.

All belligerent countries were faced with the necessity of reducing their armed forces to an extent compatible with safety under the changed conditions. In the case of the United States problems confronting the General Staff were complicated and made unusually difficult of solution by the fact that its forces were in a land separated from the home country by the breadth of the Atlantic Ocean. The task of demobilization in numbers of men alone was tremendous—a fact which is well illustrated by the following table which shows the strength of the emergency Army as of November 11, 1918:

	Officers.	Men.	Total.
U. S. Army in Europe.....	80,842	1,858,474	1,949,316
Marines with Army in Europe.....	1,002	31,383	32,385
Total American Expeditionary Forces.....	81,844	1,899,857	1,981,701
At sea, en route to Europe.....	1,162	21,072	22,234
Total American Expeditionary Forces and at sea.....	83,006	1,920,929	2,003,935
In United States.....	104,155	1,530,344	1,634,499
Total in United States, American Expeditionary Forces and at sea.....	187,161	3,451,273	3,638,434
In insular possessions, Alaska, etc.....	1,977	53,758	55,735
In Siberian expedition.....	298	8,806	9,104
Total U. S. Army.....	189,436	3,513,837	3,703,273

It was obvious that the country should be expeditiously relieved of the expense of supporting these forces and that the men themselves should be speedily returned to their families and to their normal places in the social and industrial life of the Nation, as expeditiously as the changed military situation permitted. Many limiting factors and conditions were, however, in existence. The fact that 2,000,000 men were to be brought back from France in itself showed at once that demobilization could not be effected within a period of weeks. Moreover, the signing of the armistice did not put an end to the war—it was merely a cessation of active hostilities during the time that negotiations were being discussed. The emergency still existed and would continue to exist until the preparation, signing, and final

ratification of a treaty of peace should have been accomplished. It was always possible that the enemy might violate the armistice terms or refuse to sign the peace treaty. To guard against further attack and to have at hand the means to resume hostilities, should such a course become necessary, it was essential that an allied army of occupation be maintained until the termination of the armistice and probably longer. However, by the crushing military defeat administered to her, and by the terms of the armistice, the forces of Germany had been so weakened that it was evident that the nations opposed to her could materially reduce their vast military establishments.

After 19 months of concentration of all national activities to the one end of the production and upbuilding and maintenance of an effective war-making machine, the solution of the problems of readjustment were not to be lightly undertaken. The welfare of the Army and of the country demanded that definite provisions should be made for the wise redistribution of the men to be returned to civil life and that there be effected the best possible disposition of the property and material which had been accumulated. Economic and industrial considerations demanded assurance of the orderly disbandment of soldiers with the minimum of disturbance to the business world already engaged in the complicated and delicate task of industrial and economic reorganization. This problem involved such considerations as coordination with the labor and employment situation; measures to prevent congestion of unemployed ex-soldiers in the larger cities; the securing of positions for discharged men; the disposal of surplus stocks of supplies and material and the termination of contracts with due regard for the interests of industry and the interests of the Government.

As may be seen from the table given, there were in the United States itself over a million and a half men comprising organizations which had never left this country. The great majority of these could be disbanded. It was, of course, necessary to make provisions for the reception and disposition of men and equipment from abroad. All these considerations made it of utmost importance that the Army should develop as soon as possible a comprehensive demobilization policy, based not only upon its own interests, but upon those of the country at large.

DEMOBILIZATION IN OTHER WARS AND IN OTHER COUNTRIES.

There were few precedents afforded by the experience of former wars which were of value in making up such a policy. The soldiers demobilized after the Revolutionary, Mexican, and Civil Wars were afforded boundless opportunities for occupation by the possibilities inherent in economic and territorial expansion of the country. The War with Spain had made necessary the expansion of the Army to only 280,500 and the demobilization of the men rendered surplus upon the return to peace strength did not involve economic problems of great magnitude.

A study of European wars showed that the Franco-Prussian War, finally brought to a close by the treaty of Frankfort, signed May 20, 1871, did not present problems of demobilization closely analogous to those confronting the United States in November, 1918. The

French forces in 1871 were destroyed by being outmaneuvered and outnumbered. The resources of neither nation were exhausted and the French were defeated by military means. Both France and Germany were agricultural countries and, in the absence of an economic or industrial crisis, both countries readily absorbed their discharged men.

The Russo-Japanese War was also not an economic war. At its close Russia had to demobilize a surplus of 323,000 men and the distribution of this small number among a population of 143,000,000 did not cause great economic difficulty. Japan discharged approximately 568,000 men who returned to civil life in a population of about 47,000,000. The records of the demobilization of this army are meager and afford a possibility of only limited study. Owing to the fact that Japan was then essentially an agricultural country, however, it seems unlikely that the return of these soldiers caused serious difficulties.

At the close of the Boer War, the forces opposed to Great Britain numbered only about 20,600 men, who were gradually returned to their homes. The men of the British expeditionary army at the close of the war went home to find that England, deep in labor problems, was experiencing one of the most critical problems of unemployment.

At the close of the war, Germany was in disintegration, demoralization, and social upheaval. The terms of the armistice provided that German forces should withdraw behind the Rhine within 25 days and that demobilization should then begin. With military authority practically nonexistent, however, formal demobilization of the disorganized German forces could not be carried out and the Ebert government was finally forced to beg the soldiers to go home and demobilize themselves in as orderly a manner as possible.

In France, a country which for years had had universal military service, demobilization meant a return from service with the colors to the reserves. All men were already arranged in classes according to the year in which they had originally been called to the service. In demobilization, the orders provided that the classes of 1887, 1888, and 1889 be the first to pass back into the reserves, and provided a regular schedule for demobilization of other classes which it was no longer necessary to retain in active service.

A somewhat similar plan was followed in Italy, where like conditions prevailed. In March all the class of 1885, with the exception of automobilists, were to be discharged; the class of 1886 followed toward the end of the month. Each month thereafter two classes were to be discharged until the process should be complete for all men no longer needed.

The case of Great Britain presented the nearest analogy to that of the United States. Long before November, 1918, the Minister of Reconstruction and an advisory department had made a survey and drawn up plans to place properly in their proper occupations the millions of returning soldiers. It had been estimated that some 60 per cent of England's soldiers had positions awaiting them, and an elaborate system was built up for the purpose of bringing together the man and the employer. The scheme, however, was complicated by the fact that great amounts of raw material were needed, and

that replenishment of such basic stuffs required ships for its transportation from the other countries; to return the Army also required ships. Effort was therefore made to coordinate demobilization with the economic conditions at home, and the general plan which it was proposed be followed was roughly that when employment should be awaiting the individual soldier, and when there should be sufficient material for him to work with, then that soldier should be discharged.

To carry out such a plan required a most intricate and complex system. There were some workmen who not only had positions awaiting them but on whose labor production depended. In systematizing the scheme prior to the armistice, cards had been issued to each soldier, on which he was required to give data concerning his previous occupation and as to whether a position awaited him. Means were necessary to verify these statements made by the men. Employers also were asked to submit cards giving the names of those soldiers whose services they particularly desired. In this way it was attempted to bring together the man and the employer. The limitation regarding the availability of material which the man would need in order to perform his labor introduced a difficult factor and made necessary a most elaborate and peculiar system of demobilization according to industries. The outstanding feature of the final British policy was its subordination of the military to civilian interests. The release of men was to depend on the ability of the individual to obtain employment and on the value assigned each particular industry as contributing to general national welfare. This elaborate scheme, worked out in advance of the end of the war, had been given great publicity. The actual operation of the British plan has been severely criticized. Many men who felt that they should be given speedy discharge claimed that they had been unjustly discriminated against. The cry of the Army for immediate return home was loud and insistent. In practice this system of England's was largely modified as a result of the demand of the people that many of its tentative arrangements be made more simple. However, when the adoption of a method of demobilization for the United States Army was being considered the elaborate system of England was at the very beginning of its operation and put directly before this country an example of an "industrial demobilization."

DEMobilIZATION IN THIS COUNTRY.

The choice of issue.—Formulation of a demobilization policy for the United States Army had been begun by the General Staff about the middle of October, 1918. It was soon perceived that there was definitely presented a choice between some form of demobilization by occupation, the plan adopted by Great Britain, and demobilization by military units. In short the question was, should the United States discharge men according to occupational classes and make the order of discharge dependent on the availability of employment, or should the plan be adopted to disband complete military organizations in the order of their availability for discharge? Most careful consideration was given the issue involved in both systems before final decision.

Demobilization by occupation would have disrupted military units necessary for the proper supply and maintenance of the Army overseas and would have seriously impaired the efficiency of those organizations whose retention in the Army was necessary. Since it would require an entire regrouping of all men in the service this plan would have been slower of operation and much more costly than would be demobilization by military units. Moreover the military situation overseas would not have permitted the return from France of men grouped according to occupations.

The plan making the order of discharge dependent upon the availability of industrial positions to which the individual might return on submitting a request stating that employment awaited him, was also considered and deemed impracticable. Had the War Department announced such a system of discharge on individual application, practically every man in the Army would at once have submitted his request for immediate discharge. As it would not have been possible to discharge immediately all who applied for such discharge, the different applications would have required careful study to determine which was the most deserving and who should be discharged first. This comparing of the relative merits of individuals for discharge would have involved an almost inconceivable amount of work and would have very greatly retarded the progress of demobilization. To try to decide the priority for discharge of individuals in an army of nearly 4,000,000 soldiers would have created infinitely more dissatisfaction among the soldiers, who were not selected for early discharge, than the method used of discharging first all men in units that could be spared.

Under the plan adopted hundreds of thousands of men were soon returned to their families, home communities, and industrial centers, who might not have been released for months if the War Department had attempted to inaugurate a scheme of demobilization based largely on individual requests for discharge.

As a result of this plan for demobilization by military units, to the end of the fiscal year 2,608,218 enlisted men and 128,436 officers were discharged from our temporary forces, and have assisted in the revitalization of industrial life and in expediting the return of the country to normal peace-time conditions.

Further provisions of the plan adopted were for a classification of all military units as surplus, or as essential for temporary needs, and for the arrangement of a priority schedule for demobilization by which the least necessary units should be disbanded in the order in which they became surplus, leaving the remainder of the forces entirely intact. Industrial and employment considerations, problems which were rendered much easier of solution by the fact that each division contained within itself industrial strata of many different occupations, were met as fully as was possible within the unit system. The main features of the policy were that it secured an orderly return of the troops, that priority schedules within the military system maintained the Army as an efficient machine, and that sufficient elasticity of operation was furnished for special and individual cases.

In general the principles on which the policy of demobilization by military units was carried out were that no one should be discharged at any place other than at the camp nearest to his home, that no

one should be discharged while there remained a possibility of improving his physical condition, that the ex-soldier's prospects as a civilian should be furthered as much as possible, that each officer should be given an opportunity to qualify for a commission in the Reserve Corps, that everything should be done to encourage officers and enlisted men to go directly to their homes, and that the processes of demobilization should be as rapid as possible.

Early steps.—The choice of policy having been made, the next considerations were the determination and establishment of methods to be adopted in order to carry it out. These decisions and the close supervision and coordination of the actual work of the machinery created direct responsibilities for the Operations Division. The first steps in actual demobilization were taken while the policy itself was being formulated and consisted in those measures which became obviously necessary as soon as active hostilities were brought to a close. At this time movements of drafted men were then contemplated which would have added greatly to the strength of the Army. On the morning of November 11, immediate discontinuance of all mobilization was directed and subsequent orders to the Provost Marshal General canceled all draft calls pending developments. Registrants were notified that they reverted to the status they had had before receiving their calls. All such men who had reported were discharged from the Army.

It was found that there were certain pressing needs which for the good of the country, and in order to expedite demobilization, necessitated the discharge at an early date of certain industrial workers. The only three classes of occupations included were anthracite coal miners, whose services were needed to avert a threatened shortage which might have caused great suffering to the civil population during the winter; railroad employees needed to relieve the anticipated strain on the railroads who would be called upon to transport the hundreds of thousands of men to be discharged, and finally railway mail clerks whose services were badly needed.

When the scheme for demobilization was put into effect, it was realized that there would arise in units whose demobilization had not been ordered certain cases which would deserve individual attention. To this end, therefore, Circular 77, War Department, 1918, was issued about 10 days after the signing of the armistice. This circular provided for the discharge of men who entered the service for the period of the emergency, in whose families there was need or distress, or whose services were urgently needed by some business or industry, provided they were eligible for discharge and could be spared or replaced. To prevent such cases from being arbitrarily decided by subordinate commanders, with possible injustice to the enlisted men concerned, provision was later made for the ruling on all such cases by department or camp commanders, prior to final decision.

While it was not at first to the best interests of demobilization to attempt to discharge a comparatively small number of individuals on their pleas for individual discharge, the War Department was on the alert to modify its instructions the first moment possible, where changing conditions would justify modifications of policy. As the large units in this country whose discharge en bloc could be ordered were demobilized, the time arrived when it was possible to issue

instructions the effect of which was to release men to a larger extent than formerly on their individual application for discharge in cases where definite employment awaited them and it was to the general interest of the country that they should be released. On the other hand, provision was made for retaining in service those soldiers who had no prospect of immediate employment, and Circular 34, War Department, 1919, provided that commanding officers should take steps to insure that every enlisted man in their command understood thoroughly that the War Department did not desire to discharge any soldier who could not secure civilian employment, and that in place of being discharged as he would be normally under orders for demobilization, he might remain in the military service until such time as he could secure employment.

About November 16 instructions were issued specifying in general the order in which various types of organizations should be demobilized. The first were the 71 development battalions in the United States, which embraced a total of 98,199 men. There was also directed the discharge of such conscientious objectors as were not undergoing punishment for mutiny, sedition, disobedience of orders, disloyalty, or other military offenses. There was no further need for continuing in existence the Spruce Production Division, which was engaged in furnishing the raw material for all wooden parts used in the manufacture of aircraft for our own Army and for the armies of our Allies, and in consequence the order for the discharge of the approximately 30,000 men included in its organization was early issued. Provision was made that no more candidates should be admitted to training schools (candidates that so desired were allowed to complete their courses in order that they might qualify for commissions in the Reserve Corps): this, coupled with the suspension of the appointment of more officers, put an effective stop to mobilization of commissioned personnel. It was also directed that the United States Guards, a force of some 30,000 men, be discharged as soon as their services could be spared. The orders further provided that the balance of the Army should be demobilized in the order of railroad troops, depot brigades, replacement camps, and, finally, the combat divisions.

The commanding general of the Expeditionary Forces was directed to designate units to return from over seas as soon as they were no longer needed and transportation could be secured. The War Department recognized that some method must be provided for securing discharge in exceptional circumstances arising in the units overseas as well as in the cases of men in the United States, and therefore authorized Gen. Pershing to send to the United States, for the purpose of immediate discharge, individual men and officers on presentation of convincing testimony to the effect that sickness or other distress existed in their families. Furthermore, he was empowered to discharge in Europe any officer or enlisted man who had entered the service, in Europe, since April 1, 1917, and who submitted sufficient reasons for requesting such discharge.

Demobilization Centers.—In forming the plan for the disbandment of the greater part of the Army, the question of next importance after deciding priority of demobilization and providing for exceptional cases, was by what method and with what machinery

the return of soldiers to civil life could be effected in the most practicable, economical, and expeditious manner.

The system adopted was to establish "demobilization detachments" at certain camps and cantonments throughout the country which were designated as centers for the demobilization of men already stationed at those camps, and to which could be sent men received for discharge from the forces overseas. These organizations were composed of skilled personnel temporarily retained in the service for the operation of the machinery of discharge. This detachment conducted the physical examinations, made up the necessary papers to close all records, checked up property, adjusted financial and other accounts, and, in general, attended to all the many details involved in the process of discharge. Soldiers arriving from overseas were sent for discharge to the demobilization center nearest to their homes.

The process of discharging men from the service was by no means a simple procedure. In order finally to establish the final status of the discharged soldier and to settle his accounts with justice to the individual and to the Government, complete papers and records of various kinds had to be carefully made out in detail. Many men, in their desire to be released from their obligation of service, attempted to conceal physical ailments which, in justice to them and their families, should receive the attention of the Army medical authorities. It was also foreseen that in order to protect the Government from future fraudulent claims for pensions based on disability alleged to have been incurred in the service of the Government, a most thorough physical examination should be given every individual officer and enlisted man. These examinations were conducted at demobilization centers by boards of officers of the Medical Department, each board including in its membership experts in the various medical specialties. At these examinations every defect of any nature found by the examining boards was noted on the individual's record. As a result, these records will always be available for reference and will enable the deciding authority to adjudicate with justice to all concerned. The soldier's pay and allowances due him upon discharge and his final accounts were also computed and paid. This work had to be done carefully and accurately in order to obviate the possibility of working injustice or giving a foundation for future claims. Rights under the war-risk insurance were carefully determined and explained, and where necessary, adjustments were made. On the average, about eight days were consumed from the time of the arrival of the individual man at a port in this country to his arrival at the demobilization center nearest to his home. Men coming to the centers in smaller groups were discharged in an average of 48 hours, whereas for those returning as members of a combat division, this period was sometimes extended a few days.

All of this, of course, required much paper work which could only be properly done by skillful personnel trained in Army procedure. It was at one time proposed that the local draft boards should be used to perform these duties. Had this system been approved, it would have been necessary to provide each one of the 4,648 local boards with the commissioned and enlisted personnel required for the preparation of all papers and with facilities for the

reception, storage, and care of all Government equipment turned in, as well as for the physical examination of the soldiers, the housing and messing, the furnishing of medical attendance and hospital treatment, while the officers and men were awaiting discharge. A further consideration was that shipments from France could not be so regulated as to distribute soldiers for discharge equally over the United States; in consequence, the personnel of draft boards would have been practically idle for long periods of time and overwhelmed with work at other periods.

To meet these problems there was therefore adopted the scheme already described of discharging men at the demobilization centers nearest their point of entry into the service. This resulted in the entire process being conducted through 30 large and well-trained centers which accomplished the work most economically, rapidly, and efficiently.

It was early recognized that a great railroad problem was involved in the transporting of soldiers from Atlantic ports to demobilization centers, and from these centers to their homes. This problem was most satisfactorily solved by the Railroad Administration, which, in addition to efficiently handling the enormously increased travel, also reduced from 3 to 2 cents a mile the fare charged a soldier returning home.

The case of the individual enlisted man.—The system formulated at once after the conclusion of hostilities worked out in the most satisfactory manner. The policy of demobilization by units avoided disrupting the Army as a whole and resulted in returning men to civil life gradually.

The phenomenon of persons crowding into the large cities has occurred in every country that was in the war. There has always been a pronounced tendency for returning soldiers to flock to the cities. Men from farms and rural communities, taken from their homes and shown something of the world, desire to go to the large cities to seek the excitement to be found there. This is a trait of human nature which could not be overcome by legislation or War Department regulations. For a time there was anxiety in many communities lest the soldiers, suddenly released from the restrictions of discipline, might commit excesses. The attitude of the War Department was that those who had been in the service were, as a rule, better men physically, mentally, and morally than they were when they entered the service. It was further maintained that soldiers who can be depended upon to defend their country with their lives should be treated as men worthy to be trusted. The endeavor was therefore made to accomplish the desired result without infringing upon the unquestioned rights of the discharged soldier.

In forming plans for demobilization, the General Staff gave serious consideration to this question. Under existing law, a discharged soldier can not be given transportation in kind but must be paid a travel allowance from the place of discharge to the place of entering the service. In order to encourage the soldier to return to the home community upon his discharge, provisions were made so that the men on receiving their final pay and travel allowances were marched directly to the place where railroad tickets to their homes were obtained. It was further provided that all personnel, morale, and other

officers should cooperate to impress on the men the importance of immediately purchasing railroad transportation, rather than run the risk of losing or squandering their money and thus become a burden upon some near-by community.

The discharged soldier left the Army with his pay plus a \$60 bonus. In health he was in general at least as good as when he entered the service; if wounded or in worse health, he was entitled to compensation. As has already been said no officer or enlisted man was discharged, even on his own desire, until he had received the full benefit of Army medical treatment. Every man was also given a uniform, shoes, and an overcoat or a rain coat. In the case of overseas men, helmets and gas masks were issued as souvenirs. All men who had been fit to take our war-risk insurance were informed of the right to convert it to a five-year term insurance. Furthermore, all were furnished with records of their service. In certain cases, direct vocational training had been given to the men; and in all cases every possible effort was made by the War Department to obtain employment in civil life for ex-soldiers. This latter phase was handled by cooperation with and through the office of a special assistant to the Secretary of War, appointed for this sole purpose.

The accomplishment of these tasks could only be achieved through the cooperation of all branches of the Army. Within the General Staff, the Operations Division (especially the Operations Branch), and the Purchase, Storage and Traffic Division were the ones most occupied in these matters. The Adjutant General was concerned with the proper compilation of the records of the individuals; the Medical Department with the examination of men to be discharged and the care of the great number of wounded, sick, and convalescent soldiers. In addition, every bureau of the War Department was of course also affected and concerned.

The case of the individual officer.—Steps were early taken to secure from all emergency officers a statement as to their own preferences; that is to say, whether they wished immediate discharge, or to be retained in the service with the possible view of their being commissioned in the Regular Army, or if they wished to accept commissions in an enlarged Officers' Reserve Corps. These measures were taken, of course, not only to learn the desires of the temporary officers, but in order that the country should not lose the services of the large reservoir of trained commissioned personnel which they represented.

In general, demobilization of officers proceeded simultaneously with that of the troops, relative proportion being maintained. The methods of payment of officers, the compilation of their records, medical examination, etc., were practically identical with those provided for the enlisted men, except that the officer, should he so desire, had the opportunity to retain, or better, his rank in the Officers' Reserve Corps provided his services had been satisfactory. All officers who had expressed the wish to become a part of the Regular Army, or of the Officers' Reserve Corps, underwent examination to determine their fitness for such commissions.

Until legislation is had defining the future military policy of the country, and fixing the strength of the permanent military establishment, it will, however, be impossible to act finally upon such applications.

Temporary retention of personnel.—In the general eagerness to have immediately discharged the soldiers who had enlisted or been drafted for the emergency, there was a tendency to overlook the fact that after the signing of the armistice there remained much important work for which it was absolutely necessary to compel the retention of some officers and enlisted men until others could be obtained to replace them. There had to be maintained efficient and trained forces to man the ports of debarkation, the convalescent and demobilization centers, the supply depots, the base and general hospitals, and the garrisons along the Mexican border and in our insular possessions, as well as to provide personnel for tasks incident to the transportation and distribution of men and supplies. There were certain soldiers whose services could not be spared; for them the emergency was not over, and loyal and self-sacrificing services were required of them.

It was further necessary, in order to effect the discharge of officers and enlisted men to retain for a time the services of a number of emergency officers. Moreover, the work of the bureaus in disposing of surplus property, closing accounts, etc., also required the temporary retention of many officers. To have discharged these officers, then trained in their own particular duties, would have resulted in the loss of great sums of money and in long delay in disposing of property. Certain branches of the General Staff, such as the Military Intelligence Division, and certain new services, such as the Tank Corps, Chemical Warfare Service, Air Service, etc., were almost wholly composed in their commissioned grades, of officers who had come into the service for the emergency and who could not be at once discharged.

In addition, the work of the Medical Department, of course, did not cease, nor for a long time decrease in volume; there was great need for doctors, the great majority of whom were emergency or temporary officers. It was frequently asked why units of the Regular Army were not assigned such tasks. The explanation lies in the facts that organizations of the Regular Army at the time of the armistice were composed largely of selective service men and those voluntarily enlisted for the period of the emergency; that the original permanent Military Establishment was thinly spread throughout all forces in this country, in Hawaii, Alaska, the Philippines, China, Russia, and in France; and that a majority of the enlisted men of the original Regular Army besides forming a leaven for the entire emergency Army were largely concentrated in the first to eighth Regular Army Divisions, the last to leave France. It is doubtful, moreover, if in the entire Army, 50,000 of the original Regular Army enlisted men remained.

In order not to retain any man in service unless he was indispensable and could in no way be replaced, the hiring of civilians was authorized for such work as they could properly perform. Orders were issued to all commanders to accomplish with the least possible numbers the work which could be done only by soldiers. The War Department on different occasions after the signing of the armistice urged the importance of legislation authorizing the resumption of voluntary enlistments. Finally the act of February 28, 1919, was passed by Congress, and there is now in process an energetic re-

cruiting campaign in which all means at the disposal of the War Department have been used to obtain recruits. Up to June 30, 1919, approximately 67,000 men were secured.

Convalescent centers.—Throughout the entire process of demobilization of men whose services were no longer required, every effort has been made to return the soldier to civil life in a physical condition as good as, or better than, that in which he entered the service. To carry out this policy, every man suffering from wounds, sickness, or physical ailments was not discharged until he had been cured, or until a point of maximum possible improvement had been reached.

The machinery provided for this purpose was the establishment of convalescent centers at the various cantonments. There men whose condition no longer required that they receive hospital treatment were assembled, and under the close supervision of officers of the Medical Department, were given training in various trades, exercises suited for the needs of the individual case, drill, recreation, etc. Convalescent centers have been instrumental in the physical reconstruction of thousands of men. As soon as it was deemed that no further improvement could be made in the physical condition of any man, he was given his discharge and returned to his home. In all convalescent centers, demobilization centers, hospitals, camps, depots, and stations literature concerning the provisions the Government had made for men who had been incapacitated in the service was distributed. All men were fully informed of their rights to compensation and insurance under the war risk insurance act, and to training and the securing of employment under the vocational rehabilitation act.

Demobilization of troops from overseas.—The men of all organizations whose services were no longer required in France could not have been demobilized any faster than they were, since they were brought home as quickly as it was possible to secure shipping for them. The speed with which these forces were returned to the home country is indeed remarkable when it is remembered that it required more than a year and a half to transport these 2,000,000 men and their supplies to France, using all of the ocean tonnage that could be spared from the world's needs. Practically one-half of our troops had been sent abroad in British transports. Since these ships were employed after the armistice in returning British colonial troops to their homes and in readjusting the world's supply of food, they were no longer available for the United States.

At this time the total troop capacity of American transports under the control of the United States was approximately 110,000 men per month. Instructions were therefore given that steps be taken to increase immediately the American transport fleet. How successful were the efforts to accomplish this can best be shown by stating that the troop vessels operating in the service of returning the American forces from overseas debarked 333,333 men in May of 1919, and 342,816 men in June. The increase in the number of ships which made possible the achievements of these two typical months, was brought about in several ways. Some 58 cargo transports were altered and converted into troop ships; the Navy assigned some battle-ships and cruisers to augment the transport service; 10 large passen-

ger ships originally belonging to the German Empire were obtained and promptly equipped for carrying American troops. In addition, the War Department was successful in negotiating with the Italian, French, Spanish, and Dutch Governments for the utilization of suitable passenger vessels of their fleets. There has been no problem before the War Department that has received more prompt attention than the return of the American forces from France. Every effort was made to expedite the fitting out, repair, and "turn around" of troop transports. A number of the faster vessels in the transport fleet have been able to land their cargo of American troops twice during the same month.

It is estimated that as the result of the steps outlined above to expedite in every possible way the return, and hence the demobilization, of our overseas forces, a saving was made of approximately \$60,000,000 to the Government over the original estimate made as to the cost of the demobilization.

Parades.—In routing organizations from the ports of embarkation to demobilization centers, every reasonable effort was made to permit the maximum number of people possible to extend to the returning organizations the welcomes to which they were entitled. In order to permit units not larger than a regiment to stop at important cities en route to demobilization centers, the following general principles were early approved: (a) That every effort should be made to permit troops coming from a particular city to hold parades in that city; (b) that as many cities as possible should be permitted to have troops stop off for parade purposes; (c) that the schedules should be arranged to insure a fair distribution of troops.

The War Department being in possession of information showing the localities from which all troops came, the Operations Branch of the Operations Division was enabled to make an assignment of troops to their own localities. Practically every request, except for some parades of divisions, was complied with and by June 30, over 500 parades of regiments or similar organizations had taken place while troops were en route to demobilization camps. Division parades were arranged for the Seventy-seventh, Twenty-sixth, Twenty-seventh and Twenty-eighth Divisions. Railroad equipment necessary to move troops in comfort was so limited that it was necessary to reduce the number of stops to a minimum. It should be remembered that half of the tourist equipment available within the United States is required to move one division, and that as no division could arrive en bloc at the ports, the first organizations to arrive might be held several days waiting for other ships to bring in the remaining units for parades. It was necessary to so arrange equipment that smaller detachments of troops, which were seldom accorded the welcome arranged for organized units, should not receive inferior equipment, and be forced to travel overnight in day coaches. Stops of any length for parades or receptions caused delays of 24 hours. A second consideration was that there was a widespread feeling among the men and their families against anything which postponed their arrival at their homes, and the War Department therefore desired that discharges should not be unduly delayed for parade purposes.

Statistics.—In concluding this account of the demobilization of personnel of the emergency army, it may be of interest to include some statistics. In comparing our demobilization with that of our Allies, it must be remembered that to demobilize the American Expeditionary Forces it was necessary to bring the men back across 3,000 miles of sea, while the French troops to be demobilized were already at home, and the British troops (except colonials) had only a short trip to make across the English Channel. The demobilization of troops which had not left the United States was also dependent to a considerable extent upon the return of troops from overseas, since many men had to be retained in the service here until the army from overseas had returned.

On January 4 the United States had demobilized 732,766 troops, while on January 3 Great Britain had demobilized 316,531. By February 1 the American and British troops discharged were approximately equal, 1,026,664 for the United States and 1,112,339 for Great Britain; after this date the British troops were demobilized faster than those of the United States.

On May 1 the United States had discharged 1,936,011 troops, while France, with no sea transportation involved, returned to the reserve 2,268,000, in addition to 600,000 enlisted men serving in factories engaged in production of war material and supplies.

COMPARATIVE STATISTICS IN THE DEMOBILIZATION OF THE UNITED STATES MILITARY FORCES AT THE CLOSE OF THE CIVIL WAR, THE WAR WITH SPAIN, AND THE PRESENT WAR.

Civil War.—The Volunteer Army of the United States (Regulars not included) reached its greatest strength on April 30, 1865, on which date it included 1,034,064 officers and men. The number of Regulars in service on that date has been computed at 26,898 officers and men. The Volunteers were not all mustered out at one time, but their numbers were gradually reduced from time to time, beginning May 1, 1865, following the surrender of the Confederate armies. The following statement shows the number of Volunteers mustered out and returned to their homes between certain specified dates:

Period.	Number of officers and men mustered out.	Cumulative.	Period.	Number of officers and men mustered out.	Cumulative.
1865.			1866.		
May 1 to Aug. 7.....	640,806	640,806	Jan. 21 to Feb. 15.....	33,730	952,452
Aug. 8 to Aug. 22.....	78,532	719,338	Feb. 16 to Mar. 10.....	15,435	967,887
Aug. 23 to Sept. 14.....	21,769	741,107	Mar. 11 to May 1.....	18,895	986,782
Sept. 15 to Oct. 15.....	44,098	785,205	May 2 to June 30.....	23,888	1,010,670
Oct. 16 to Nov. 15.....	15,758	800,963	July 1 to Nov. 1.....	12,351	1,023,021
Nov. 16 to Jan. 20.....	117,759	918,722			

A few volunteers were retained in service for special reasons after November 1, 1866. The last volunteer organization was disbanded December 30, 1867.

War with Spain.—The Volunteer Army (Regulars not included) reached its greatest strength on August 31, 1898, on which date it included 8,895 officers and 207,361 enlisted men, a total of 216,256 officers and men. On that date there were 2,323 officers and 54,039 enlisted men in the Regular Army, a total of 56,362 officers and men. The mustering out of the Volunteer forces which served in the Cuban and Porto Rican campaigns, or which were in training in the United States preparatory to service in these campaigns, began on September 5, 1898, the protocol having been signed on August 12, 1898, and terminated

on June 22, 1899. The following statement shows the number of officers and men of the Volunteer Army mustered out during each month of that period:

	Monthly.			Cumulative.		
	Officers.	Men.	Total.	Officers.	Men.	Total.
1898.						
September.....	98	2,238	2,336	98	2,238	2,336
October.....	1,415	35,060	36,475	1,513	37,298	38,811
November.....	1,884	45,478	47,362	3,397	82,776	85,173
December.....	507	12,426	12,923	3,904	95,192	99,096
1899.

¹ Includes 46 officers and 1,216 enlisted men mustered out Feb. 20 to 26, 1899, in the Hawaiian Islands.

A number of volunteer organizations were held in service after June 22, 1899, for duty in the Philippine Islands during the insurrection. The last volunteer organization was mustered out on November 23, 1899.

War with Germany.—The United States Army reached its greatest strength on November 11, 1918, the date on which the armistice was signed. Its strength on that date has been computed at 188,434 officers and 3,482,454 men, a total of 3,670,888 officers and men. Demobilization was begun immediately after the armistice was signed, and reports received show that 127,160 officers and 2,596,355 men, or a total of 2,723,515 officers and men, had been discharged from service up to and including June 28, 1919. The following statement shows the number of officers and men discharged during each week of the period:

Week ended—	Weekly.			Cumulative.		
	Officers.	Men.	Total.	Officers.	Men.	Total.
1918.

As the result of corrections recently received the number of officers discharged since November 11, 1918, has been reduced by 2,260. This number has been deducted from the cumulative total for June 28.

It appears from a comparison of the figures in the above statements that a total of 640,806 officers and men were mustered out of service at the close of the Civil War between May 1, 1865, and August 7, 1865, a period of three months and one week; while a total of 1,246,374 officers and men were discharged from service between the signing of the armistice on November 11, 1918, and February 15, 1919, a period of three months and four days. Nearly twice as many discharges from service were thus effected during the present demobilization as during an equal period at the close of the Civil War. It is also to be noted that 63,643 more officers and men were discharged from service between November 11, 1918, and February 1, 1919 (a period of 2 months and 21 days), than were mustered out during the entire period of demobilization (1 year and 5 months) at the close of the Civil War. While it is true that the Army now being demobilized was more than three and one-half times as large as was the Union Army on April 30, 1865; nevertheless, taking into account the unsettled conditions prevailing in Europe subsequent to the signing of the armistice and the fact that the greater part of the Army had to be transported thousands of miles across the ocean before discharge, it appears that the rate of demobilization has been, both comparatively and actually, very high.

In spite of a few individual complaints, evidence from many different sources from every part of the country shows clearly and unmistakably that the best interests of the country as a whole have been safeguarded, and that fairness and equal treatment to the individuals in the Army have been secured by the system of demobilization.

The system formulated at once after the conclusion of hostilities worked out most expeditiously and satisfactorily. The determining principle throughout demobilization was that all of our soldiers whose services were no longer needed were entitled to discharge.

DISPOSAL OF PROPERTY.

The signing of the armistice resulted in the immediate direction of all activities of the supply system into new channels. It suddenly became necessary to properly dispose of millions of dollars worth of war contracts which were to be terminated and adjusted. Vast parcels of real estate which had been rented or otherwise acquired by the War Department awaited disposition. Incident to the undertakings of the War Department had been the arising of many claims of various sorts which now pressed for settlement; great quantities of war stocks and of raw material, the accumulation of which had been necessary to secure present and future supplies for the large emergency Army, were suddenly rendered surplus; it was necessary to completely reverse the processes of embarkation and shipment, except for the supplies still needed overseas. In addition to all these matters, the General Staff was confronted with the whole question of peace-time organization of the supply system of the Army, with all its attendant phases of procurement, calculation of requirements, standardization of material, storage, distribution, and transportation.

Cessation of production and terms of contracts.—The stoppage of the manufacture of war material, while somewhat analagous to the demobilization of men, involved many more complex considerations and problems. The latter could be effected by military orders; the former, however, was less an Army and more a national problem. Due to the labor situation, the demobilization of industrial organizations could not be effected immediately or simultaneously. It was obviously necessary that the production of some supplies must be continued and brought to a close gradually. There were involved in these questions the financial interests of industry to the extent of millions of dollars and there was thus made necessary the making up of a very delicate and comprehensive method of settlement. There were involved decisions concerning the types of supplies whose production might be continued for use as reserve stocks (such as ordnance, etc.) and the exact amount in which such material should continue to be produced. Another phase was that the manufacturer who had in good faith undertaken the production of supplies must in justice be allowed to continue, temporarily, the production of certain types of articles in order that he might avoid financial loss. The selection of types which, however, could be so continued was a matter in which the interests of the Government were intimately involved. There were also to be devolved exact methods for settling contracts and for making final payments and adjustments. Furthermore, the disposal by sale of surplus supplies could only be effected through the up-building of well thought-out methods.

Designation of surpluses and provision of reserves.—Immediately on the signing of the armistice, a study of the situation was made by the Equipment Branch in order to give the supply departments a basis for the cancellation of contracts and for the disposition of surplus stores. Instructions were sent them to retain on hand what would be necessary for the troops still in the American Expeditionary Forces, initial equipment for one complete army of 1,500,000 men plus 100 per cent, and also one year's supply for a force of one-half million men. This was, of course, only a temporary measure designed to enable the supply departments to cancel contracts and dispose of surplus stores, and it was specially intended that there should be a great margin of safety in order to avoid a possible shortage should the armistice prove short lived.

With the thought that the heart of the whole problem lay in proper designation of surpluses and provision of reserves, it was deemed advisable to create a reserve for war purposes in the Army, in an attempt to avoid a repetition of the serious lack of material existing upon the outbreak of this war. In the absence of legislation, it was considered that an organization consisting of one complete army of 20 Infantry divisions, 1 Cavalry division, and the necessary miscellaneous and overhead troops should be provided for in the case of another war. This totaled 1,447,000, and it was decided that equipment should be kept on hand to provide the full amount required to keep and maintain the peace-time army which, in the absence of action by Congress, was tentatively fixed at 500,000 men. This figure will, of course, automatically change at any time that Congress may take final action.

Obviously equipment and supplies that can be obtained in the open market do not need to be kept on hand in any quantities to provide

for an emergency. Field guns, however, and artillery of all kinds require at least one year to manufacture, and therefore, if the country is to be properly prepared for a war emergency, considerable quantities must be retained to take care of the necessary expansion of the peace army into one for war. All supplies were therefore divided into four classes: First, those which could be obtained in the open market within 30 days, and of this class there was to be no war reserve; second, supplies which required more than 30 days and less than 6 months to procure, of this class sufficient should be kept on hand to expand the peace army into the war army, giving a complete initial equipment; third, supplies requiring over six months and less than a year to procure, of which it was decided to retain an amount sufficient to maintain the war army for 6 months, and, finally supplies requiring over one year, which should be retained in sufficient quantities to maintain the war army for one year. All material on hand, in excess of these quantities, was ordered sold.

The establishment of this war reserve is a matter of great importance for the Army and for the country. It will avoid the serious troubles in equipping troops which occurred at the outbreak of this war, and will give the supply departments the necessary time to prepare for production in case of war.

Adjustment of contracts and claims.—One of the problems requiring immediate attention was the termination and adjustment of contracts under the provisions of which the war industries of the country were manufacturing supplies with abnormal activity. On November 11 work was under way on a large number of contracts and, in many cases, in anticipation of the signing of formal contracts. Reduction of expenditures without undue sacrifice of material already partly prepared, and, without disorganization of industry, was, of course, desired. To accomplish this, it was necessary to consider all contracts individually or in small groups, in order to decide whether it was advisable to allow the contract to be completed in full, or if not, to determine at what point it should be suspended. Guiding considerations in such cases were the degree of completion of articles under manufacture, the value of the material if completed for peace purposes or for the future Army program, and the claims of the contractors for damages. In addition to contracts which were allowed to run their full course, 25,196 contracts and agreements were suspended at various stages of completion, and have been liquidated or are to be liquidated. Such liquidation involves a careful determination of all expenses and obligations actually incurred by the contractor for materials, labor, plant facilities, subcontractors, etc., in accordance with the terms of the contract. In cases where no contract had been signed the problem was even more difficult, in that it involved a determination of what expenses had actually been authorized.

In the making and fulfilling of contracts, obviously, and in spite of the most scrupulous care and desire to render full justice to all concerned, many claims and disputes were bound to arise.

Omitting from consideration the value of all material actually delivered before or after the armistice, the value of the incompleting portions of these 25,196 contracts and agreements is estimated to have been \$3,775,000,000. Of this total, 18,318 contracts and agreements

of a value of \$1,483,800,000 had been liquidated to June 30, 1919. Of this value, 13.8 per cent was paid to the contractor in settlement costs.

Sale of surplus property and real estate.—At the termination of hostilities the War Department was confronted not only with a large number of contracts for the production of war supplies, but found on its hands enormous quantities of surplus property. This consisted of every variety of material used for the equipment and supply of an army in the field, materials for the manufacture of munitions, machinery used in manufacture, complete cities created to manufacture munitions, buildings and building material, wharves, railroads, railroad equipment, shipping, and land.

The condition of this property varied greatly. The principal classes into which property, other than real estate and buildings, was divided on a basis of its condition were, scrap, unserviceable but reclaimable, used but serviceable, new in stock, in process of manufacture, and on order but not yet in production. It was located in the United States, France, Italy, Canada, Chile, and Germany.

The problem involved not merely the sale of this surplus property, but also deciding in thousands of cases what portion should be declared surplus and what kept for immediate or future use. Neither portion of the task is yet completed. Final decisions on the amounts of many articles to be sold as surplus await the adoption by Congress of a definite program regarding the size of the Army and the extent of military training. It has been roughly estimated that the property in the United States which will ultimately be declared surplus has a cost value of approximately \$2,000,000,000. Of this, property costing about \$700,000,000 had been sold to the end of August, 1919, for about \$530,000,000, or 77 per cent of the cost. Surplus property in France has been estimated to have cost about \$1,250,000,000. The greater part of it has been sold to the French Government for \$400,000,000 and most of the remainder has been disposed of to various purchasers for nearly \$100,000,000. While this represents a much smaller percentage of recovery than was obtained for the property thus far sold in this country, it is considered very satisfactory in view of the fact that a much smaller proportion was new material and a much greater proportion was in the nature of fixed improvements, such as wharves, buildings, and railroads. Much of the latter class of property has little value for peace-time uses as located, and almost no salvage value for removal. The estimated cost of the property which the Army in Germany will have for sale is \$132,000,000.

A considerable amount of the surplus property in the United States will be disposed of by authority of Congress by transfer to other Government departments. The value of property to be ultimately so disposed of will probably approach \$100,000,000.

Just as the Operations Division of the General Staff was charged chiefly with the demobilization of the personnel of the Army, so has the Purchase, Storage and Traffic Division been charged chiefly with the disposal of surplus material, supplies, and real estate, and the organization developed for this purpose and the general procedure followed is outlined elsewhere in this report in connection with the account of the activities of that division.

VIII. MISCELLANEOUS ACTIVITIES OF THE ARMY DURING THE WAR.

The foregoing portion of this report has been concerned chiefly with the activities, during the war, of the War Department and of the General Staff, relating especially to the mobilization, organization, training, equipping, and transporting of the forces for the American Expeditionary Force in France.

An account of the work of the Army during this period, however, would be incomplete without reference to other arduous and important duties with which it has been charged, and I desire to make special mention in this connection of the work of the American Expeditionary Force in Siberia and of that of the troops on border duty in this country.

Nonintervention in Russia.—During the progress of the war, and especially after the collapse of the Russian Government and the consequent elimination of the Russian Army as an active factor in the maintenance of military operations against the Central Powers from the east, the suggestion was received by the department, from time to time, from many sources that this country participate in an armed intervention in Russia with the view of restoring order and a strong and stable government and of enabling, by our assistance, the Russian army to be reconstituted and utilized in a renewal of offensive operations on an enlarged scale against the German eastern front. This matter was given careful consideration by the department, but a thorough study of it in all its phases, including the transportation and other problems involved in the transporting and in the maintenance from this country of a force of effective size on the eastern front, showed that such action would be inadvisable. Furthermore, sound military policy demanded that all the energy and facilities of this country should be devoted, without cessation or interference, to the winning of the war on the western front, and it was decided that, with this purpose constantly in mind, any considerable diversion or dissipation of our forces, for the purpose of organizing an army of intervention in Russia or for any other purpose, would be entirely unwarranted.

American Expeditionary Force in Siberia.—While this policy was adhered to, it was later decided to send a relatively small force of American troops to Siberia for other special reasons. The decision to send a small expeditionary force to Vladivostok, which was announced in August, 1918, was arrived at after a careful consideration of the entire situation by the representatives of the Allied and Associated Powers. The plans and purposes of the United States in taking this action were made public at the time. They contemplated that this force should be utilized to render such protection and help as was possible to the Czecho-Slovaks against the armed Austrian and German prisoners who were attacking them, to safeguard as far as it might the country to the rear of the westward-moving Czecho-Slovaks, and to guard military stores which might later be needed by Russian troops, against capture or against destruction by German agents. In addition to these functions, which were essentially of a military significance, it was the purpose of this force to protect, and to assist in forwarding, large quantities of supplies which the Russian

authorities in this country has succeeded in shipping to Siberia. The resources of that country had been almost exhausted by the chaotic conditions existing there; the inhabitants, including the women and children, had practically no shoes or warm clothing, and had little food; there was great need of agricultural implements and of many of the articles of commerce which are essential to fruitful industry.

In order to do this, it was necessary to keep open, and to assist in the operation of, the Siberian Railroad, which was not only the main artery for transportation in Siberia, but was the only access open to European Russia. Partisan bands having no connection with any organized government, under transitory leaders giving allegiance to no authority, were constantly menacing the operation of the railway and the safety of its permanent structures.

Mr. John F. Stevens, in response to a request of the Provisional Government of Russia, had gone to Russia in the spring of 1917, and had been made official adviser to the Minister of Ways and Communications. The Russian Railway Service Corps, composed of American engineers, had also been organized by the Department of State. But, due to the Bolshevik uprising and general chaotic conditions, neither Mr. Stevens nor the Russian Railway Service Corps had been able to begin work in Siberia until March, 1918. It became apparent that under the existing conditions it would be impracticable for Mr. Stevens and the Russian Railway Service Corps to undertake the arduous task confronting them without the support of troops. The United States and Japan were the only two powers at the time in a position to act in Siberia in sufficient force to accomplish these desired ends, and it was jointly agreed between these two countries, with the approval of the Governments of Great Britain, France, and Italy, that each should send a few thousand men to Vladivostok for the purpose referred to, it being announced publicly by this Government that this action contemplated no interference with the political sovereignty of Russia and no intervention in her internal affairs, even in the local affairs of the limited areas to be occupied by our military force.

The War Department accordingly ordered to Siberia, for the reasons indicated, an expedition of a little less than 10,000 troops, under command of Maj. Gen. William S. Graves, which began arriving at Vladivostok in September, 1918. This expedition consisted of the Twenty-seventh and Thirty-first Infantry, from the Philippine Islands, and of Ambulance Company No. 4, Field Hospital No. 4, Evacuation Hospital No. 17, Service Park Unit No. 333 of the Motor Transport Corps, Depot Company No. 146 of the Ordnance Department, Company D, Fifty-third Telegraph Battalion, Signal Corps, and a detachment of engineers. To bring this force up to war strength about 5,000 men were sent from the United States. The immediate result was the successful reunion of the separated Czecho-Slovak armies and the substantial elimination in eastern Siberia of the active efforts of enemy prisoners of war. A period of relative quiet ensued and it became practicable to resume railway service.

A definite plan covering the supervision of the Chinese Eastern and Trans-Siberian Railways was arrived at in February, 1919, by

an agreement between the United States and Japan which provided that under an interallied committee with a Russian as chairman the technical and economic management of these railways was to be charged to a technical board of which Mr. Stevens was elected president, that the protection of the railways was to be placed under the allied military forces, and that each Government should give to Mr. Stevens the authority and the support necessary to make his efforts effective, it being understood that this plan was to be interpreted as a sincere effort to join these railways in the interest of the Russian people with the view toward their ultimate return without the impairment of any existing rights. The instructions to Gen. Graves directed him not to interfere in Russian affairs and also directed him to cooperate with Mr. Stevens and to take such action as might be necessary to give authority and support to him in the performance of his duties as president of the technical board to operate the railways.

The small force of approximately 5,000 which was in August and September, 1918, sent to Archangel to cooperate with the British and the French troops in the protection of valuable military stores, and in the guarding of the railway lines to Murmansk and Archangel, was withdrawn in June and in August, 1919. It constituted a part of the command of the commanding general of the American Expeditionary Forces in France and its work will doubtless be covered in his report.

Included in our expeditionary force under Gen. Graves were approximately 5,000 men who were enlisted or drafted for the period of the emergency. Soon after Congress authorized the resumption of voluntary enlistments on February 28, 1919, recruiting of men who desired service in Siberia was begun. The shipment of these men to Vladivostok to replace the emergency men was begun in June, 1919, and it is expected that all emergency men will have been replaced before another winter sets in.

Gen. Graves has been confronted with a trying and difficult situation. Eight thousand miles from his home Government; surrounded by ambitious commanders of many nationalities; and confronted by a people made desperate by want, cold and hunger, embittered by years of war and suffering, and subject to the influences of the most unprincipled agitators; with first one faction in control and then another; it has required great tact, firmness and good judgment to steer a straight and impartial course. He and his command have performed a difficult and arduous task with credit to themselves and to the country.

Troops on border duty.—During the progress of the war in Europe the work of the United States Army in protecting our southern border received a comparatively small share of the public attention and the importance of this work was not generally understood. The duties performed included patrolling the border in order to prevent bandits from crossing the international line and from making raids into the United States and committing depredations against the lives and property of United States citizens. While it was not practicable to maintain a continuous guard along the entire border, the border troops were distributed in such a way that information concerning raids might be acted upon with sufficient promptness to

minimize the dangers therefrom. The necessarily wide distribution of the border patrol and an entire absence of Mexican guards along wide stretches of the frontier, especially in the rough and sparsely settled frontier country rendered especially difficult the furnishing of adequate protection to our citizens and necessitated constant patrolling and, on occasions, the vigorous pursuit of bandits raiding on the American side of the Rio Grande.

An important duty of the United States troops along the border, during the part of active warfare against Germany, was to prevent unauthorized persons from crossing the border, and to require all crossings to be made at regularly established ports of entry. In view of the political situation persons crossing or attempting to cross at unauthorized places put themselves under suspicion as being bandits, guerillas, ammunition smugglers, violators of the neutrality law, spies, and German sympathizers or their agents. The established ports of entry were entirely in the hands of civilian officers with whom the military forces cooperated in every way practicable.

The officers and enlisted men of the Army on border duty were active in enforcing the embargo on shipment of arms and munitions of war to Mexico, which was declared in the proclamation of the President on October 9, 1915, and they were of material assistance to the civil authorities in preventing the violation of its terms. The troops also assisted in maintaining the censorship during the war and in preventing the transmission of important military information across our southern border to find its way ultimately to the German Government.

The necessity of preventing rival Mexican factions engaged in fighting each other near the boundary line from firing across our border and endangering the lives of American citizens in their homes, and the duty of the United States to preserve its neutrality and to intern any Mexican forces driven across the boundary line into the United States by a rival faction also demanded the constant watchfulness of our troops. It was, furthermore, necessary to guard important railway bridges, irrigating dams and reservoirs, and certain manufacturing plants near the border against possible attempts at destruction by German agents and sympathizers. Owing to the great length of our southern land boundary, it took considerable numbers of troops to patrol it. On May 4, 1918, the border patrol garrisons consisted of the equivalent of nine regiments of Cavalry, seven and one-third regiments of Infantry (including the Fourteenth Infantry Brigade), 1 regiment and 1 battalion of Field Artillery, 2 mounted battalions of Engineers, and 1 Field Signal battalion and 3,260 Infantry recruits under orders, total, 31,500 men. The following line organizations performed border duty throughout the entire period, or during the major portion of the World War: Infantry—Third, Nineteenth, Twenty-fourth, Twenty-fifth, Thirty-fifth, Thirty-seventh, Fifty-seventh Regiments; Cavalry—First, Fourth, Fifth, Seventh, Eighth, Tenth, Eleventh, Twelfth, Thirteenth, Fourteenth, Sixteenth, and Seventeenth Regiments; Field Artillery—Fourth and Eighty-second Regiments. The Sixty-fourth Infantry and Third Field Artillery performed border duty for a considerable period prior to being sent overseas. There were other organizations also stationed on the border for shorter periods which are not enumerated in the above lists.

This work required many small and isolated detachments, the patrols from which were continually exposed to ambush and attack from bandits. Its nature was such as to render it, to an exceptional degree, both arduous and dangerous. The efficient and faithful services of the officers and enlisted men charged with its performance under most trying conditions merit the highest commendation.

IX. CONCLUSION.

LESSONS OF THE WAR.

The lessons of this war are many and important. Probably no great industry or activity exists in the country which has not gained, during the mobilization of the resources of the Nation which was accomplished during the war, experience which, when analyzed and studied, will be of great and lasting benefit to it and to the Nation. Undoubtedly the country has incurred much expense, and has lost many lives on account of the improvisations which were inevitable on account of its lack of preparedness for war, and it is essential that the lessons which have crystallized out of the experience of the War Department, as of the other great agencies directly concerned in the war, be heeded and profited by if this tremendous toll of wealth and of life is not to have been in vain.

In the preceding pages of this report there have been outlined some of the steps in the evolution and development of the organization and of the methods used in planning and in executing the military program, including the organizing, training, transporting, and supplying of the Army. This development has been gradual; each step has taught its lesson, and the lesson should not require repetition in any future war.

Before the war the theory was frequently advanced that future wars would, due to the terrible efficiency of modern instruments of warfare, be short and decisive. In this war the scientific and technical skill of the world has been concentrated for four years on the problems of devising either new death-dealing devices or means of protection against them. The history of the war, however, has shown that this theory is untenable. It has shown that, on the contrary, a modern war is a war of nations rather than of armies; that it involves a mobilization of the entire resources of these nations, and that it will, therefore, require for its decision a length of time not incomparable with that of previous wars.

Necessity for General Staff control.—This consideration accentuates the necessity, already referred to in this report, of a War Department organization in future which is adequate to the efficient formulation and execution of a military program which will require a definite and effective articulation of the War Department with all the agencies involved in the mobilization of the industries, activities, utilities, and resources of the Nation. I have set forth in this report the fundamental principles upon which, in my opinion, such an organization must be based. I am convinced that without a properly organized and efficient General Staff charged with the responsibility for, and empowered with the authority to formulate and to execute, the Army program, it will, in any future war, as in

this and in every other war in our history, be impossible for the activities of the various agencies, services, and bureaus of the War Department to be controlled and directed, with promptness and effectiveness, to the attainment of the common end. It can be stated without qualification that the success of an army in modern war is impossible without such a General Staff.

Under the terms of the treaty of peace, the German general staff is abolished. Had the Germans won the war they would, in all probability, have prescribed somewhat similar terms for the United States. It was necessary that the legislative restrictions hitherto imposed upon the organization and activities of the General Staff be removed, upon the declaration of war, in order that the military program might be carried out, and the Army organized, trained, and commanded with the expedition and the efficiency that the country demanded. Unless these restrictions are permanently removed and the General Staff is established upon a proper basis, the experience gained during this war will have been largely without avail, restrictions not incomparable with those that might have been expected from a German victor will have been imposed upon the General Staff, and it is inevitable that a future war will find this country as unprepared as it was for this war—with consequences which may endanger the Nation.

Necessity for reserves of clothing and equipment.—On the declaration of war the mobilization and the training of the Army suffered inevitable and serious delay due to the lack of an adequate reserve supply of winter clothing and other equipage and equipment required for training, which could not be manufactured in a short time. It was necessary to improvise this equipment. It became necessary to send to France entire brigades of Artillery with such meager and totally inadequate training as could be gained from drill with wooden logs mounted on ash carts. It should never be necessary for this lesson as to the necessity for an adequate reserve of material to be learned again. Fortunately, it will be practicable, from the tremendous amounts of material of all kinds that were coming into quantity production on the signing of the armistice, four years after the beginning of the war, and a year and a half after our entry into it, to make reasonable provision in this regard for the future.

Supply and training of officers and replacements.—Reference has also been made to the necessity of making adequate and special provision in any future contingency for the organization and training, in the early stages of mobilization, of officers, and of replacements and special troops. In this war it was necessary to train approximately 180,000 officers who had had little, if any, previous military training. The Regular Army consisted of less than 6,000 officers, of whom more than 1,000 had less than two years' service. It was necessary to use a large number of these trained officers for the various staff and other duties required to mobilize the Army; the training of the officers and men required for the new Army could not, for months, be effective. There can be no avoiding a recurrence of this situation except to provide an adequate reserve of trained officers and men.

Due to our lack of preparedness, the execution of our military program necessitated the sending to France and into battle of some organizations and replacements without proper training; undoubtedly the lack of proper equipment and instructors for training re-

sulted, in some cases, in a loss of lives that might have been avoided with well trained and disciplined officers and men. This action was taken only because of the firm conviction that it was imperative. There was no alternative if the war was to be won without a prolonged struggle resulting in an aggregate loss of life far exceeding that which actually occurred. The disadvantages were great and were fully considered. Events have proved that they were the price of victory. It is a price that it should never be necessary to pay again.

The war has taught many lessons; the principles of warfare, however, remain unchanged. It was not won, as some had predicted it would be, by some new and terrible development or modern science; it was won, as has every other war in history, by men, munitions, and morale.

Viewed as a whole it has many of the characteristics of a single great battle. Like a battle it began with a period of maneuvering for position, which developed into a period of close contact and attrition, and like a battle it terminated in a short period of decision in which the victory was won by an offensive operation which, by the utilization of a strong and effective reserve, became overwhelming in its effect. It differs from any previous battle chiefly in the magnitude of the forces, material, and time involved. With the entire man power and resources of great nations mobilized and engaged the period of contact and attrition occupied years instead of hours or days as in previous battles. Only the determination, the valor, and the sacrifices of our allies throughout this terrible period of ordeal by battle made it possible for us to furnish the final reserve which, with its impetuous vigor and its irresistible force, enabled the allied army to pass from the defensive to the offensive and made possible an early and decisive victory.

Development of special services.—The changes in warfare as the result of this war are in its practice only and not its principles. These changes have been, to a large degree, due to the development of the numerous and important special services which have been made necessary as the result of the concentration of the best technical and military skill of the world upon the application to military purposes of the most recent engineering and scientific developments. The remarkable development in aeroplanes, tanks, motor transport, railroad artillery, caterpillars, trench mortars, machine guns, gas warfare, radio and sound and flash ranging apparatus, and photography have modified in many respects the details and conditions of warfare, and have made possible operations of an unprecedented magnitude. In the Meuse-Argonne Battle the American expenditure of artillery ammunition is estimated at more than 4,000,000 rounds; in the battle of Gettysburg, the Union Army expended less than 40,000 rounds. Thus the development of motor transport has rendered practicable expenditures of artillery and machine-gun ammunition in amounts practically limited only by the production and transportation capacity of the country. In all of these developments the contribution of the American engineers has been conspicuous; the Liberty 12-cylinder aeroplane engine, the Browning machine gun, and the American gas-warfare equipment are noteworthy examples.

Important as has been the effect of these mechanical developments and special services, their true value has been as auxiliaries to

the Infantry. Nothing in this war has changed the fact that it is now, as always heretofore, the Infantry with rifle and bayonet that, in the final analysis, must bear the brunt of the assault and carry it on to victory. The war has taught the necessity of the appreciation by all officers of the interdependence of all arms of the service in battle. They are to fight together; they must be trained and taught together if the common knowledge of the powers and limitations of each arm, and the mutual confidence, without which efficient teamwork in battle is impossible, is to be attained.

Necessity for combined tactical training in large units.—The important lesson to be learned in this connection is that a reasonable efficiency in peace time training for war can never be secured until the present system of small, isolated battalion and company posts, which is a relic of the days of Indian fighting, is replaced by a system which enables entire divisions to be trained together and to be consolidated frequently for the maneuvers of larger units. By such a system only can commanding, staff, and line officers be developed and trained for the duties they will have to perform in modern warfare. That this is true has long been recognized by the responsible military authorities. For the first time in our history conditions now permit of its accomplishment; no one thing is more essential to the future efficiency of the military establishment than that this opportunity be taken advantage of.

The war has shown that the American ideas of the training of the soldier were sound and that the American-trained soldier has no superior. It has also shown that the principles underlying the instruction in our service schools for officers are sound. The results attained both in staff work and in the command and leading of troops in combat are remarkable, in view of the fact that opportunities for the training of officers in the actual command of, or in the actual performance of staff duties in, divisions and larger units have prior to this war been practically nonexistent. These results are largely attributable to the instruction given in the various service schools before the war, and they have emphasized the necessity for the continuation and development of these schools in the future.

As the result of the war the Army has many problems that must be solved. For every branch of the service there are questions of organization, equipment, and training. These are largely matters of detail which will involve a careful and well-considered study of the experience gained both in this country and overseas. These studies are already well under way. They will require much time and consideration for their preparation; there is no urgent necessity for their early completion.

There are, however, larger problems of the organization of the Army as a whole, affecting to a vital degree its efficiency, which press for early action.

There are also problems arising from the experience of the war which affect the military policy of the Nation itself.

Military policy as effected by the war.—The idea that a force of one and one-half million men could be transported within six months 3,000 miles across a submarine-infested ocean and there maintained was one unconceived of not only in our own war plans but in those of any other country. Perhaps no lesson of the war has been of more universal interest. We are not alone in having

learned it; it is one that must inevitably affect to a material degree all future military plans, both offensive and defensive, throughout the world.

At the beginning of the war this country occupied a position apart in world affairs. This position but reflected its geographical isolation from the continental great powers. As the result of the war, however, the position of this country has, in many important respects, undergone marked changes of far-reaching effect. Its geographical position, upon which it has long relied largely for its military defense, may no longer be regarded as isolated from the military operations of any possible powerful enemy. Its present international position must be recognized as being attended by tremendously increased responsibilities.

Our former position, international and geographical, had resulted in a long-continued national policy which precluded the adoption of a military policy upon which the country could depend with safety in time of war. It entered the war, therefore, practically unprepared for war. Its military power consisted almost entirely of its potential resources of man power, wealth, and munitions. These resources, while inexhaustible, were undeveloped and unavailable—to such a degree that the enemy considered it impossible for them to be rendered effective in time to permit the participation of the United States to become a potent factor in the prosecution of the war.

The national mobilization of these resources, including the complete and successful diversion to essential war work of practically every industry and activity of the country, between April 6, 1917, and November 11, 1918, rendered the participation of this country a decisive factor in the winning of the war for civilization and constitutes a national achievement of which we may well be proud. It is essential, however, that consideration be given to the fact that this mobilization of our resources, and this achievement, required a year and a half for its accomplishment and that it was possible only due to the extraordinary and unprecedented conditions that obtained during that period. It was possible for us to create, organize, train, equip, and transport an army, and to direct all of the activities of the Nation to its support and maintenance, only because of the assistance of our Allies, especially in supplying tonnage and equipment and in rendering available to us all the results of three years' experience in the war, and only because of the fact that by their heroic efforts and sacrifices, on land and sea, they protected us during this period of one and one-half years from the ruthlessness of the common enemy. Surely we can never expect to prepare for defense against the attack of a powerful and determined enemy again under such favorable conditions to ourselves.

The war has shown that this country can, in an emergency, be self-sustaining in all respects for an indefinite period. This is probably true of no other great power; certainly it is true of no insular power. This fact bears upon our policy of national defense. It follows that under any possible naval situation, even with our Navy and our fleets denied access to the seas by any conceivable combination of the other great navies of the world, this country could not be defeated and forced to capitulate by naval operations alone.

This, involving, as it does, our unlimited resources of man power and wealth, constitutes our greatest national military asset, provided, and only provided, we are prepared to prevent the landing on our shores of an enemy of the size which our own performance has demonstrated to the world can be landed by a first-class power under certain conditions. These conditions are that it shall have control of the sea and control of proper bases for debarkation. Without the possession of such bases in France we could not have landed our army irrespective of the fact that the Allies had control of the sea.

It is, accordingly, one of the very important lessons of this war that reasonable prevision and a sound military policy demand that there shall be at all times available for immediate use a sufficient trained and organized force to insure, in connection with our fixed coast defenses, that no probable or possible enemy can ever seize a great strategic base on our coast. With such a base in his possession it is not inconceivable that he could, within a short time, land a sufficient number of fully-equipped troops to seize and hold, by establishing a line of defense not incomparable in length with that held by the Germans on the western front, an area including such an appreciable portion of the resources and wealth of the country as to result in consequences of incalculable moment to the Nation.

Obviously such an attacking force, irrespective of its power on the sea, as represented by the strength of its Navy, and of its power on the land, as represented by the strength of its Army, will be at its weakest during the period it is attempting to land its army on our shores. During this period only will it be possible to nullify any numerical superiority of troops that he may bring to bear by the resistance of a trained and organized force of relatively small size. Only by the provision of such a force can we be assured that we shall be able to utilize to full advantage our greatest military asset, by gaining the time required to develop our resources and to organize an army which will be adequate to any contingency. The size of such a force, which is essential if the country is to be afforded that degree of protection which a sound military policy requires, must be determined by a consideration of our extended coast line, by the necessary dispersion of the force due to the distance from coast to coast, and by the necessity of providing for the safety of the Panama Canal and our other insular possessions.

Peace strength of Army.—The minimum force which, in my opinion, is adequate for this purpose is one field army of five corps, skeletonized to about 50 per cent of its strength, in such a way as to include a nucleus for all organizations which require extended training and instruction in time of peace, and as to be capable of ready expansion, in time of war to full strength without seriously impairing its efficiency for service.

Universal military training.—With such a force, and with a system of universal training which will insure an adequate reserve of officers and men to enable it, in case of emergency, to be expanded by Congress to such an extent as may be required, no foreign country could, in view of our performance in this war, disregard our rights or our military power. Such a system of universal training, which can be arranged so as to afford a negligible interference with the industrial and educational activities of the individual or of the nation,

will, by developing physically, mentally, and morally the youth of the country, make them better citizens as well as better soldiers. The force which I have indicated as being the minimum required by a sound military policy for the adequate protection of the country, could, without increase and without serious impairment to its efficiency, be utilized in time of peace to furnish, in great part at least, the trained, professional military specialists required to conduct efficiently such a system of intensive universal military training.

I have outlined some of the considerations which, in my opinion, must, in connection with the study of the experiences of the war, be regarded as bearing directly upon our national military policy.

Definite military policy now possible.—For the first time in its history this country is now, as the result of the war, in a position to formulate a definite military policy. All studies which have been made in this connection prior to the war have, necessarily, been academic. There has existed no supply of trained officers or men or of equipment and stores commensurate with the requirements of such a policy. No definite or adequate policy could be formulated which did not contemplate universal military service in time of war as the source of a national army; no precedents existed which warranted the assumption that such a system would be accepted by the country. Any war plans that might be prepared could only provide, on paper, for the disposition to be made of armies and supplies that did not exist, which could not be made available in case of an emergency and which could only be created by slow and evolutionary processes the nature of which could not be foreseen. Such plans were necessarily academic. To-day the entire situation is changed. The country has universally accepted and demanded, as the only rational and equitable solution of the problem that the great army required for our participation in this war be raised by the draft, and the nation-wide support of the draft act and the general satisfaction with its operation and its results can leave no doubt but that it may be accepted as the future policy of the country in time of war.

There are to-day in the country nearly 4,000,000 men and 200,000 officers physically and mentally fit and trained for war. No such reserve exists in any other country. It may be relied upon to meet the requirements of any possible contingency that may arise within the next five years. There is also a reserve of artillery, ammunition, motor transport, machine guns, rifles, and other military essentials that will amply provide for any possible requirement in the near future.

There exist complete cantonments, flying fields, firing and training centers, storehouses, and port terminals which will in general provide for any probable future requirements of peace or of war; steps have been taken to provide an adequate transport reserve, operating commercially but under American title and available on short notice for use in an emergency; the industries of the country have been trained to produce, with the minimum of delay, in time of necessity, the war materials which they are best adapted to produce, great plants have been constructed for the manufacture of explosives, and there exists an army of skilled workmen trained in the manufacture of every kind of military matériel. All this constitutes a national military asset of incalculable but in part of temporary value.

It makes possible now, as never before, the formulation of a definite military policy, which, by a reasonable and moderate utilization of the present and the future resources of the country, will insure, beyond all peradventure, that the future of the Nation will be safeguarded for all time. Had such a force and such a system of training as is above outlined been in existence in this country at the outbreak of the war, it is probable that Germany would not have dared, by the violation of the rights of this country under international law, to have brought the United States into the war. In fact, had such a force and system been in existence in England in 1914, it is, in the light of subsequent events, by no means improbable that Germany would never have begun the war at all.

During the period, of approximately one and one-half years, of our participation in the war, the War Department expenditures were approximately \$14,000,000,000 and the total war expenditures of the country were approximately \$24,000,000,000. The interest on either of these amounts would maintain indefinitely the scheme above outlined. Not only would it provide an army which would, in any case, have resulted in a material saving in the cost, not only in money but in lives as well, of the war to this country, but it would also provide for a system of universal military training which, in addition to being a military asset of incalculable value, would constitute a most potent factor in Americanizing and educating the great alien and illiterate population which otherwise, under the influence of unscrupulous and disloyal agitators, may become a national menace. That such an investment would be sound from the standpoint of national military policy is, in my opinion, indisputable; I am convinced that from the standpoint of national business and economic policy it is equally sound.

I have indicated in this report some of the lessons of the war which appear to be of special significance at this time. Such action as it has been possible to take, under existing legislation, to profit by these lessons, has already been taken.

Legislation proposed.—Since the submission of my previous report the study of the plan for the reorganization of the Army in the light of the experience that has crystallized out of the war, to which reference was made in that report, has been completed and, in the form of proposed legislation, has been submitted to you, with the recommendation that it be transmitted for the consideration of Congress. A copy of the proposed bill is appended to this report.

Conclusion.—In concluding this report I desire to express my appreciation of the splendid work of some of the many agencies that have, by their cooperation and assistance, contributed materially to the development and execution of the Army program. In the national mobilization that has been necessary every profession, industry, and trade has responded. The skill and advice of the eminent engineers, professors, physicians, scientists and business men who have put their services at the disposal of the War Department, either as officers or as civilians, have been to a large degree responsible for much of the progress made in the development in matériel and in organization. Without the unremitting labor of many of the governmental agencies outside the War Department, including the Railroad Administration, the War Industries Board, and the Shipping Board which have participated actually in the work of equipping and trans-

porting the Army, it would have been impossible to have accomplished the results that have been attained.

The work of the affiliated welfare organizations (Y. M. C. A., Y. W. C. A., National Catholic War Council, Jewish Welfare Board, the American Library Association, the War Camp Community Service, and the Salvation Army), as well as that of the many individuals, both men and women, who, in Red Cross work, theatricals, and in innumerable other ways labored unceasingly without regard to hours and weather for the welfare of our officers and enlisted men, has been a powerful factor in the maintenance of the matchless morale of our troops both in this country and overseas.

The thorough and efficient cooperation of the Navy made possible the transport of our Army overseas without the loss of a transport while under their protection on the eastbound voyage.

The Regular Army has imparted to the entire Army its standards and its ideals of duty, efficiency, loyalty, and justice. In the performance of the many responsible duties that it has been called upon to perform both in this country and overseas, it has lived up to its traditions and has added laurels to its history.

The American soldier, from whatever source, has, by his conduct, and by his self reliance, cheerfulness, initiative, aggressiveness, and valor, won the confidence and the unstinted praise of his comrades in arms of all nations. The magnificent performance of Gen. Pershing and his command in this war will always be a source of pride to all Americans.

P. C. MARCH,
General, Chief of Staff.

REPORT OF THE ATTORNEY GENERAL.

DEPARTMENT OF JUSTICE,
Washington, D. C., December 8, 1919.

To the Senate and House of Representatives of the United States of America in Congress assembled:

I have the honor to submit a report of the business of the Department of Justice during the fiscal year ended June 30, 1919, together with the renewal of recommendations of former years, some recommendations for new legislation, and a brief résumé of operations of recent date.

RECOMMENDATIONS.

ARREST AND REMOVAL OF PERSONS INDICTED FOR CRIME.

In its provision for the removal of indicted persons to the districts where the indictments were returned the Federal criminal procedure is grievously defective. A person indicted in a particular district, if found in another district, may successfully resist removal if a United States commissioner in the district where he is found is willing to find lack of probable cause; or he may give bond to appear, fail to do so, and, upon forfeiture of his bond and further removal proceedings, give a second bond, and so on indefinitely. Certain persons indicted for grave felonies enjoy absolute asylum within the United States and practical immunity from prosecution.

It is notorious that removal proceedings are more cumbersome, expensive, and uncertain than extradition proceedings.

As the criminal process of a State after indictment runs to any place within the State, so should a Federal warrant run to any part of the United States after indictment, but with privilege to the defendant to give bail.

This defect in the Federal criminal procedure has been frequently pointed out by my predecessors in previous reports.

I therefore urge that section 1014, Revised Statutes of the United States, be amended so that the judge into whose court an indictment is returned may consider the testimony introduced before the grand jury and enter an order making the warrant of arrest run to all parts of the United States.

KILLING A FEDERAL OFFICER.

Section 140 of the Criminal Code should be amended, making it a crime to kill an officer of the United States in the circumstances described in that section. Under section 140 of the Federal Penal Code it is a crime to assault, beat, or wound an officer of the United States engaged in serving or executing process, but there is no Federal law making it a crime to kill an officer under such circumstances.

SENDING THREATENING LETTERS.

It is no offense under existing law to send threatening letters through the mails unless in furtherance of a scheme to defraud or as a means of accomplishing extortion. Letters threatening injury to life or property may be sent with impunity. The law should be made to cover such cases.

THEFTS OF GOVERNMENT PROPERTY.

The uncertainty as to punishment prescribed in section 36 of the Federal Penal Code, which provides that thefts of property of the United States furnished for military or naval service shall be punished as prescribed in section 35, should be removed. The punishment for its violation being thus uncertain, section 36 is of little force.

PRESENCE OF STENOGRAPHERS BEFORE GRAND JURIES.

Attention was previously called to the division of opinion in the Circuit Courts of Appeals and district courts on the question as to the legality of having a stenographer present to report proceedings of grand juries. I again recommend that in order that all doubts may be removed the presence of a stenographer in the grand jury room for the purpose of reporting the proceedings should be specifically authorized by statute.

DEFRAUDING THE UNITED STATES.

There is great need for a statute punishing a single individual who defrauds or attempts to defraud the United States in any manner or for any purpose. Section 37 of the Federal Penal Code punishes two or more persons who conspire to defraud the United States "in any manner or for any purpose."

ASSIGNMENT TO OCCASIONAL SERVICE OF UNITED STATES DISTRICT JUDGES.

In the Annual Report of the Attorney General for 1918 attention was called to the fact that the business in the district courts and circuit courts of appeals frequently is of such character and volume as

to demand for its dispatch some assistance to the judges regularly sitting therein. Limited provision for such emergencies has already been made by existing law, and there would seem to be no reason why the entire Federal judiciary should not be made as mobile a force as possible.

The act of October 3, 1913 (38 Stat. 203), amending section 18 of the Judicial Code, provides that the Chief Justice may, if in his judgment the public interests so require, designate and appoint the judge of any district court in another circuit to hold a district court within the second circuit. I recommend an amendment to said section of the Judicial Code so as to extend its provisions to all circuits.

PREPARATION AND PRINTING OF RECORDS.

There is great need for legislation with reference to the costs incurred in the preparation and printing of the records of cases in the appellate courts. The act of February 13, 1911 (36 Stat. 901), entitled "An act to diminish the expense of proceedings on appeal and writ of error or certiorari," has led to confusion in the matter of fees and charges. A bill to clarify the matter will be prepared shortly in this department and submitted to the chairmen of the appropriate committees in Congress.

THE JUVENILE COURT.

The judge of the juvenile court has submitted suggested amendments to existing laws affecting the jurisdiction of the juvenile court of the District of Columbia, together with notes explanatory thereof, all of which will be found in Exhibit 31, page 636, of this report. These amendments are designed to meet situations which have arisen or defects which have become apparent to the judge during the year of service which she has just completed, several of which suggestions have also been made from time to time by her predecessors.

THE STATUTE OF LIMITATION IN BANKRUPTCY CASES.

Criminal prosecutions under the bankruptcy act must be brought within one year as the law now stands. This seems too short a period. Unquestionably it has defeated justice in some cases. To illustrate, most of the cases of embezzlement by trustees in bankruptcy have been disclosed by the periodical examinations of the offices of referees in bankruptcy conducted by this department. Speaking generally, it has never been found possible to conduct such investigations oftener than once every two years, except, of course, where there was reason to suspect wrongdoing. It frequently happens, therefore, that by the time such embezzlements are discovered the statute of limitation has barred prosecution. The period of limitation in such cases should be extended to three years.

AMENDMENT OF THE BANKRUPTCY LAW.

Referees in bankruptcy should be placed upon the same plane as were clerks of the United States district courts prior to July 1, 1919, by fixing a maximum limit for their compensation and requiring them to pay the excess into the Treasury of the United States.

Provision should also be made for the appointment in each district of one or more official trustees to take possession of a bankrupt's property automatically upon adjudication, or upon order of court in case of a contested adjudication. This would obviate the appointment and consequent cost of receivers, would prevent much scandal growing out of alleged manipulations of trusteeships and estates by referees and attorneys, and would bring to the trustee's office the benefits resulting from experience.

It should be made an offense to conceal assets not only from the trustee, as now provided by section 29*b* (1) of the statute, but also from any officer of the court charged with control and custody of property, including, for example, receivers and in certain cases the referee or the United States marshal.

The statute [sec. 14*b* (2)] now, in substance, forbids the discharge of a bankrupt if he has destroyed, concealed, or failed to keep proper books of account, with intent to conceal his financial condition. It seems desirable that, upon a showing by objecting creditors that the books have been destroyed or concealed or have not been kept, the burden of showing that that situation was not brought about with the specific intent mentioned should be placed squarely upon the bankrupt and not upon the objecting creditor. Similar action should be taken with respect to the burden of proof where there is a *prima facie* showing of the other grounds for refusal of discharge set out in paragraphs 3 and 4 of section 14*b*.

FEDERAL PAROLE AND PARDON BOARD.

The duty of passing on parole and pardon cases is an increasingly onerous one. The duties of the Attorney General in recent years have increased so greatly that it has become practically impossible for him to give to these cases the attention and thought which they require. It appears desirable that a board be created for the purpose of passing upon and recommending action to the President in pardon cases and for the purpose of finally approving paroles granted by the parole boards established at institutions where Federal prisoners are confined. It is recommended that a board of three men be constituted and fully empowered to handle this work. The jurisdiction over Federal penal institutions should also be vested in this board.

INCREASE IN PER DIEM FOR SUBSISTENCE WHEN TRAVELING ON
OFFICIAL BUSINESS.

Because of the increase in rates charged by hotels, restaurants, and dining cars, which, particularly in the larger cities, are two to three times in excess of the rates which obtained prior to the war, the allowance of \$5 a day for actual expenses of subsistence, or \$4 a day in lieu thereof, to officials and employees of the Government when absent from their designated headquarters on official business, is now grossly inadequate, and the officials and employees of this department have been compelled to pay the difference from their salaries. This amounts to a reduction in their compensation and is a genuine hardship.

To meet this condition and to relieve officials and employees of the Government from the personal payment of expenses of subsistence incurred solely in connection with the discharge of official business, it is respectfully suggested that the act of April 6, 1914 (38 Stat., 318), be amended to allow actual expenses of subsistence to the maximum of \$7 a day, and that section 13 of the act of August 1, 1914 (38 Stat., 680), be amended to authorize a per diem rate of allowance not exceeding \$6 in lieu of subsistence.

REAPPRAISEMENT IN CUSTOMS CASES.

Under the law as it now stands importers can (by an indirect method) get to the Court of Customs Appeals for what is practically a review of some of the questions of law involved in decisions on appeals to reappraisement. The Government has no such right of review. The Government's right of review ought to be coextensive with that enjoyed by importers.

Further, there are now three final reappraising boards which consider questions of fact and of law. As the three boards have concurrent jurisdiction, there is the natural result of conflicting and irreconcilable rulings on questions of law. Uncertainty could be eliminated by providing for a further appeal on questions of law to one final tribunal.

I renew the recommendation that the statutes be so amended as to permit both importers and the Government to appeal on questions of law directly from reappraising boards to the Court of Customs Appeals.

PORTRAITS OF JUSTICES OF THE SUPREME COURT OF THE UNITED STATES.

There is at the present time no complete set of portraits of the justices of the Supreme Court. Albert Rosenthal has painted a very fine set of portraits of the following Supreme Court justices:

1. Blair.	10. Wayne.	19. McKinley.
2. Chase.	11. Iredell.	20. Cushing.
3. Willson.	12. Moore. *	21. Brewer.
4. William Johnson.	13. Paterson.	22. Harlan.
5. Thomas Johnson.	14. Washington.	23. Brown.
6. Duval.	15. Livingston.	24. Peckham.
7. Trimble.	16. McLean.	25. Moody.
8. Todd.	17. Baldwin.	26. Lurton.
9. Thompson.	18. Barbour.	27. Daniel.

It appears desirable that the Government have a complete set of portraits of this nature and I recommend that this set, which is the only available one in existence, be purchased by act of Congress for the Government.

These portraits, with two exceptions, are now on exhibition in the Library Committee room of the National House of Representatives.

DEPARTMENTAL ACTIVITIES.

Shortly after my induction into office I effected a reorganization of the personnel of the Department of Justice. Coincident with this reorganization it became necessary to very considerably enlarge the activities of the department because of the new statutes which had placed larger investigational duties upon the Attorney General, and to this end an Assistant Attorney General was given entire charge of work of this character in the department. Theretofore an Assistant Attorney General had been the general administrative officer and he was also charged in a supervisory way with all investigational activities. In order to have available an Assistant Attorney General to place in charge of this work it was necessary to transfer the department's administrative duties to the chief clerk, Mr. C. E. Stewart, and under his new assignments he became in reality administrative assistant to the Attorney General. The additional duties and responsibilities thus imposed cover the entire business of the Division of Accounts, the office of the appointment clerk, the office of the disbursing clerk, and the office of the librarian. Matters involving the authorization of expenditures, both in the department in Washington and in the field, and those involving appropriations for contingent expenses, as well as salaries and expenses of officials in the field, and approximating \$4,000,000, were placed in charge of this officer.

In line with my general scheme for reorganization, early in my administration I transferred the force of examiners from the Bureau of Investigation to the Division of Accounts, thus bringing them within the jurisdiction of the chief clerk. This change facilitates both the work of the Division of Accounts and that of the examiners, transfers from the Bureau of Investigation a class of employees whose duties are closely allied with those of accountants in the department and relieves the officers of the United States courts from examination or investigation by a force whose primary duties are the investigation and prosecution of crimes. In addition to continuing and completing general examinations of offices of court officials previously commenced, examinations were instituted during the fiscal year 1919 in 24 other districts and about 35 special investigations were made relating to the manner of conducting business, the personal habits and conduct of officials, etc. The activity of the examiners has resulted in great benefit to the service by the improvement of standards and ideals pertaining to official duties as the outgrowth of constructive supervision.

The following is a brief statement of the status of various suits and actions based upon facts developed by the examiners:

1. The suits instituted some years since in the northern district of Illinois to recover from clerks and former clerks of United States courts moneys accruing as interest on official accounts are now pending in the Supreme Court and will probably be heard during the present calendar year.

2. In the test cases instituted in the eighth circuit to recover from referees moneys which the Government claimed they had collected improperly as fees and expenses, the Court of Appeals sustained the Government's right to sue on the bonds of the referees and remanded the cases.

3. A suit in the same circuit to determine the proper allowance to a district clerk for notices to creditors in bankruptcy was still pending at last report.

4. A suit instituted by a trustee in bankruptcy in the ninth circuit at the desire of the department was decided by the Court of Appeals in favor of the Government's contention that a referee in bankruptcy is not entitled to commissions on the costs of administration. (See *Simpson v. Laffoon*, 258 Fed., 229.)

5. Criminal cases against a former district clerk in the fifth circuit, who had misappropriated cost funds, were disposed of by pleas of guilty and a fine.

6. Criminal cases against another ex-clerk in the same circuit for similar offenses are still pending, but will probably be tried during the present fiscal year.

7. An investigation by an examiner in the eighth circuit in behalf of the Interior Department resulted in the indictment of three persons in connection with frauds relating to public lands. These cases are now awaiting trial.

8. One of the war contract investigations in another circuit revealed apparently extensive irregularities, resulting in the indictment of three persons. These indictments are now pending.

The examinations continue to disclose large individual incomes of referees in bankruptcy. This condition emphasizes the desirability for the appointment of official trustees, as heretofore recommended. In this connection attention is invited to the recent act of the Canadian Parliament which makes such provision. Under that act, as the provisions are understood here, trustees are appointed by the governor in council upon application made to the secretary of state of Canada. Every applicant for such appointment must state in his application full particulars of his qualifications, ability, and previous business experience. He must give general security to the King in a sum not less than \$10,000, and special security in special cases. Apparently he performs a number of the duties imposed in this country upon referees.

That act also includes a section limiting the compensation of attorneys for the trustee or the bankrupt estate.

The average number of examiners at work during the year was 12, others being diverted to war work or the Army. This condition has been corrected by the employment of additional examiners so that the number at present under appointment for field service is 18.

Further in accord with the reorganization I enlarged the duties which were theretofore assigned to the private secretary and assistant to the Attorney General, Mr. R. T. Scott, placing him in charge of the approval and recommendation to me of all classes of authorizations other than those charged to the chief clerk, of consideration and investigation of the qualifications of candidates for appointment to the field service, including the reviewing and collating of indorsements and the holding of personal interviews with applicants and those favoring or opposing appointments. He has also been charged with the duty of receiving complaints, initiating investigations, and preparing recommendations for the Attorney General where charges are made of misconduct or unfitness for office of United States attorneys, marshals, and other employees of the department, and reviews and makes recommendations in all matters relating to questions of general policy and the appointment of notaries public in the District of Columbia.

Appropriations made and amounts used thereunder for the Department of Justice and the courts of the United States for the fiscal year 1919 are set forth in detail in Exhibit No. 4; including special items, they aggregate \$17,126,725.43,¹ and \$16,219,340.02, respectively.

The estimates of appropriations needed for the fiscal year 1921, beginning July 1, 1920 (excluding estimates transmitted to the Commissioners of the District of Columbia, covering District items, and those transmitted to the Secretary of the Interior, covering Territorial items), aggregate \$17,914,471.35, an increase of \$3,899,954.35 over the like appropriations and \$2,084,060.70 over the like estimates for the fiscal year 1920, which commenced July 1, 1919.

The major causes contributing to the increases above mentioned are as follows:

- (a) Increased cost of supplies and equipment.
- (b) The change in the statutory salaries of United States judges.
- (c) The special and exceptional activity and prospective activity of the Bureau of Investigation.
- (d) The heavy increase and prospective further increase in the business transacted in the courts of the United States, both civil and criminal.

- (e) The heavy expense incident to the maintenance of a large number of Federal prisoners.

The estimates submitted through the Commissioners of the District of Columbia, which are not included in the figures given above, aggregated \$257,840, and those submitted through the Secretary of the Interior, \$125,000.

Because of the vast increase of the work in the department on account of war activities and the natural increase in business it was necessary to augment the force both in Washington and in the field service, although the limited appropriations prevented an increase in the force proportionate to the increase in business. This condition has necessitated an extension of the working hours of the majority of the officials and employees of the department, some of whom have forfeited vacations and given to the Government from 10 to 12 or more hours a day. It therefore affords me pleasure to find this opportunity to record my appreciation for the devotion of my entire staff to the interests of the Government. During the last fiscal year the personnel numbered approximately 525, including 18 officials in the legal and administrative branches, 67 attorneys, 344 clerks and special employees, and 96 subclerical employees, as against an approximate total of 427 of the year before, including 22 legal and administrative officers, 63 attorneys, 254 clerks, and 88 subclerical

¹ This amount does not include items carried by the deficiency act approved Nov. 4, 1919.

employees. The staff outside of Washington consists of 88 United States attorneys, 88 United States marshals, and approximately 160 special assistants to the Attorney General and to United States attorneys, 170 regular assistants to United States attorneys, 260 clerical assistants to United States attorneys, and 1,500 other employees.

Upon the request of the Committee on the Judiciary of the Senate the question of the sufficiency of the statutory salaries of United States marshals and United States district attorneys was investigated by the department. In order to obtain a satisfactory basis for general comparison statistical tables were prepared showing the average business and expenditures of the respective districts for a period of four years. These tables were considered in connection with special or peculiar conditions known to exist in specific districts.

The following schedule showing the present salaries of these officials and the salaries recommended, indicates the results reached by the department in this matter:

Judicial districts.	Present Salaries.		Recommended salaries.	
	Attorneys.	Marshals.	Attorneys.	Marshals.
Alabama:				
Northern.....	\$4,000	\$4,000	\$5,000	\$4,500
Middle.....	4,000	4,000	4,500	4,000
Southern.....	3,000	3,000	3,500	3,000
Alaska:				
First division.....	5,000	4,000	6,000	5,500
Second division.....	5,000	4,000	6,000	5,500
Third division.....	5,000	4,000	6,000	6,000
Fourth division.....	5,000	4,000	6,000	6,000
Arizona.....	4,000	4,000	5,500	5,000
Arkansas:				
Eastern.....	4,000	4,000	5,000	4,500
Western.....	4,000	4,000	4,500	4,000
California:				
Northern.....	4,500	4,000	6,500	6,000
Southern.....	4,000	4,000	5,000	5,000
Colorado.....	4,000	4,000	4,500	4,500
Connecticut.....	4,500	2,500	4,500	3,500
Delaware.....	2,000	2,000	3,000	3,000
District of Columbia.....	6,000	5,500	6,500	6,000
Florida:				
Northern.....	3,500	3,000	4,500	3,500
Southern.....	3,500	3,000	4,500	4,000
Georgia:				
Northern.....	5,000	5,000	6,500	5,500
Southern.....	3,500	3,500	5,000	4,500
Hawaii.....	4,000	3,000	4,500	4,000
Idaho.....	4,000	4,000	4,500	4,000
Illinois:				
Northern.....	10,000	5,000	12,000	6,500
Eastern.....	5,000	4,500	5,500	4,500
Southern.....	5,000	4,500	5,000	4,500

Southern.....	4,500	4,000	5,000	4,500
Wisconsin:				
Eastern.....	4,000	4,000	4,500	4,000
Western.....	4,000	4,000	5,000	4,500
Wyoming.....	4,000	3,500	4,500	4,000

The salaries which are fixed by law and the limits which are also fixed by law and appropriations as to many other salaries have not advanced, even approximately, in proportion to the advance of the cost of the necessities of life. Hence, there have been many resignations, not only among major officials, but on the part of assistant attorneys and clerks, deputy marshals and others, and much difficulty has been experienced in obtaining capable and satisfactory incumbents for official positions.

BUREAU OF INVESTIGATION.

WILLIAM J. FLYNN, Director.

1. WORK AND ORGANIZATION.

As stated in the annual report for the fiscal year ended June 30, 1918, the work of the Bureau of Investigation during that year was concerned very largely with matters arising out of the war. This condition continued through approximately the first half of the fiscal year ended June 30, 1919. Up to about the time of the signing of the armistice the number of special agents of the bureau continued to increase. Between November, 1918, and January, 1919, the number remained about stationary. Between January, 1919, and July, 1919, the number appreciably decreased. Since the latter date, because of increasing work, particularly in connection with the radical situation and the high cost of living, there has been a slight increase in the number of special agents.

On February 10, 1919, Mr. A. Bruce Bielaski, who had been chief of the bureau since April 30, 1912, resigned his position. Mr. William E. Allen, assistant to the chief of the bureau, became acting chief for the period which ended June 30, 1919. On that date the Attorney General directed that the bureau be placed under the direct supervision of the Attorney General's office. Pending such time as an assistant attorney general should be appointed to undertake this duty, Mr. John T. Creighton was designated to supervise the bureau. Mr. William J. Flynn, formerly Chief of the Secret Service of the United States Treasury Department, later Chief of the Secret Service and Police Section of the United States Railroad Administration, was appointed director of the bureau, and Mr. Frank Burke, formerly operative in charge of the New York office of the Secret Service Division and later in charge of the New York office of the Secret Service and Police Section of the United States Railroad Administration, was appointed assistant director and chief.

The signing of the armistice did not end the war activities of the bureau. Many violations of law which occurred during the period of active hostilities were reported to the bureau after November 11, and a very large though decreasing number of such reports are still being received.

It may be said, however, that the pressure of war work for the bureau is ended. In its stead the bureau is confronted with a very large and important task in connection with social and economic unrest which in part has grown out of the war. Unrest and radicalism are rife throughout the world; the United States is not exempt. The Department of Justice as the law-enforcing agency of the Government is deeply concerned with this situation, and the Bureau

of Investigation of the department has probably accumulated a greater mass of data upon this subject than is anywhere else available. Although ordinarily the bureau is concerned with the investigation of individual violations of law, in the matter of the radical situation it has consistently taken the attitude that intelligent investigations of individuals can be accomplished only by a thorough-going understanding of the situation as a whole. To this end there has been organized in the Bureau of Investigation a division of radical activities, the work of which is covered in more detail in another portion of this report.

2. DETECTION OF VIOLATIONS OF FEDERAL LAW.

Very important work has been done by the bureau during the year in connection with cases of alleged fraud in contracts between the Government and private firms. Many of these cases are exceedingly intricate, involving large sums of money. Among the larger investigations of this nature which have been completed are those concerning Coastwise Lumber & Development Co., the Air Nitrates Plant at Muscle Shoals, Ala., and Hog Island shipyard. These investigations will continue in considerable volume for some time.

The bureau has been charged with responsibility for the investigation of cases arising under the Reed-Jones amendment and section 240 of the Criminal Code, as well as cases arising under the war-time prohibition act. Many of these cases, because of the irresponsible character of the persons involved, have consumed an amount of time and effort on the part of agents of the bureau which have seemed out of proportion to the importance of the individual cases. The bureau has taken the position, however, that the successful investigation of these cases was necessary if for no other reason than to secure respect for Federal law. The effect of such investigation and the consequent prosecution has been particularly gratifying in the districts surrounding military camps, navy yards, etc., and in addition they have probably been a deciding factor in keeping at a minimum disturbances growing out of the steel strike.

The relations between the Bureau of War Risk Insurance and the Bureau of Investigation have been very close. Since July 1, 1918, the bureau has investigated about 3,000 cases arising under the war-risk insurance act. These investigations include:

1. Cases pertaining to contemplated awards of Government allowances where allotments had been made under circumstances which naturally raised the question of the validity of the claim of the allottee.

2. Cases where exemption was claimed from compulsory allotment and allowance by the enlisted man.

3. Cases where the dependency was not of such nature as to come within the provisions of the act, or the allottee was morally unfit to receive a Government allowance.

4. Cases of fraud.

As a result of these investigations, 1,400 cases have been assigned to United States attorneys for attention. More than 1,000 photostatic records of the bureau's files, together with briefs of the documentary evidence prepared by the legal division of the Bureau of War Risk Insurance, have been submitted to the United States attorneys. A considerable number of convictions have been secured in these prosecutions. Twenty-five hundred checks issued by the Bureau of War Risk Insurance have been intercepted by the agents of this bureau and returned to the Treasury. The checks thus actually intercepted approximate \$25,000, and the refunds actually secured by the activities of the bureau's agents probably amount to a similar total. These actual interceptions and refunds, however, represent but a small part of the value of the work of the bureau's agents. Information that such transactions are being closely watched spreads rapidly. There can be no doubt that a sum much larger than that mentioned above has been saved to the Treasury by the fear that attempted fraud would be detected.

Ten thousand investigations have been made in connection with alleged violations of sections 12 and 13 of the selective-service act; and under sections 5 and 6, 300,000 investigations have been inaugurated and completed, 95 per cent of which were delinquents. It is believed that 50,000 of these latter cases will develop into willful delinquencies for which indictments will be returned. A large number of deserters from the Army and Navy have been apprehended and delivered to the different camps for trial by courts-martial. The total number is approximately 1,500.

The work of the bureau in connection with the investigation of alien enemies continued actively during the first half of the year. Since that time, however, this work has very rapidly decreased. Additional details regarding this work are given in another portion of this report. Since the signing of the armistice the work of the bureau in this connection has very rapidly decreased and at the present time consists largely of investigations regarding interned alien enemies who wish to be paroled or whom it is thought desirable to have repatriated, and of investigations in connection with the granting of presidential exceptions to the alien enemy classification for purposes of naturalization.

While the work does not come within the fiscal year technically covered by this report, it seems desirable at this point to call attention to the work of the bureau in connection with the efforts of the department to reduce the high cost of living. Under date of August 11, 1919, the special agents in charge of the bureau's field offices were

instructed to cooperate with United States attorneys with all their available facilities in making the profiteering and living cost investigations. They were instructed that "such investigations must be given precedence over all matters, excepting such as are of pressing public importance or of emergency character." As a result of such instructions the situation in the entire United States was investigated by agents of the bureau who made detailed reports to the various United States attorneys and to the Washington office. Special arrangements were made in the Washington office for the critical inspection of these reports and for the coordination of the efforts of the field agents.

These investigations in many instances have been exceedingly difficult to carry to a successful conclusion because of the widespread activities of many business establishments engaged in these lines. In the case of one firm, for instance, which was believed to be hoarding sugar, it was necessary to conduct investigations in 95 cities and to bring all the evidence so accumulated together at Washington in order to ascertain whether or not the stocks carried by this company were in the aggregate excessive. Without the bureau organization this sort of investigation could not have been conducted. The material so collected is being made the basis of the present national campaign against the high cost of living.

On August 1, 1919, a definite division of the bureau was formed to deal with radicalism. As mentioned elsewhere in this report, the work of the bureau in this regard has not resulted in a large number of criminal prosecutions since the armistice by reason of the present state of permanent legislation on this subject. The Federal statutes are exceedingly limited in so far as they affect persons of American citizenship engaged in radical agitation. The efforts of this division have, therefore, been largely centered upon the activities of alien agitators with the object of securing the deportation of such persons. To this end very close relations have been established with the office of the Commissioner General of Immigration. Already this policy has shown results and it is believed that in the near future this country may be freed of the presence of a considerable number of undesirable aliens who have come as missionaries of unrest rather than as emigrants from oppression. Organized as it is, the work of this division is cumulative and the results of its work will be increasingly manifest.
